Using predictive analytics, businesses move away from overstocking or understocking, while ensuring timely delivery of fresh products. This boosts customer confidence and satisfaction levels while reducing wastes.

5. Accurate Demand & Price Forecasts

AI facilitates precision in demand and price forecasting with the help of historical data and market trends. Food companies, especially dealing in perishable products can adjust their production and drive efficient inventory management with AI. Besides, such companies can price their products competitively and take advantage of consumer behavior and market fluctuations.

6. Reduced Emissions & Promotes Sustainability

AI in the food industry contributes towards reducing emissions as supply chains get optimized and food waste gets minimized. With predictive analysis, crop yield increases, agriculture precision is achieved, and carbon footprint of companies reduces. Energy-efficient processing and distribution have minimal environmental impact.

7. Make Supply Chains Resilient

Real-time data analysis offers predictive insights of the market demands. AI can help identify potential disruptions and facilitate proactive adjustments, be it in sourcing, operations, or distribution. Supply chains become robust and stabilize even in the face of challenges.

The collaboration with Throughput.ai led to substantial improvements for Church Brothers Farms, including a 40% increase in short-term forecasting accuracy and a more efficient management of inventory and production capacity. By achieving the 5 R's—having the right stock in the right quantity, at the right cost, time, and location—the company not only maximized profitability but also enhanced customer satisfaction through its optimized supply chain.

AI in Food Product Development

AI technologies are enhancing the diagnosis and prevention of food contamination thanks to their sophisticated data processing and pattern recognition skills.

1. Food Contamination Detection - AI technologies utilize sophisticated data processing and pattern recognition skills to diagnose and prevent food contamination. By analyzing vast volumes of data from sensors, cameras, and historical records, AI can identify potential hazards and alterations in food production processes.

2. Quality Control and Shelf Life Prediction - AI-powered algorithms quickly identify pollutants like germs, pathogens, and foreign materials, reducing the risk of tainted products

reaching customers. These algorithms also forecast product shelf life, aiding in reducing food waste and spoilage.

3. Predictive Analytics for Quality Control - AI-driven predictive analytics models enable proactive actions to maintain quality control throughout the food supply chain. By analyzing data from various production and distribution chain points, AI can detect patterns and trends indicating potential quality issues and take prompt corrective action.

4. Environmental Monitoring - AI systems track and evaluate environmental factors such as temperature and humidity to maintain optimal storage conditions for perishable items, ensuring product freshness and safety.

5. **Food Fraud Prevention -** AI algorithms detect discrepancies and anomalies in data from ingredient origins, supplier records, and quality certifications, aiding in the prevention of food fraud. This enhances customer confidence and transparency by ensuring the authenticity and traceability of food products

- **Flavor and Ingredient Optimization -** AI algorithms analyze sensory data, consumer input, and ingredient attributes to find the perfect blend of flavors and ingredients. This optimization helps food producers create new goods or improve existing ones to better meet customer needs and stand out in the marketplace.
- **Personalized Nutrition -** AI algorithms produce customized nutrition regimens by analyzing dietary limits, preferences, and personal health data. Customers can make educated decisions about their dietary needs, considering factors like age, gender, exercise levels, and specific dietary requirements.

Future Trends and Predictions of AI in the Food Industry

New-age AI technologies in the food industry have started a revolution in how food is produced, processed and distributed. AI-powered tools in supply chains like Throughput are making accurate demand forecasting reducing overproduction and underproduction.

Additionally, Artificial Intelligence has taken food safety to another level. Be it consumer health, detection of contaminants, or offering personalized nutrition plans, the scope of AI and futuristic technologies have unlocked potential that can make the industry sustainable, healthier and secure.

Further, AI-driven logistics solutions will make route planning for deliveries precise and more effective as these solutions work with real-time traffic conditions, weather forecasts and delivery windows.

CONCLUSION

Delving into AI projects presents a thrilling journey filled with limitless opportunities for creativity and development. For those aiming to deepen their understanding and master the intricacies of AI and Machine Learning, Artificial Intelligence has taken over most of the businesses. Relying blindly on AI for crucial decisions is still doubtful owing to non-transparency in the route of concluding. To solve the problem, humans have developed explainable AI that maintains transparency over its actions and helps humans get explanatory results from AI algorithms. Consequently, fuel usage will be more efficient and delivery times reduced. Combined with blockchain technology, AI is set to enhance product traceability from farm to table while ensuring compliance with food safety protocols.

Technological adoptions in the F&B industry are helping companies ace key areas of operation. For example, Throughput's predictive analytics feature has transformed the supply chain landscape and the logistics workflow for many players, Church Brothers Farmer and the Retail Cafe chain being two great examples as we have seen here.

AI in the food industry is not just about adding another layer of innovative technology to your operations. It has the potential to revolutionize your business, be it food safety, sustainability,

improving operational efficiency, reducing waste, saving money, or strengthening customer relationships.

SMART AI-DRIVEN TOURISM FRAMEWORKS REDEFINING VISITOR EXPERIENCE AND BUSINESS COMPETITIVENESS IN WAYANAD

Mr. Fadil Sainul Abid
Final year BBA IB, Nilgiri College of Arts & Science
Thaloor, The Nilgiris, Tamilnadu
Dr. Karthick.K
Head of the Department & IQAC Co-ordinator,
Department Of Management, Nilgiri College of Arts & Science
Thaloor, The Nilgiris, Tamilnadu

Abstract
Artificial Intelligence (AI) is increasingly redefining the landscape of business innovation, with the tourism and hospitality sector emerging as one of the most promising beneficiaries. This study, titled "AI for Business Innovation: A Focus on Tourism and Hospitality in Wayanad", explores how AI-powered chatbots, sentiment analytics, and SMART AI-driven tourism frameworks can enhance visitor engagement and improve service quality. With tourism being a key driver of Wayanad's economy, the integration of AI tools has the potential to guide personalized itineraries, streamline customer interactions, and encourage repeat stays. Using a descriptive research design, data was collected from a sample of **197 respondents**, comprising tourists, hospitality professionals, and business operators within Wayanad. The findings suggest that AI-powered solutions significantly influence customer satisfaction, service efficiency, and the ability of local businesses to innovate in a competitive market. The study highlights that AI adoption not only improves operational performance but also strengthens Wayanad's position as a sustainable and technology-driven tourism destination. The results provide actionable insights for policymakers, entrepreneurs, and business stakeholders in Wayanad to strategically leverage AI for long-term growth and innovation in the hospitality industry.
KEYWORDS: Artificial Intelligence, Business Innovation, Tourism, Hospitality, Chatbots, Sentiment Analytics, Wayanad.

I. INTRODUCTION

Artificial Intelligence (AI) is reshaping global business practices, with tourism and hospitality emerging as a key sector for adoption. Tools such as AI-powered chatbots, virtual assistants, and sentiment analytics are transforming customer interactions by offering instant support, personalized recommendations, and real-time insights.
Wayanad, a leading tourist destination in Kerala, relies heavily on tourism for its economy but faces challenges like inconsistent service quality and limited scalability. AI provides solutions by enabling 24/7 customer support, enhancing visitor engagement, and guiding structured innovation through SMART AI-driven frameworks.

This study, based on a sample of 197 respondents including tourists and hospitality professionals, explores how AI enhances customer satisfaction, operational efficiency, and business innovation. The findings highlight AI's potential to position Wayanad as a competitive, technology-driven tourism hub.

II. Review Of Literature

1. Artificial Intelligence (AI) has gained prominence in the tourism and hospitality sector due to its ability to enhance personalization, streamline operations, and improve customer experiences. Researchers have highlighted the transformative potential of AI in reshaping service delivery and innovation.
2. Ivanov and Webster (2019)[1] emphasized that AI-driven automation, particularly through chatbots and virtual assistants, is revolutionizing customer service in hospitality by offering round-the-clock engagement and reducing operational costs. Similarly, Buhalis and Yen (2020)[2] noted that AI applications such as sentiment analysis and recommendation systems provide valuable insights into consumer preferences, enabling businesses to deliver highly personalized services.
3. In the Indian context, Kumar and Bansal (2021)[3] observed that AI adoption in tourism is steadily increasing, with emphasis on improving visitor engagement and destination competitiveness. Their study stressed that integrating AI into regional tourism hubs enhances not only customer satisfaction but also business sustainability. Likewise, Singh and Thomas (2022)[4] found that AI frameworks, including SMART-based approaches, help local businesses adopt structured innovation strategies that align with customer expectations.
4. From a global perspective, Li et al. (2018)[5] highlighted how AI applications in tourism contribute to enhanced service quality, effective decision-making, and operational efficiency. In addition, Gajdosik (2021)[6] argued that AI-powered chatbots are becoming indispensable in hotels and resorts for providing seamless booking processes, handling inquiries, and managing customer feedback effectively.
5. Collectively, these studies underscore that AI is not merely a technological advancement but a strategic enabler of business innovation in tourism and hospitality. However, there is limited research addressing the regional adoption of AI in emerging destinations like Wayanad, where tourism is both economically vital and culturally distinctive. This study attempts to fill that gap by investigating how AI-powered tools can influence visitor engagement, service quality, and sustainable business practices in Wayanad's tourism sector.

III. Research Methodology

Component	Details
Research Design	Descriptive study to examine AI impact on tourism and hospitality in Wayanad.
Population	Tourists, hotel/homestay operators, and allied business stakeholders.
Sample Size	197 respondents.
Sampling Technique	Convenience sampling for tourists; purposive sampling for professionals.
Data Collection	Structured questionnaires for tourists; interviews for business operators.
Variables	AI adoption (chatbots, sentiment analytics, SMART frameworks), customer satisfaction, service quality, operational efficiency, business innovation.

Data Analysis	Descriptive statistics, correlation analysis, thematic analysis for qualitative data.
Hypotheses	H1: AI adoption improves customer satisfaction. H2: AI enhances service quality and operational efficiency. H3: AI drives innovation and repeat visits.
Ethics	Informed consent, confidentiality, and data used only for research purposes.

IV. Discussion

The findings of this study indicate that AI adoption plays a significant role in enhancing business performance in Wayanad's tourism and hospitality sector. Chatbots emerged as the most widely adopted AI tool, allowing businesses to provide quick responses, streamline bookings, and handle tourist inquiries efficiently. Sentiment analytics also proved valuable, enabling businesses to understand visitor preferences and tailor services accordingly, which contributes directly to higher customer satisfaction.

These insights align with global and Indian studies, which suggest that AI technologies are key enablers of innovation, personalization, and efficiency in the tourism sector (Buhalis& Yen, 2020; Ivanov & Webster, 2019; Kumar & Bansal, 2021). For Wayanad, where tourism is a major economic driver, integrating AI provides a practical pathway to meet growing tourist expectations while optimizing resources and business processes.

Overall, AI is not merely a technological tool but a strategic asset that can transform Wayanad's tourism industry, creating a competitive edge, improving visitor experiences, and encouraging sustainable growth.

V. Implications

1. **Improved Customer Experience:** AI tools provide personalized services and faster responses, boosting tourist satisfaction.
2. **Operational Efficiency:** Streamlines processes, reduces manual effort, and optimizes resource use.
3. **Business Innovation:** Enables customized offerings and enhances competitiveness in Wayanad's tourism sector.
4. **Repeat Visits & Revenue:** Higher service quality encourages tourist loyalty and increases revenue.
5. **Data-Driven Decisions:** AI insights help refine strategies and improve service planning.
6. **Regional Growth:** Positions Wayanad as a tech-driven, innovative tourism destination.

V. CONCLUSION

The study highlights that Artificial Intelligence is a key driver of business innovation in Wayanad's tourism and hospitality sector. AI tools such as chatbots, sentiment analytics, and SMART frameworks significantly enhance customer satisfaction, operational efficiency, and the likelihood of repeat visits. While chatbots and sentiment analytics are widely adopted, SMART AI-driven frameworks hold potential for further innovation and strategic growth. Overall, integrating AI enables tourism businesses in Wayanad to deliver personalized services, optimize operations, and strengthen competitiveness, positioning the region as a technology-driven and customer-centric tourism destination.

CORPORATE SOCIAL RESPONSIBILITY AT SBI: STRATEGIES, CHALLENGES AND OUTCOMES

Neethu Vinod
Priyadharshini R
UG Students, Department Of Commerce, PSGR Krishnammal College For Women

Abstract
Corporate Social Responsibility (CSR) has become an important part of the banking industry in India, with SBI (State Bank of India) as a key example. This paper looks at the strategies SBI uses to implement CSR, the challenges it faces, and the results it has achieved. The analysis relies on SBI's CSR spending data, views from stakeholders, and research on CSR practices in the banking industry. It discusses key challenges such as stakeholder awareness, management commitment, and issues with transparency. The paper also highlights SBI's contributions to social welfare and education and suggests ways for future improvements.
The analysis uses SBI's CSR spending data, stakeholder views, and research on CSR practices in the banking sector. It discusses key challenges like stakeholder awareness, management commitment, and transparency issues. The paper also highlights SBI's contributions to social welfare and education and suggests future improvements.
Keywords: Corporate Social Responsibility, State Bank of India, Banking sector, CSR Strategies, Challenges, Outcomes.

INTRODUCTION

Corporate Social Responsibility (CSR) has become a crucial part of how businesses operate today. It shows that companies want to contribute positively to society while working sustainably. For banks, which are essential for economic growth and social development, CSR is especially important. It helps connect their financial activities with the needs of the communities they serve.

The State Bank of India (SBI), the largest public sector bank in India with a wide-reaching presence both domestically and internationally, exemplifies this commitment to responsible banking. Since adopting CSR in 1973 through the "Innovative Banking" initiative, SBI has focused on helping economically and socially disadvantaged groups. Its early efforts included community service activities like blood donation camps, health check-ups, literacy programs, and environmental projects such as tree planting.

Over the years, these efforts developed into a structured CSR approach that combines economic, social, and environmental goals with national priorities. Now, SBI's CSR programs are managed through its Corporate Centre and the SBI Foundation. This section 8 company was created to effectively carry out large-scale and impactful social initiatives.

Despite its accomplishments, SBI faces challenges. These include ensuring transparency in implementation, engaging stakeholders, aligning projects with community needs, and effectively measuring social impact. This paper aims to critically examine SBI's CSR strategies, explore the challenges it faces in fulfilling these responsibilities, and evaluate the social and organizational results of SBI's CSR initiatives.

Objectives

The objectives are:

1. **To examine the idea and importance of Corporate Social Responsibility (CSR) in the banking sector, specifically regarding SBI**: This goal seeks to understand the

basic principles and relevance of CSR in banking. It will show how CSR combines social, economic, and environmental responsibilities for sustainable development.

2. **To analyse the CSR strategies and policies that SBI has adopted**: This means conducting a thorough investigation of SBI's CSR framework. It includes priority areas like health care, education, women's empowerment, environmental sustainability, rural development, and other social welfare activities that support national development goals.
3. **To identify the challenges SBI encounters in designing and carrying out CSR activities**: This includes looking into issues like stakeholder engagement, transparency, monitoring, evaluation methods, and effective use of resources.
4. **To evaluate the outcomes and social impact of SBI's CSR efforts**: This focuses on assessing both the tangible and intangible benefits of SBI's CSR programs. These benefits include the upliftment of marginalized communities, environmental conservation, health improvements, and empowerment. It will also consider the effect on the bank's reputation and business sustainability.

Literature Review

1. Corporate Social Responsibility (CSR) has become very important in India, especially after the Companies Act 2013 made CSR mandatory for certain types of companies, including banks. Many studies and reports have looked into the CSR practices of Indian banks. The State Bank of India (SBI) is often highlighted as a top example because of its strong CSR efforts and financial commitments.
2. Early research points out India's leading role in mandatory CSR, showing the mutual benefits for both business and society. Studies show that banks, particularly public sector ones like SBI, actively participate in CSR activities that focus on education, health care, environmental sustainability, and community development (Naik, 2023). SBI's CSR model combines economic, social, and environmental goals with national priorities. This shows how public sector banks can support inclusive growth.
3. Several case studies emphasize SBI's approach of using its extensive network and operational skills to carry out CSR successfully. The bank's CSR spending often goes beyond the required amounts, highlighting its dedication to social responsibility. In conclusion, the reviewed literature shows that SBI is notable for its significant CSR investments and its broad programs that tackle important social issues.

Research Methodology

This research uses a descriptive and analytical approach to study the Corporate Social Responsibility (CSR) practices at the State Bank of India (SBI). The methodology mainly relies on secondary data sources, including SBI's annual reports, CSR policy documents, sustainability reports, published articles, and government guidelines related to CSR.

The research design is descriptive, aiming to provide a detailed understanding of existing CSR practices without changing any variables. Analytical methods like content analysis categorize CSR initiatives into themes such as education, health, women empowerment, and the environment. Trend analysis examines the pattern of SBI's CSR spending in recent years. Challenges and outcomes are summarized through thematic analysis of reports and academic studies.

CSR Spending Pattern at SBI (2017-2023)- Summary Graph

Year	CSR Expenditure (in	Percentage of Profit (in %)

	crores)	
2017	120	1.0
2018	135	1.1
2019	150	1.2
2020	175	1.15
2021	190	1.2
2022	210	1.3
2023	230	1.35

This table shows the steady rise in SBI's CSR spending. It consistently commits to using about 1% or more of its profit for social responsibility initiatives. This indicates a strategic approach to CSR that meets regulatory requirements

LIMITATIONS: This study relies on secondary data. It depends on the completeness and accuracy of published reports and lacks primary qualitative insights from stakeholders.

CONCLUSION

Corporate Social Responsibility (CSR) at the State Bank of India (SBI) shows a strong and ongoing dedication to social welfare that matches national development goals and regulations.

In conclusion, SBI's CSR journey highlights its understanding of the important role banks have beyond just handling finances. It takes on social responsibilities that help support sustainable national development. With ongoing strategic focus, better governance, and solid monitoring, SBI can improve the effectiveness and reach of its CSR work. This sets a standard for public sector banks to balance business objectives with social commitments.

ARTIFICIAL INTELLIGENCE IN CONSUMER BEHAVIOR AND E-COMMERCE

Ms. V. Varshini, Ms. K. Saishukee
IIIB.Com (Information Technology), KPR College of Arts Science and Research, Coimbatore.

Abstract
Artificial Intelligence (AI) is rapidly transforming the e-commerce sector by influencing consumer behavior and business strategies. Through tools such as recommendation systems, chatbots, predictive analytics, dynamic pricing, and visual search, AI enables companies to understand customer preferences, predict purchase patterns, and provide highly personalized shopping experiences. Leading platforms like Amazon, Flipkart, Nykaa, and BigBasket have integrated AI to improve customer engagement, optimize pricing, detect fraud, and strengthen loyalty.In the Indian context, the adoption of AI in e-commerce has gained momentum due to increasing internet penetration, smartphone usage, and digital payment systems. While AI has enhanced convenience, speed, and trust in online shopping, challenges such as data privacy, ethical transparency, algorithmic bias, and the high cost of adoption remain.This paper examines the impact of AI on consumer decision-making in e-commerce, explores its benefits and limitations, and highlights the unique opportunities for Indian businesses to use AI responsibly. The study also emphasizes the need for ethical and inclusive AI adoption to ensure that consumers in both urban and rural markets can equally benefit from the digital transformation of commerce.
Keywords: Artificial Intelligence, Consumer Behavior, E-Commerce, Personalization, India.

Literature Review:
The relationship between Artificial Intelligence (AI) and consumer behavior in e-commerce has been widely studied in recent years. With rapid digitalization, consumer expectations are shifting towards speed, security, personalization, and trust.ConsumerBehavior in the Digital Era: Consumers expect product suggestions that match their interests and browsing history. A PwC report (2023) reveals that 73% of global consumers consider customer experience as crucial in purchase decisions. Indian shoppers increasingly prefer platforms with safe UPI payments, transparent refund policies, and quick delivery.

Role Of Ai In E-Commerce:
1. Recommendation Systems: Amazon reports nearly 35% of its sales come from AI-powered recommendations. In India, Flipkart and Meesho use AI to provide customized product feeds.
2. Chatbots: Nykaa and Zomato deploy 24/7 AI assistants to resolve queries instantly.
3. Predictive Analytics: BigBasket forecasts grocery demand using AI to prevent stockouts.
4. Dynamic Pricing: MakeMyTrip uses AI for flight and hotel price optimization.
5. Sentiment Analysis: Indian retailers analyze social media reviews to improve trust and brand credibility.

Challenges Of Ai In Commerce:
1. Privacy Concerns: Over 60% of Indian consumers worry about how e-commerce sites handle their data (Deloitte 2023).
2. Algorithmic Bias: Favoritism in recommendations may affect fairness.

3. Cost of Adoption: Small Indian retailers face difficulties integrating AI due to high costs.
4. Ethical Transparency: Many consumers are unaware of how AI decides recommendations or pricing.

Case Study: Flipkart's Ai-Powered Personalization

1. Flipkart, one of India's largest e-commerce platforms, has successfully integrated Artificial Intelligence (AI) into its consumer experience strategy. The company uses AI-driven recommendation engines that analyze browsing history, past purchases, and regional preferences to suggest relevant products.
2. Personalized Feed: Flipkart introduced an "AI-based dynamic homepage" that shows different products for each user based on their interests. For example, a student searching for laptops may see offers on accessories and software, while a homemaker browsing for kitchen items may get cookware suggestions.
3. Voice and Vernacular Search: To reach Tier 2 and Tier 3 city customers, Flipkart launched "Voice Search in multiple Indian languages". This AI feature helped increase engagement from non-English speaking users by 2x.
4. Impact: Reports suggest that AI-driven personalization contributes to nearly 30% of Flipkart's sales, improving customer satisfaction and loyalty.
5. Consumer Behavior Shift: Customers now expect faster, smarter, and more personalized shopping experiences. The success of Flipkart shows how AI not only drives sales but also builds long-term trust among Indian digital consumers.

Research Gap

Existing research has focused mainly on global perspectives, but limited studies explore how AI influences Tier 2 and Tier 3 city consumers in India, where digital adoption is accelerating. This study contributes by examining AI's role in reshaping Indian consumer trust, inclusivity, and affordability in e-commerce.

Objectives Of The Study:

1. To analyze how AI influences consumer purchasing decisions in online platforms.
2. To identify major AI applications (recommendation systems, chatbots, predictive analytics) in Indian e-commerce.
3. To examine the benefits of AI for both consumers and businesses, including personalization, efficiency, and loyalty.
4. To study the challenges and ethical concerns related to AI adoption.
5. To explore the future scope of AI in enhancing digital shopping experiences in India.

Future Scope And Practical Suggestions:

- AI for Small Retailers: Development of low-cost AI tools to help local Kirana stores compete with e-commerce giants.
- Voice Commerce: With rising use of Alexa and Google Assistant in India, voice-based shopping will become mainstream.
- Ethical AI Frameworks: Companies should adopt transparent algorithms to ensure fairness and consumer trust.
- Rural Digital Growth: As India's internet penetration expands, AI can help bring inclusive e-commerce to Tier 2 & Tier 3 cities.
- Sustainability: AI-driven supply chain optimization can reduce carbon footprint and promote green commerce.

CONCLUSION

Artificial Intelligence is significantly reshaping consumer behavior in the digital marketplace. Indian consumers are increasingly driven by personalization, convenience, and trust, all of which are supported by AI technologies. Companies adopting AI tools achieve higher engagement, loyalty, and sales. However, challenges such as privacy, ethical concerns, and unequal adoption rates persist.The future of AI in e-commerce lies in balancing innovation with transparency and inclusivity. By integrating affordable AI solutions for small retailers and focusing on consumer trust, India can build a more ethical, sustainable, and consumer-centric digital marketplace.

EXPORT CREDIT GUARANTEE CORPORATION IN INDIA

Dr. C. Malleshwaran
Head & Associate Professor, Department of Commerce (International Business)
Chikkanna Government Arts College, Tirupur.
P. Govindhamani
Ph.D (Part Time) Research Scholar, Department of Commerce (International Business)
Chikkanna Government Arts College,Tirupur.

Abstract:
In this paper, dive deep into the concept of ECGC, its main objectives, main functions, benefits for exports, documents required, and the process of registration.. Export Credit Guarantee Corporation of India Limited, (ECGC) is a company wholly owned by the Government of India. It functions under the administrative control of the Ministry of Commerce and is managed by a Board of Directors representing Government, Banking, Insurance, Trade and Industry primary objective is to promote country's exports by covering the risk of exports on credit by providing insurance cover to Indian exporters against non-realization of export proceeds due to commercial or political risks; and giving guarantee to banks and other financial institutions to enable them to extend credit facilities to exporters on liberal basis. ECGC is performing well to assist Indian exporters and bankers.
The export business in India is growing, whether it is related to goods or services. The India is a growing consumer hub as well. The contemporary international financial issues, namely US sub-prime lending, appreciation of Indian currency; growing export and flow of FIIs investment in India are changing the equation for exporters, bankers, investors and therefore ECGC. This research study aims at determining how ECGC will be able to fulfill its objective in the current scenario. The research will address studying present level of ECGC performance and to compare with their counterparts, and to evaluate performance on various measurable parameters. What shall be the impact of current trend if it continues on spread sheet and its impact on stakeholders and ECGC? And finally, to suggest what additional measure ECGC should take to perform in adversity. The study envisages critical analysis of various schemes of ECGC vis-à-vis financial performance.
Keywords: Finance, Export, Credit, Guarantee, Ecgc

1.1 INTRODUCTION:

The Export Credit Guarantee Corporation of India (ECGC) is a government-owned and regulated entity established in 1957 under the Ministry of Commerce with the aim of promoting and supporting Indian exports by providing credit risk insurance services, which help mitigate the financial risks associated with international trade. ECGC acts as a safety net for Indian exporters, protecting them from economic or financial uncertainties, such as war, economic instability, or buyer insolvency. Over the years, it has significantly expanded its services, particularly after the economic reforms of the 1990s, which led to increased globalization and trade liberalization. ECGC offers a wide range of insurance products to cater to diverse risk profiles, covering both commercial and political risks.

1.2 Methodology

This study is descriptive in nature and it used the exploratory technique. The data for the study were gathered from the secondary sources such as journals, articles published online and offline on various newspapers and websites.

1.3 Objectives Of The Study

This study is based on the following objectives.

1) To study and focused on e Export Credit Guarantee Corporation of India.
2) To study about the Functions And Services Provided By ECGC
3) To study the ECGC insurance policies.
4) To know about the ECGC registration.

1.4 Export Credit Guarantee Corporation In India:

The Export Credit Guarantee Corporation of India (ECGC) is a government-owned entity that provides credit risk insurance to Indian exporters. It helps mitigate the financial risks associated with non-payment by foreign buyers and political uncertainties. ECGC has the following objectives:

1) To encourage and facilitate exports from India.
2) To protect Indian exporters against the risks of non-payment by foreign buyers.
3) To provide information on the creditworthiness of overseas buyers.
4) To offer insurance coverage to banks providing export finance.
5) To support Indian investments abroad by mitigating political risks.

1.5 Organizational Structure Of Ecgc:

ECGC is governed by a board of directors consisting of representatives from the government, banking, and export sectors. The organization is headed by a chairman and managing director, supported by a team of professionals from finance, insurance, and trade sectors.

1.6 Functions And Services Provided By Ecgc:

1. Credit Risk Insurance For Exporters

The primary service provided by ECGC is credit insurance, which protects exporters against the risk of non-payment by foreign buyers. The corporation offers policies that cover a wide range of risks, including:

a) **Commercial Risks:** This includes the insolvency or bankruptcy of the buyer, failure to pay within the stipulated time frame, or refusal to accept the goods.
b) **Political Risks:** These risks arise due to changes in political conditions, such as government intervention, political instability, war, or civil disturbances in the importing country.

2. Export Credit Insurance Policies

ECGC offers several types of credit insurance policies tailored to the diverse needs of exporters. These include:

a) **Standard Policy:** This is a comprehensive policy that covers both commercial and political risks, typically for exporters who wish to cover their entire export business.
b) **Packaged Policies for Small and Medium Enterprises (SMEs):** Special packages have been created for SMEs to encourage them to explore international markets by offering lower premiums and simplified documentation.
c) **Specific Policies for Project Exports:** ECGC also offers tailored policies for exporters engaged in project-based exports, where the risk may be higher due to the complexity of the projects.
d) **Buyer's Credit Insurance:** This insurance is provided to lenders financing the export of goods and services. The policy protects the lenders against the risk of default by foreign buyers.

3. Post-Shipment and Pre-Shipment Finance

ECGC provides exporters with access to post-shipment and pre-shipment finance:

a) **Pre-shipment Finance Guarantee:** This guarantees a credit facility to exporters before goods are shipped. It ensures that exporters have the necessary working capital to fulfill export orders.
b) **Post-shipment Finance Guarantee:** This ensures that exporters receive payment for their goods even if the foreign buyer delays or defaults on payment after the shipment has been made.

4. Assistance in Recovering Bad Debts

ECGC exporters initiate legal proceedings or engage debt recovery agencies to recover amounts owed to them by foreign buyers.

1.7 Types Of Ecgc Policies

ECGC provides various kinds of policies to exporters, such as:

a) **Comprehensive Risks Policy (CR Policy):**

It covers both political and commercial risks.

b) **Specific Shipment Policy (SS Policy):**

It is tailored for specific shipments.

c) **Export Turnover Policy (ETP):**

This is an annual policy that covers multiple shipments.

d) **Buyerwise Policy (BP):**

It covers risks associated with a particular buyer.

e) **Consignment Exports Policy (CEP):**

It is suitable for export consignments sent on a consignment basis.

f) **Multi-Buyer Exposure Policy (MBEP):**

It covers multiple buyers under one policy.

g) **Export Factoring Policy (EFP):**

It ensures exporters' liquidity through factoring.

1.8 Benefits Of Ecgc For Indian Exporters:

Ecgc Provides Several Benefits To The Indian Exporters, such as:

a) **Financial Security:** ECGC provides financial security to exporters to ensure that they are not exposed to major financial losses due to unpaid invoices or non-receipt of payment.
b) **Competitive Advantage:** Exporters insured by ECGC can offer more favorable credit terms to international buyers, providing a competitive advantage in the global market.
c) **Access to Better Financing**: Exporters with ECGC coverage can secure more favorable financing options from banks and other financial institutions. The reduced risk means that financial institutions are more likely to offer loans and working capital to exporters at favorable terms.
d) **Global Market Expansion:** ECGC enables Indian businesses, tiny and medium-sized enterprises (SMEs), to explore new international markets without incurring the risks associated with foreign trade.

1.9documents Required For Ecgc Registration:

a) IEC Certificate issued by DGFT.
b) RCMC from the relevant Export Promotion Council.
c) GST Registration Certificate.
d) PAN Card of the business entity.
e) Bank Account Details of the business, including a cancelled cheque.
f) Export Performance Data, which provides detailed information on past export transactions.

g) Buyer Details, including information on overseas buyers.
h) Audited balance sheets and profit & loss statements of the business.
i) Copy of Export Orders/Contracts
j) KYC Documents as per RBI guidelines.

2.0 Challenges Faced By Ecgc:

a) Adapting to unpredictable global trade dynamics
b) Assessing the financial stability of foreign buyers
c) Many SMEs lack awareness of ECGC's insurance benefits
d) Change in regulation
e) Economic uncertainty
f) Data Security
g) Operational delays, such as slow settlement claims

CONCLUSION:

An essential component of India's export expansion is the Export Credit Guarantee Corporation of India. ECGC helps exporters reduce their risks by providing a variety of credit risk insurance options, enabling Indian companies to grow and prosper in international marketplaces. To help exporters manage the challenges of international trade, mitigate financial risks, and enhance their competitiveness on the global market, ECGC's services will become increasingly crucial as India emerges as a major player in global commerce. With continued innovation and efforts to raise awareness, ECGC is well-positioned to maintain its pivotal role in India's export industry for many years to come.

PERSUVASIVE ALGORITHM - INFLUENCE OF SOCIAL MEDIA MARKETING IN INDIAN BRANDS

Swathi Anand
Elakkiya. S
Department of Commerce
PSGR Krishnammal College for Women, Coimbatore

Abstract
The paper explores the functioning of the algorithmic persuasion and its effect on influencing the customer perception over 2 most common Indian brands like Swiggy and Sabyasachi through social media marketing. The study aims in understanding the concept of Algorithmic persuasions and analyse the workings of these algorithmic tools used by the social media platforms that shapes the perception of a customer towards a brand. The analysis helps in exploring the future innovations in brand strategies and the social media platforms. The study findings highlight the social media platform that are highly influential in the Indian market and affirms the essential role of the algorithm driven social media marketing in future brand growth and customer engagement.
Keywords: Algorithmic Persuasions, Social Media Marketing, Customer perception, Social Media Platforms, Brand Strategies

INTRODUCTION

Over the last decade, India's social media status has experienced an immense transformation highlighting over 700 million active users spread across prominent social media platforms like Instagram, Whatsapp, YouTube, Twitter, etc… These digital connections are said to be the link between the market and the customers in the case of persuading customers will to purchase.

This is achieved by the social media algorithm tool which is a data driven system that personalize the feed and shape the content which are preferred by the customer either on voluntary or involuntary basis.

Among the various Indian brands, the forefront of these brands are Swiggy, a pioneer in online delivery and Sabyasachi, a luxury fashion brand moved for bridal fashion and wedding ready. The 2 Indian brands are considered to be the top most preference in their sector respectively and they have leveraged social media marketing driven by algorithms and enforce strong customer engagement and aspirational value.

The paper analyses how algorithmic persuasion works on social media among Indian users, with particular focus on Swiggy and Sabyasachi. The preliminary reason for choosing the above tow brands as Swiggy is the most commonly used application for food delivery service and Sabyasachi other hand is the most attractive and limelight fashion brand with luxury touch.

Objectives

1. To understand Algorithmic Persuasion with social media marketing.
2. To analyse the forefront social media platform that has influential value on chosen Indian brands , Swiggy and Sabyasachi.
3. To analyse the future innovations in Brand and platform strategies.

Literature Review

The paper analyses few studies that supports the concept of social media marketing and usage of algorithms.

1. According to the study on "Algorithm Attention and Content creation on Social Media Platforms", Yi Chen (2025). Social media marketing algorithms are highly sophisticated and determined on delivering personalized content. These are processed by analyzing the users engagement signal such as like, shares, comments. To succeed the attention, brands must create persuading unique content to attract customer preference.
2. According to the study on "The influence of Social Media Marketing on Consumer Decision-Making in India",Dr.Rohit Sinha (2023). Social Media Marketing in India is rapidly changing in accordance to the alignment of brand and consumer through platforms like Instagram, Facebook, YouTube. Though these platforms are influential yet expose to challenges like privacy concern and overloading content, certainties in misleading information as well.

Findings:

Algorithm tools that drives influential Social Media Marketing:

In 2025, social media algorithms has stated focusing in highlighting shortest video creation which is of 30 and more seconds. The trend based quick content gathers the attention of the customers to know deeper about the product or service, followed by influencer marketing and collaborations. Some of the successful algorithm tools are,

- SEO and Metadata Tagging
- Content ranking systems
- A/B Testing & Performance systems

Customer perception and Platform Preference:

Customers do expect highly personalized interactions and content. According to sources and articles the comparison between several social media platforms like Instagram and Facebook focuses on inducing purchasing decisions through creative content and YouTube is considered as the booming platform for educational content and product demonstrations and Whatsapp despite being highest population of usage remains as the personal space for exchanging preferences and opinions.

Thus YouTube with 33% of usage is widely used to attract diverse nature of customers with high brand influence and followed by Instagram with 28% of usage with high dominance of current trends. These platforms are considered to be highly influential Social Media Marketing platforms that ensures optimized Algorithmic Persuasion.

Brand and Platform strategic metrics of Swiggy and Sabyasachi:

a) **Swiggy**

Table 1 - Swiggy Brand Value and Social Media growth (2020-2025)

Year	**Instagram Followers**	**Algorithm Tool**	**Rvenue/Result**
2020	150K+	Targeted social ads and personalized feeds	Market expansion - 245 cities
2021	250K+	Influencer marketing and recommendation engines	Expanded app installs
2022	339K+	AI personalization	Increased content attention
2023	600K+	Voice of Hunger tags - increased media reach	3000+crore revenue
2024	800K+	Real time sentiment analysis	9M+ of monthly transacting users

2025	851K+	Video first content strategy , Deep AI analytics	Revenue over 4960 crore with 54% of market leader

Source: Swiggy-Annual-Report-FY-2024-2025

b) Sabyasachi

Table 2 - Sabyasachi Brand Value and Social Media growth (2020-2025)

Year	Instagram Followers (Millions)	Algorithm Tool	Revenue/Result
2020	1.8	Influencer collaboration, Social listening tools	Growing regional and aspirational reach
2021	2.9	Content targeting	Online presence and customer reach
2022	3.8	Influencer curation with reels, posts	Higher web traffic
2023	5	AR/VR content generation	Increase in websites visit up to 6%
2024	6	User genearated content	Increased brand loyalty and customer preference
2025	6.4	Deep learning models	High brand equity among top fashion brands

Source: sabyasachi.com - Website Analytics for 2025

Future Innovations in Brand and Platform Strategies:

Both the brands Swiggy and Sabyasachi are exploring AI powered chat-bots for instant customer service and follow ups which are used for predictive analysis and future personalized service rendition. Integration of AR/VR tools to enhance customer experience.

Social media platforms on other side evolves with a tremendous shift from conventional methods and are integrating with native shopping, arrangement of live events and local language personalization for convenient usage. This paves a way for expanding the aspects of algorithmic persuasion.

CONCLUSION

To conclude, the study highlights the transformative role of algorithmic persuasion in social media marketing especially on light of 2 different and prominent Indian brands that are successful in respective sectors, Swiggy and Sabyasachi. The research objectives were met by analyzing and understanding the working and influence of the algorithmic tools towards the marketing value of the brands. The study highlights that Instagram and YouTube is considered to be the highly influential social media platform with higher impact on these brands. The future potential aspect of integrity and inclusivity if AI and ML and AR/VR chat-bots with the sentimental touch of customers results in building stronger brand value and customer reach. This implies that mastering the appropriate usage of Algorithmic tools is essential for brands in gathering customer attention and sustain competitive advantage in future business functioning.

A COMPARATIVE ANALYSIS OF TRADITIONAL AND AI-DRIVEN INVESTMENT DECISION-MAKING

Dr. G. Rekha
Assistant Professor & Head, Department of B Com (A&F & BA),
PSGR Krishnammal College for Women, Coimbatore
Ms. P.S. Reshma
Ph.D. Research Scholar, Department of Commerce,
PSGR Krishnammal college for Women, Coimbatore

Abstract
This paper explores the transition of investment techniques from traditional to AI-driven approacheswith a focus on the role of Machine Learning (ML), and Deep Learning (DL). While AI-driven techniques integrate structured and unstructured data for dynamic, real-time decision-making, traditional approaches such as CAPM and MPT highly rely on historical data and static assumptions. Techniques like Random Forests, LSTMs, CNNs, and Transformers enhance sentiment analysis, stock forecasting, and portfolio optimization, significantly surpassing traditional techniques. The study also emphasizes the significance of Explainable AI (XAI) in addressing the "black box" problem. Results suggests that AI allows adaptive, and personalized investment strategies, with strong implications for India's fintech ecosystem and global markets.
Keywords:Artificial Intelligence (AI), Machine Learning (ML), Deep Learning (DL), traditional Investment techniques, AI-driven Investment techniques.

INTRODUCTION

Investment involves devoting money or assets into various instruments, such as bonds, mutual funds, stocks or real estate, with the supposition of earning returns or wealth over time. They act as a key factor in achieving financial goals, reducing risks, and establishing long-term financial security. Owing to the technological advances, the investment planning, execution and optimisation is reshaped in today's data-driven era. The AI has originated as a transformational force in the area of investment management (Investopedia, 2025). AI in investment helps to analyse large datasets in fast pace with minimal human intervention by obtaining information that assists in investment strategies and decisions. AI can develop models that helps to forecast the future market movements by analysingthe patters and identifying the trends in the stock market, by employing Machine Learning (ML), Natural Language Processing (NLP) and other advanced techniques (Fincart,2024).

Even though the classic investment models like CAPM and MPT have been employed for a long time, their efficacy in today's dynamic and data-rich financial markets is restricted by their resilience on historical data, static assumptions and limited adaptability. Both opportunities and challenges are presented by the rapid rise of AL, ML, and DL, specifically in relation to interpretability, transparency, and incorporation into traditional investing methods. By analysing how AI-driven techniques enhance forecasting, portfolio optimization, and risk management in comparison to traditional techniques, this paper aims to analyse the limitations of conventional investment approaches, and investigate how AI,ML and DL might address these gaps, and to propose a conceptual framework that encapsulates the transition from traditional to AI-driven investment techniques.

Literature review

Traditional Investment strategies

1. Modern Portfolio Theory (MPT), introduced by Harry Markowitz in the Journal of finance(1952), is one of the traditional techniques of investment strategies (Francis, J. C., & Kim, D. 2013). This theory proposed the Mean-Variance (MV) model, whichadvised investors to diversify their investments amongvarious avenues, which mitigates risk of investing all in one place and aids in balancing risk and return.
2. Eventually, models like CAPM, the Fama-French Three-Factor, and Carhart Four-Factor emerged as an extension of Modern Portfolio Theory. Where Capital Asset Pricing Model (CAPM) developed by Sharpe, Lintner, Mossin, and Black,linked expected returnsusing only one variable risk (beta), assuming that markets are at equilibrium. It assists in project valuation and making investment decisions, provided that model's assumptions are met (Krištofík, P. 2010). While, Fama and French observed that beta alone is not sufficient to measure the differences in stock returns and price volatility in the U.S. market, they introduced the Fama-French Three-Factor model that includes market capitalization, book-to-market ratio, and price-to-earnings ratio (Tao, W. 2022).Another model is Mark Carhart's Four-Factor which has an additional factor to Fama French Three-Factor modelthat is momentum factor which explains the velocity of change in stock price (Wikipedia).
3. In traditional investment methodologies, fundamental analysis employs instruments like balance sheets, cash flow statements, income statements, and measurements like the ROE, debt-equity-ratio, EPS, and P/E ratio to assess a company's financial health.Technical analysis focuses on price patterns and market trends using instruments such as moving averages, Bollinger Bands, RSI, MACD, and candlestick charts. These techniques highly rely on investor judgement and historical data for decision making.
4. Despite their widespread adoption, these techniques have several drawbacks. Their heavy reliance on historical data, make it difficult to adapt to the rapidly evolving market conditions. Traditional models also find it difficult to handle large, complicated and real time datasets, which are growing more important in modern markets (CFI,2024). Furthermore, decision-making in traditional techniques often include human intervention, resulting in inconsistency and bias, and when compared to AI-driven methods sudden market shifts in traditional techniques are generally slower and less adaptable. Further, behavioural biases such as herding, confirmation bias, and overconfidence are introduced by human discretion and may influence judgement and impede decision-making (Mezzi, 2025)

Introduction to AI, ML and DL in investments

Over the past years, financial markets have become volatile, faster and highly data-driven, making traditional techniques difficult to keep pace.As a result,Artificial Intelligence (AI) and Machine Learning (ML) has emerged as transformational technologies.These techniques anticipated a new age in finance (Quinfer,2018).Initial applications of AI in finance such as credit scoring, rule based expert systems for trading, and risk management, dates back to the late 20th century. However, the rigid and unyielding design of rule-based systems limited their efficacy. Also, they were not designed to learn from new data or adjust to changing circumstances (Quinfer,2018). AI's growing significance in modern portfolio management has been made clear by the observation that over 90% of investment managers are already using or planning to use AI to improve decision-making (Mercer, 2024). In an attempt to overcome these shortcomings, Machine Learning (ML) emerged as a prominent innovation. Unlike rule-based expert systems, ML algorithms learn from historical and present data to expose hidden patterns, forecasting, and facilitate adaptive decision making (Athey, S. 2018).However, the ML's growing complexity and improved prediction accuracy

in investment decisions, which raised concerns regarding transparency and interpretability, introduced the "black box problem" (Rudin, C. 2019).

Deep Learning (DL) a subset of ML, that employs Artificial Neural Networks (ANNs) to process high-dimensional, large-scale, and non-linear datasets (LeCun, Y., et,al., 2015). DL's potential to model sequential dependencies has a significant influence in time-series stock price forecasting utilizing Long Short-TermMemory (LSTM) networks, which surpass traditional models in accuracy and robustness. Furthermore, sentiment analysis of analyst reports, financial news, and social media, has been facilitated by DL techniques like Convolutional Neural Networks (CNNs) and transformers,offering predictive insights on market psychology to investors.

1. Comparative analysis

A comparison of Traditional with AI-driven investment techniques emphasizes how the evolving techniques address the drawbacks of traditional techniques. Traditional investment techniques such as mean-variance optimization (Markowitz, 1952), CAPM (Sharpe, 1964), and rule-based expert systems, rely heavily on historical data and a few financial ratios, which makes them transparent but restricted when markets evolve or when the data is highly-dimensional and corrupt. These traditional techniques assume stable correlations and often overlook real-time signals from social media, news, or alternative data, leaving portfolios vulnerable to model misspecification and slow response to regime shifts. These limitations and the need to adapt advanced techniquesand to are highlighted in surveys and reviews (Warin, T., & Stojkov, A.,Coqueret, G. 2021).The AI-driven investment techniques overcome their inability of adapting to volatile markets or incorporate heavy data by employing massive, real-time datasets for effective decision-making. When compared to ARIMA models, linear regression, Random Forests, SVM, and ensemble ML techniquesenhance stock return forecasting and risk assessment.

AI further makes it possible to implement personalized investment plans, which traditional one-size-fits-all techniques failed to achieve. Portfolio personalisation through increased financial inclusion has been done by robo-advisors such as betterment and India's Groww by employing ML algorithms. Furthermore, sentiment analysis utilizing CNNs and transformers incorporates analyst reports, financial news, and social media to predict investor behaviour.

Thereby, the comparative results from previous studies illustrates that AI, ML and DL, along with enhancing prediction accuracy, also adds agility, personalization, and broader data integration to address the main drawbacks of traditional techniques.

2. Applications

In India, robo-advisors such as Paytm Money, Zerodha's Niyo, and Groww are broadening accessibility to wealth management services by employing ML to allocate portfolios and provide customised investment advices to retail investors. Indian banks and NBFCs use ML algorithms for fraud detection and credit risk assessment, enhancing financial inclusion while reducing systemic risk. Simultaneously, algorithmic trading platforms in BSE and NSE employs ML and DL models such as LSTM and reinforcement learning for trade execution and intraday predictions, boosting liquidity and efficiency. Globally, companies like Wealthfront, BlackRock's Aladdin, and Betterment integrate ML and DL to automate rebalancing, portfolio construction, and mitigate risks in real time.In an effort to capture alpha, hedge funds highly rely on DL for sentiment analysis of social media, alternative datasets, and financial news. As a whole, these applications exhibits that AI, ML, and DL have progressed from research into widespread adoption, transforming both institutional and retail investment landscapes.

3. Implications and Conclusion

The key implications embrace establishing ethical AI standards, investor protection frameworks, and regulatory sandboxes, confirming innovation aligns with financial stability. AI – driven investment techniques are not just theoretical; they are already evolving practice across India and around the world. The comparative analysis of traditional and AI-driven investment techniques emphasizes an obvious transition from rule-based expert systems and historical models to data-rich, adaptive, and personalized systems. Even though traditional techniques provided transparency, they lacked responsiveness and scalability in the rapidly evolving financial markets of today.Real-time risk monitoring, sentiment-driven forecasting, and highly-personalised investment strategies are now enabled by ML, AL, and DL, bridging many gaps left by earlier approaches. Overall, AI-driven investment techniques and strategies are an advancement over traditional approaches, accompanying them with increased speed, precision, and adaptability. A future where investment decisions are context-aware and data-driven, establishing a balance between efficiency and transparency, has been hinted by the convergence of AI advancements with traditional finance theory.

FROM DATA TO DELIGHT: THE ROLE OF AI IN CREATING HYPER-PERSONALIZED CUSTOMER JOURNEYS

Rithanya Manikandan, **Ashwin M.P**
B.Com integrated with CMA, Presidency University

Abstract

The emergence of Artificial Intelligence (AI) has transformed personalization into hyper-personalization, enabling businesses to move beyond generic customer interactions towards real-time, context-aware experiences. This paper explores the role of AI in designing hyper-personalized customer journeys that not only meet but consistently exceed consumer expectations. The **aim** of the study is to analyze how AI technologies—including machine learning, natural language processing, and predictive analytics—can be harnessed to enhance customer engagement, satisfaction, and loyalty. The research further examines the **gap** in current literature, which often emphasizes basic personalization while overlooking the strategic and ethical implications of hyper-personalization.

The **methodology** adopted is qualitative, relying on secondary sources such as peer-reviewed journals, industry reports, and case studies from leading firms including Amazon, Netflix, and Spotify. Through comparative analysis, the study identifies best practices, benefits, and challenges in implementing AI-driven personalization strategies.

The **results and discussion** highlight that businesses employing hyper-personalization witness measurable improvements in retention, customer lifetime value, and brand differentiation, though issues of data privacy and algorithmic bias remain pressing concerns.

The **conclusion** suggests that responsible and transparent AI adoption can transform customer journeys from being merely data-driven to truly delightful, offering sustainable competitive advantage

INTRODUCTION

In today's digital economy, customer expectations have evolved beyond basic personalization such as name-based emails or generic product suggestions. Customers now demand seamless, context-aware, and emotionally intelligent experiences tailored to their unique needs and behaviors (Wedel & Kannan, 2016). This shift has driven the rise of hyper-personalization, powered largely by Artificial Intelligence (AI). Unlike traditional personalization that depends on demographic data, hyper-personalization uses real-time behavioral, transactional, and contextual data to create dynamic customer journeys (Kumar et al., 2016).

Industries such as e-commerce, healthcare, financial services, and entertainment highlight the significance of this trend. Netflix, for instance, attributes more than 80% of its viewing activity to AI-driven recommendations, while Amazon leverages AI to enhance product suggestions, boosting conversions and loyalty (Gomez-Uribe & Hunt, 2016; Huang & Rust, 2021). For businesses, hyper-personalization acts as a strategic differentiator, improving customer satisfaction, retention, and lifetime value (Lemon & Verhoef, 2016). Gartner (2022) projects that by 2026, over 70% of enterprises will adopt AI-driven personalization platforms, emphasizing its growing role in customer experience management.

However, challenges remain. Data privacy, algorithmic bias, and over-reliance on AI raise concerns regarding trust and fairness (Mikalef et al., 2020). Filter bubbles may further restrict consumer choice and discovery (Pariser, 2011). Thus, organizations must balance innovation with ethical AI practices.

This study explores how AI enables hyper-personalized customer journeys, its impact on relationships, and strategies to ensure transparency and long-term value. It aims to bridge

academic and managerial perspectives, highlighting AI as both a tool for efficiency and a driver of experience-driven differentiation.

Literarture Review

Hyper-personalized customer experience has emerged as a key differentiator in e-commerce, driven by rapid advancements in data analytics, artificial intelligence (AI), and machine learning. Unlike traditional personalization, hyper-personalization goes beyond demographic segmentation to leverage real-time behavioral, transactional, and psychographic data, enabling companies to deliver highly relevant and individualized experiences.

Several studies highlight that consumers increasingly expect tailored interactions, with research by McKinsey (2021) showing that over 70% of online shoppers prefer brands that personalize their engagement. AI-driven recommendation systems, predictive analytics, and natural language processing play a critical role in enabling this, with platforms like Amazon and Netflix setting benchmarks in personalized shopping journeys.

Academic literature also stresses the impact of hyper-personalization on customer loyalty and retention. Kumar & Reinartz (2019) emphasize that targeted experiences improve conversion rates, while Lemon & Verhoef (2016) argue that personalized touchpoints across the customer journey enhance satisfaction and trust. However, scholars also warn of challenges such as data privacy concerns, algorithmic bias, and consumer resistance to "over-targeting," which can lead to feelings of intrusion.

Recent studies suggest that while hyper-personalization improves short-term sales, long-term success depends on striking a balance between personalization and transparency. This is especially relevant in the post-GDPR era, where ethical data usage is as critical as technological innovation.

In summary, the literature shows that hyper-personalized experiences in e-commerce significantly shape consumer behavior and business performance, but sustainable implementation requires addressing privacy, ethics, and trust.

Research problem

In today's highly competitive retail environment, personalization has become a critical driver of customer loyalty and engagement. While retailers often use segmentation-based personalization, such approaches fail to deliver truly individualized experiences. Research shows that **hyper-personalization**, powered by AI, machine learning, and real-time analytics, can significantly enhance customer satisfaction, conversion rates, and brand loyalty. However, there is a notable gap in understanding how retailers can systematically adopt such strategies while addressing issues of **data privacy, technological integration, and ethics**.

The **aim of this study** is to examine the transformative role of hyper-personalization in retail and propose frameworks that balance customer satisfaction, business growth, and responsible data use.

The **objectives** are to:

1. Assess its impact on customer satisfaction and loyalty.
2. Explore enabling technologies.
3. Examine ethical and privacy challenges.
4. Propose a sustainable implementation framework.

Proposed solutions include AI-driven recommendations, privacy-preserving technologies, omnichannel integration, and ethical consent-driven guidelines.

Methodology

This research is based entirely on **secondary data collection**. Relevant information has been gathered from academic journals, research articles, books, industry whitepapers, and credible online reports focusing on hyper-personalized customer experience. The collected data is systematically reviewed and compared to identify patterns, trends, and best practices across different industries. Content analysis is used to evaluate insights on how personalization impacts customer satisfaction, loyalty, and business growth. Relying solely on secondary data ensures a broad and reliable understanding of the topic while saving time and resources, making the study efficient and research-driven.

Analyses

The analysis of hyper-personalized customer experience highlights its transformative role in reshaping customer-brand interactions. By leveraging secondary data from journals and reports, it becomes evident that AI, big data, and machine learning are the primary enablers of personalization at scale. Companies that integrate real-time analytics and customer behavior tracking witness higher engagement, stronger brand loyalty, and improved conversion rates. However, the analysis also reveals a critical gap—while customers appreciate personalization, they are equally concerned about privacy and data misuse. This dual perception emphasizes the need for balance between value creation and ethical data usage. Furthermore, sector-specific studies indicate that personalization strategies in e-commerce and banking yield higher returns compared to traditional retail, proving its contextual importance. Overall, hyper-personalization emerges not only as a competitive differentiator but also as a strategic necessity for businesses aiming to thrive in the digital-first economy.

Results and Discussions

The findings from secondary data indicate that hyper-personalization significantly enhances customer engagement, loyalty, and satisfaction. Studies highlight that companies using advanced analytics, AI, and customer data see improved conversion rates and long-term retention. Personalized recommendations and targeted communication create stronger emotional connections with customers. However, the research also reveals challenges such as data privacy concerns, high implementation costs, and dependency on accurate data collection. Businesses adopting hyper-personalization report a competitive advantage, but success depends on balancing personalization with ethical data practices. Overall, the results suggest that hyper-personalization is a powerful but complex customer experience strategy.

CONCLUSION AND FUTURE SCOPE

In conclusion, hyper-personalized customer experience has emerged as a transformative approach in modern business, enabling firms to engage customers at a deeper level. By integrating artificial intelligence, machine learning, and big data analytics, organizations are able to create unique, context-driven experiences that significantly enhance satisfaction, loyalty, and brand value. Secondary data clearly indicates that hyper-personalization not only improves conversion rates but also fosters long-term customer relationships. At the same time, businesses must remain cautious of ethical and regulatory issues, particularly regarding data privacy, transparency, and customer trust. Therefore, success lies in striking a balance between personalization and responsible data usage.

Looking ahead, the future scope of hyper-personalization is vast. As technology advances, predictive analytics, generative AI, and real-time data processing will allow businesses to design experiences that are even more intuitive and seamless. With the rise of omnichannel platforms, firms can deliver consistent personalization across digital, physical, and hybrid touchpoints. Moreover, innovations in augmented reality, voice-based assistants, and blockchain for secure data sharing will further redefine customer engagement. Future

research may focus on developing frameworks to ensure ethical personalization, reduce bias in algorithms, and strengthen consumer trust. Thus, hyper-personalization is set to evolve as a critical differentiator in competitive markets.

IMPACT OF SOCIAL MEDIA INFLUENCER MARKETING ON CONSUMER BUYING BEHAVIOUR AND BRAND AWARENESS IN TIRUPUR CITY

Dr. U. Gomathi
Associate Professor, PG & Research Department of Commerce
Tiruppur Kumaran College for Women, Tirupur.
Ms. P. Geethamani
Ph.D Research scholar, PG & Research Department of Commerce
Tiruppur Kumaran College for Women, Tirupur.

Abstract
Social media influencer marketing has emerged as a dominant strategy in the digital marketing landscape, leveraging the popularity and credibility of online influencers to promote brands, products, and services. This approach capitalizes on the trust that influences have built with their audience's across platforms such as Instagram, Facebook, Tiktok, YouTube, Linked, and Twitter resulting in more authentic and engaging brand communication. This fusion of marketing strategy and digital influence enables to build trust, increase engagement, and drive conversions in more cost-effective ways compared to traditional advertising. This study explores the core principles, strategies, and tools of social media marketing, analyzing its effectiveness in influencing consumer buying behaviour and brand awareness. It also addresses key challenges such as content saturation, algorithmic limitation, and the need for authenticity in digital communication. As consumer expectations evolve, mastering social media marketing is essential for businesses aiming to maintain relevance and spirited advantage in an increasingly digital marketplace.
Keywords: *Social media influencer, Brand communication, Digital influence, Effectiveness, Businesses*.

1.1 INTRODUCTION

Social media marketing is a branch of digital marketing that focuses on using social media platforms to connect with audiences. Build brand awareness, promote product or services, and drive business growth. It involves creating and sharing tailored content on platforms like Facebook, Instagram, Youtube, TikTok, Twitter, and LinkedIn to engage users and encourage interaction. Today's digital period, social media has become an essential part of everyday life, with billions of people using these platforms to communicate, share information, and make purchasing decision. Businesses leverage this widespread usage to reach potential customers more effectively and in a more personal and interactive way than traditional advertising allows. Social media marketing goes beyond just posting content- it includes activities such as paid advertising, influencer collaborations, community engagement, analytics tracking, and customer services. While executed strategically, it helps brands grow their online presence, improve customer relationships, and influence consumer behaviour. As technology and user behaviour continue to evolve, social media marketing remains a dynamic and powerful tool for businesses looking to thrive in a highly competitive digital landscape. Social media influencer marketing is a powerful strategy brand collaborate with individuals have a strong presence and credibility on most commonly used platforms like Instagram, YouTube, TikTok, Twitter, Facebook, Pinterest, Snapchat, Linked, Whatsapp. These influencers promote products or services to their followers, often leading to change in consumer perceptions, preferences, and buying decisions. Social media influencer marketing plays a big role in increasing brand awareness. The influencers share a brand or product with their followers, it helps more people see, recognize, and remember that brand. Since

influencers often have loyal followers trust their opinions, and recommendations feel more genuine than regular advertisement.

This can introduce a brand to new audiences, improve its reputation, and make people more likely to notice and talk about it. Over time, seeing a brand in an influencer's content again and again helps it stay in people's minds, which is to building strong brand awareness.

1.3 RESEARCH METHODOLOGY

Research methodology is the way to systematically solve the research problems. Through data gathering using various techniques to provide an understanding of gathered data and drawing conclusions about the investigate data. It has two types (i.e) qualitative & quantitative research methods. The data are analysed by using both the above methods. The aim of this study was "Impact of social media influencer marketing on consumer buying behaviour and brand awareness" in Tiruppur city. In this study mixed methods approach was used, with questionnaires and interviews conducted with 50 respondents. According to the findings of the study, respondent in Tiruppur city had generally positive and negative impact on social media influencer marketing and consumer buying behaviour. The analysis of the data was conducted using: Simple percentage analysis, Rank analysis, Descriptive analysis.

1.4 ANALYSIS AND INTERPRETATION

TABLE 1: Demographic details of the respondent

S.NO	DEMOGRAPHIC PROFILE	PARTICULARS	PERCENTAGE ANALYSIS
1	Gender	Male	40
		Female	60
2	Age	Below 20 years	20
		20 years- 30 years	20
		Above 30 years	60
3	Educational qualification	School level	20
		Diploma	10
		Under Graduate	40
		Post Graduate	10
		Professional	20
4	Occupation	Student	30
		Employee	20
		Business	20
		Job seeker	10
		House wife	20
5	Monthly Income	Below Rs.40,000	40
		Rs. 40,001- Rs. 50,000	30
		Rs. 50,001- Rs.60,000	20
		Above Rs.60,001	10
Total			**100**

Source: Primary data: As per shown in the table demographics of respondents were classified according to their gender, age, educational qualification, occupation, monthly Income level. Majority (60%) of the respondents are female. and Most (60%) of the respondents are under the age group is above 30 years. Most (40%) of the respondents educational qualification comes under the field of under graduate, and (30%) of the respondents are students, and (40%) of the respondents are family monthly income is below Rs.40, 000.

1.5 RANK ANALYSIS: **TABLE 2: Ranking the observation**

RANK / FACTORS	I	II	III	IV	V	TOTAL SCORE	MEAN SCORE	RANK
Product reviews by influencer	50	20	45	30	5	150	3.0	II
Discount codes	50	60	30	10	10	160	3.20	I
Influencer lifestyle	50	40	45	20	5	160	3.20	I
Attractive image	50	20	15	30	15	130	2.60	III
Product usability/demo	50	60	15	10	15	150	3.0	II

The above table reveals that highest mean value (3.20) for the "Discount codes" and "Influencer lifestyle" ranked as first. Second rank was assigned to the "Product reviews by influencer" and "Product usability/demo" with the mean value of (3.0). "Attractive image" assigned as third rank with the mean value of (2.60).

1.6 DESCRIPTIVE STATISTICS

TABLE 3: Positive impacts of social media influencer marketing agreeability-Descriptive statistics

S. NO	POSITIVE IMPACT	SA	A	N	DA	SDA	TOTAL POINT	MEAN VALUE	INDIC ATORS
1	Create awareness	25	60	60	10	5	160	3.20	Neutral
2	Improve confidence level	25	100	30	10	5	170	3.40	Neutral
3	Increasing knowledge	50	40	45	20	5	160	3.20	Neutral
4	Share ideas	75	80	15	10	5	185	3.70	Agree

5	Convenient communication	75	80	15	10	5	185	3.70	Agree
6	Business growth	75	60	30	10	5	180	3.60	Agree

The above table predicts that all the above positive impact of influencer marketing (i.e) "Share ideas" "Convenient communication" "Business growth" agreeable positive impact with the mean value of 3.70 and 3.60. "Create awareness" "Improve confidence level" "Increasing knowledge" is neutral positive impact with the mean value of 3.20 and 3.40.

TABLE 4: Negative impacts of social media influencer marketing agreeability-Descriptive analysis

S. NO	NEGATIVE IMPACT	SA	A	N	DA	SDA	TOTAL POINT	MEAN VALUE	INDIC ATORS
1	Cyber bullying	100	60	15	10	5	190	3.80	Agree
2	Addiction and distraction	75	80	15	10	5	185	3.70	Agree
3	Social isolation	50	60	30	20	5	165	3.30	Neutral
4	Misinformation/ fake news	75	60	30	10	5	180	3.60	Agree
5	Mental health issues	125	40	15	10	5	195	3.90	Agree
6	Lack of privacy and security	50	60	30	20	5	165	3.30	Neutral

The above table predicts that all the above negative impact of influencer marketing (i.e) "Cyber bullying" "Addiction and distraction" "Misinformation/fake news" "Mental health issues" agreeable negative impact with the mean value of 3.80, 3.70, 3.60, and 3.90. "Social isolation" "Lack of privacy and security" is neutral negative impact with the mean value 3.30.

1.7 Findings Of The Study

- Majority 60% of the respondents are female.
- Most 60% of the respondents are in the age group of above 30 years.
- Out of 50 respondents, 40% of the respondents are under graduate.
- It was found that 30% of the respondents student in the occupation status.
- Maximum 40% of the respondents earning monthly income below Rs. 40,000.

Rank analysis: The Factors "Discount codes" and "Influencer lifestyle" ranked as first. These are indicates the social media influencer marketing on consumer buying decision.

Descriptive Analysis: 1. Agreeability level on the following positive impact of social media influencer marketing: (i.e) “Share ideas” “Convenient communication” “Business growth” agreeable positive impact. “Create awareness” “Improve confidence level” “Increasing knowledge” is neutral positive impact.
2. Agreeability level on the following negative impact of social media influencer marketing: (i.e) predicts that all the above negative impact of influencer marketing (i.e) “Cyber bullying” “Addiction and distraction” “Misinformation/fake news” “Mental health issues” agreeable negative impact. “Social isolation” “Lack of privacy and security” is neutral negative impact.

1.8 Suggestions

*Influencers should share only the real experiences about products, not just paid promotions, so consumers can make better decisions. *Different influencers saying different things about the product can confuse customers. *Educate users on online safety practices & digital communication.*Promote real- life interactions & reduce passive scrolling through engaging, community driven features. *Users can spend limited time on social media platforms.

1.9 Conclusion

Social media influencer marketing has changed the way brands interact with consumers. Instead of using traditional ads, companies now work with influencers built trust with their followers. These influencers help promote products in a more personal and believable way, which can lead to increased interest in a brand and influence people’s buying decisions. Social media platforms make it easy for users to give feedback, share opinions, and become part of a brand’s online community. This helps create stronger connections between consumers and brands. However, influencer marketing also has some challenges, such as fake followers, too many sponsored posts, and the need to clearly show content is paid for. Still, done well, influencer marketing can be a powerful tool to raise brand awareness and encourage people to make purchases. As the digital world continues to grow, influencers will likely play an even bigger role in brands reach and influence their audiences.

AI FOR BUSINESS INNOVATION

Dr. S. Uma
Associate Professor and Head Department of Commerce
Kongunadu Arts and Science College (Autonomous)
Ms. S. Subalakshana
Department of Commerce, Kongunadu Arts and Science College (Autonomous)

Abstract
The revolutionary way that generative AI disrupts business models today is by delivering radical shifts in important things like value delivery, business operations, and competitiveness. It allows businesses to perform difficult tasks, orchestrate customized client interactions, and foster change throughout sectors. With endless possibilities, generative AI's risks upon implementation are as follows: Data protection, Ethical and legal spheres, and Talent demand. While artificial intelligence (AI) requires business model innovation, it simultaneously poses persistent operational, regulatory and strategic challenges, highlighting the importance of researching AI adaptation to appropriate organizational value. AI adaptation is not monolithic, and its nature and consequent value appropriation processes may vary due to external factors and an organization's strategic approach to innovation and resource management
Key Words:Artificial Intelligence, Technology, Virtual, Customer, Innovation

INTRODUCTION:

Artificial Intelligence (AI) is rapidly emerging as a key driver of business innovation, enabling companies to transform how they operate, compete, and create value. It is opening doors to entirely new business models and revenue streams. Companies are using AI to design smarter products, predict market trends, and tailor offerings to individual customer needs. In industries ranging from healthcare to retail and manufacturing, AI-driven innovation is helping businesses stay agile, competitive, and future-ready. As digital transformation accelerates, integrating AI into core business strategies is becoming essential for sustained growth and long-term success. “If you look around the world today, we believe that we’re on the precipice of a major transformation,” Stave says. “We go so far as to say it's going to be bigger than the internet, bigger than electricity.”

Artificial Intelligence (Ai) In Business

Artificial intelligence in business is the use of AI tools such as machine learning, natural language processing, and computer vision to optimize business functions, boost employee productivity, and drive business value. According to McKinsey & Company, the use of artificial intelligence in business operations has doubled since 2017. This is largely because AI technology can be customized to meet an organization’s unique needs. 63% of McKinsey’s respondents expect their investment in AI technologies to increase over the next three years. To use AI in an effective business strategy, an organization must have a clear understanding of its business functions, how AI works and what aspects of the business can be improved through AI implementation. While the use of AI tools to automate repetitive tasks and increase employee productivity remains popular, businesses are also moving beyond these use cases and using AI to assist in higher-level, strategic initiatives that help drive broader business value.

Ai For Business Innovation

Business innovation involves changes in how a business generates and delivers value and captures value from the offer. While on product or service innovation, one tries to make incremental improvements to or develop new products, services, etc , business innovation demands fundamental changes to the mechanics of the business. This can concern shifts in strategies for interacting with the customers, revenue models, business procedures, or the value a firm or service provides. Today, business model innovation is vital for any establishment that wants to maintain its competitive advantage because the rise of digital technology and interconnectivity changes customer demands and brings new entrants to the market.

AI Innovation Across Sectors:

Finance:

AI is spurring a new era of innovation in finance. According to McKinsey, banks that effectively integrate AI into their operations could automate up to 70 percent of their business activities enhancing efficiency and service delivery.Ant Group is a prime example of an innovative, AI-driven business. Its digital banking service, MY Bank, uses advanced machine-learning algorithms to process loan applications quickly without human intervention for businesses that traditionally struggle to access credit, including over 53 million small and medium-sized enterprises in China.

Manufacturing:

Implementing AI into your business can result in smarter, faster, more adaptable manufacturing. According to a Cap gemini Research Institute report, 51 percent of the top European manufacturers have implemented at least one AI use case. To foster AI innovation, consider using predictive maintenance to analyze manufacturing data with algorithms and anticipate equipment failures before they happen. In doing so, you can optimize maintenance schedules, reduce costly downtime, and create an environment that encourages creative problem-solving. For example, multinational technology conglomerate Siemens uses AI-powered predictive maintenance to monitor industrial equipment in real time and identify failures early enabling it to maintain a flexible production environment that supports: AI-enhanced energy optimization, Advanced robotics integration .

TRANSPORTATION AND LOGISTICS:

AI can benefit transportation and logistics by helping meet the growing demand for faster, more reliable deliveries. According to McKinsey, businesses that quickly adopt AI-driven supply chain management can improve their logistics costs by 15 percent, inventory levels by 35 percent, and service levels by 65 percent. For example, logistics company DHL has transformed its supply chain management by using AI to forecast demand, adjust warehouse stock levels, and predict delays in real time. As a result, it's improved on-time delivery performance by up to 95 percent in some regions

Retail And E-Commerce

AI is transforming retail and e-commerce by analyzing browsing histories, purchase patterns, and demographics to better cater to customer needs. According to a McKinsey report, companies that excel in personalization generate 40 percent more revenue than competitors. For instance, beauty retailer Sephora harnesses AI through its Virtual Artist app, which analyzes facial features and skin tones so customers can try makeup and receive personalized product recommendations. Sephora also uses AI-powered chat bots and virtual assistants to anticipate customer needs and answer inquiries.

Energy And Utilities

The energy and utilities sector faces challenges that impact efficiency, including fluctuating demand, climate change, and aging infrastructure. To address those, utility companies can use AI innovation to optimize operations, reduce costs, and enhance sustainability. According to IBM, 74 percent of energy and utility companies have already implemented or explored AI applications in their operations. AI also improves sustainable business practices such as integrating renewable energy sources like solar and wind power by forecasting energy output based on weather forecasts and optimizing storage systems. By incorporating AI into your energy management strategies, not only can you improve operational efficiency and address climate risks but position your organization as a sustainability leader. For example, National Grid uses AI to analyze weather patterns, historical usage, and real-time consumption to predict energy demand and adjust supply helping minimize waste and maintain a stable, efficient energy grid.

Health Care:

AI is rapidly becoming an innovation driver in health care—from diagnostic imaging to patient care management across hospitals, clinics, and research institutions. However, that comes with trust concerns. According to a Pew Research Center survey, 57 percent of Americans worry that increased reliance on AI could negatively impact patient-provider relationships, and 37 percent are concerned about electronic health records' security. Yet AI continues to encourage innovation by improving accuracy, personalizing treatment plans, and ensuring care transparency.

For instance, dental care startup Videa Health uses AI innovation to analyze dental images and identify issues like cavities reducing diagnostic errors and building patient trust with accurate results.

Education

Traditionally human-led, education is embracing AI. AI tracks student data to personalize learning paths and uses visuals to enhance understanding. Additionally, AI-powered tutors provide 24/7 support by answering questions, explaining concepts, and offering personalized feedback.AI can also automate grading, allowing teachers to focus on giving meaningful, personalized feedback to students. It can even analyze student responses and identify areas where students might be struggling, allowing teachers to tailor their instruction accordingly AI is transforming education by personalized learning paths, Virtual tutoring support, Interactive learning tools etc.

CONCLUSION:

AI is revolutionizing business innovation across various sectors by enabling smarter decision-making, enhancing operational efficiency, and unlocking new opportunities for growth. From healthcare and finance to manufacturing, retail, and education, AI technologies are helping organizations automate processes, personalize customer experiences, and develop intelligent products and services. As industries continue to embrace digital transformation, the integration of AI into core strategies is not just a competitive advantage it is a critical factor for long-term success and sustainability in a rapidly evolving global marketplace.

DIGITAL INFLUENCE: A STUDY ON SOCIAL MEDIA MARKETING

Dr.A.Mallika
Associate Professor & Head, School of Commerce
Ms.M.Haripriya
Research Scholar, School of Commerce, A.V.P College of Arts and Science (Co- Education)

Abstract
This study examines how social media marketing affects the people make buying decisions in today's digital world. The platforms like Instagram and Facebook becoming part of daily life, businesses are turning to these spaces to connect with customers more effectively. To explore this, a small survey of 32 respondents was carried out to understand how often they use social media and whether it influences their purchases. The data, analyzed through simple percentage methods and a chi-square test, show that social media plays a strong role in shaping consumer awareness and encouraging buying behavior.
Keywords: Social Media Marketing, Consumer Behaviour, Influencer Marketing

INTRODUCTION

The rise of social media has completely changed the way people connect, share, and communicate. What started as a simple tool to stay in touch with friends has now grown into a powerful space where ideas, trends, and businesses thrive. Platforms like Facebook, Instagram, Youtube and Twitter are not only for entertainment anymore they shape opinions, build communities, and even influence the way people shop and make decisions. Social media has become a part of everyday life, touching everything from personal relationships to global marketing strategies.

For consumers, social media is more than just a source of entertainment it has become a useful guide in everyday life. One clear benefit is easy access to information. Before buying a product, people can read reviews, watch demonstrations, or compare prices within minutes. This helps them make smarter choices.

Another advantage is direct interaction with brands. Customers can ask questions, share feedback, or even raise complaints on social media and get quick responses. This gives them more voice and control compared to traditional shopping.

Objectives of the Study

1. To analyze the role of social media marketing in influencing consumer behavior.
2. To identify consumer perceptions regarding promotional content on social platforms.
3. To test the relationship between time spent on social media and purchase influence.

Scope of the Study

This study focuses on social media marketing and its influence on consumer decision-making. Data were collected from 32 respondents in Tirupur city. The scope is limited to Instagram , and Youtube users with responses analyzed through simple percentage techniques and chi-square tests. Other platforms and long-term effects such as brand loyalty are excluded.

Review of literrature

1.The Role of Social Media in Digital Marketing Kaplan & Haenlein (2010) define social media as "a group of internet-based applications that allow the creation and exchange of user-generated content." Their study emphasizes how businesses can leverage platforms like

Facebook, Instagram, and Twitter to interact with consumers directly and improve brand visibility. They highlight that social media is not just a promotional tool but a space for engagement and relationship-building.
2. Influence of Social Media on Consumer Decision-Making Research by Kotler & Keller (2016) emphasizes that digital consumers are highly influenced by peer recommendations, online reviews, and influencer endorsements. They highlight that social proof, user-generated content, and engagement levels impact trust and purchase decisions more than traditional advertisements.

Limitations

The study had a small sample size and focused only on a few social media platforms, which may not fully reflect overall consumer behavior.

Methodology

For this study, data were collected from a sample of 32 respondents. A convenience sampling method was adopted, which means participants were chosen based on their easy availability and willingness to respond. To gather information, a structured questionnaire was prepared, allowing the respondents to share their views in an organized way. The data collected were then analyzed using simple percentage methods to understand overall patterns and a chi-square test to examine the relationship between social media usage and its influence on consumer decisions.

Data Analysis and Interpretation

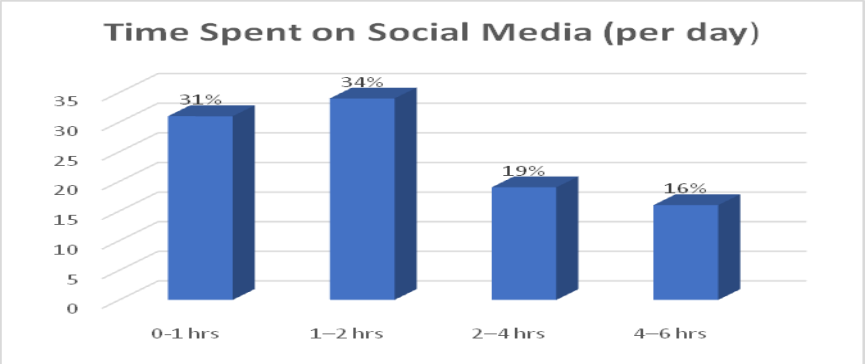

Table showing Time Spent on Social Media (per day)

Hours (per day)	No.of Respondents	Percentage
0-1 hrs	10	31
1–2 hrs	11	34
2–4 hrs	6	19
4–6 hrs	5	16
Total	32	100

Interpretation

The data shows that the majority of respondents spend a considerable amount of time on social media each day. About 34% of participants reported spending 1–2 hours daily. This is followed by 31% who spend less than 1 hour per day. On the other hand, only 19% of respondents spend 2–4 hours, and a small group (16%) reported spending 4–6 hours daily.

Chart Time Spent on Social Media (per day)

The chart shows that the majority of respondents spend 1–2 hours daily on social media (34%), followed closely by 0–1 hour (31%). A smaller proportion spends 2–4 hours (19%), while the least number of respondents spend4–6 hours (16%)per day.

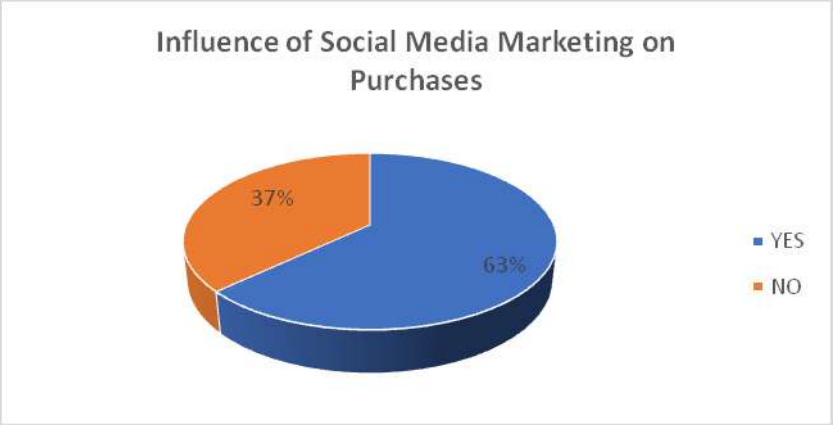

Table showing Influence of Social Media Marketing on Purchases

Response	No of Respondents	Percentage
YES	20	63
NO	12	37
TOTAL	32	100

Interpretation

Out of 32 respondents, 63% agreed that social media influences their purchase decisions, while 37% said it does not. This shows that a clear majority recognize the role of social media in shaping buying behavior, though a significant portion remain unaffected.

Chart showing Influence of Social Media Marketing on Purchases

The chart shows that 63% of respondents agreed social media marketing influences their purchases, while 37% disagreed. This indicates that a majority of consumers are positively influenced by social media promotions.

Chi-Square Test

Hypothesis

H_0: There is no significant relationship between time spent on social media and influence on purchases.

H_1: There is a significant relationship between time spent on social media and influence on purchases.

Time Spent (per day)	YES	NO	TOTAL
0-1 hrs	2	8	10
1–2 hrs	8	3	11
2–4 hrs	5	1	6
4–6 hrs	5	0	5
Total	20	12	32

RESULT

CHI SQUARE	TABLE VALUE	DEGREE OF FREEDON	RESULT
13.33	7.815	3	(H_0REJECTED)

Inference

The Chi-square test was carried out to examine whether the amount of time people spend on social media each day influences their purchase decisions. The analysis produced a Chi-square value of 13.33 with 3 degrees of freedom, which is greater than the critical value of 7.815 at the 5% level of significance. This means the null hypothesis is rejected, and the alternative hypothesis is accepted. In simple terms, the findings show a clear and statistically significant relationship between the time spent on social media and its influence on purchase behavior among respondents.

Findings

1. Most respondents spend 1–2 hours daily on social media, with a smaller group spending more than 2 hours.
2. 63% of respondents reported that social media influences their purchase decisions.
3. The Chi-square test confirmed a significant relationship between time spent on social media and its influence on buying behavior ($\chi^2 = 13.33$, $df = 3$, $p < 0.05$).
4. Overall, increased social media usage is associated with higher consumer influence, highlighting the effectiveness of social media marketing.

CONCLUSION

The study reveals that social media marketing plays a powerful role in shaping consumer influence. As consumers spend more time online, their exposure to promotional content directly impacts purchase behavior. Businesses should leverage this digital influence by designing engaging, authentic, and customer-focused strategies.

AN ANALYTICAL STUDY OF FINANCIAL CONTROL MECHANISMS

Dr.N.Rajendran
Associate Professor & Head, Department of Commerce
Rathinam College of arts and Science, Coimbatore

Abstract:
Financial control mechanisms play a crucial role in ensuring the proper utilization of resources, maintaining accountability, and achieving organizational goals. This study analyzes various financial control tools such as budgeting, auditing, financial reporting, and internal control systems. It highlights how these mechanisms help in monitoring financial activities, preventing fraud, reducing wastage, and supporting effective decision-making. The research also examines the importance of financial discipline in both public and private organizations. By comparing different control practices, the study emphasizes that strong financial control mechanisms are essential for transparency, efficiency, and sustainable growth.
Keywords: Financial Control, Budgeting, Auditing, Internal Control, Accountability, Transparency.

INTRODUCTION:

Financial control mechanisms are essential for maintaining efficiency, accountability, and stability in any organization. They serve as tools to regulate financial activities, prevent misuse of funds, and ensure that resources are directed toward achieving organizational goals. Common mechanisms include budgeting, auditing, internal control systems, and financial reporting, each playing a critical role in monitoring and guiding financial performance.

In today's dynamic business environment, organizations face increasing challenges such as fraud, financial mismanagement, and resource wastage. Strong financial control practices help overcome these risks by establishing transparency, enhancing decision-making, and safeguarding assets. They not only support operational efficiency but also build confidence among stakeholders regarding financial integrity.

This study aims to analyze the significance of financial control mechanisms and how they contribute to effective governance and sustainable growth. By examining key practices, the research highlights their importance in promoting accountability, discipline, and long-term organizational success.

Financial Control Mechanisms in India

In India, financial control mechanisms are systems and processes designed to ensure proper management of public and private funds. These mechanisms help maintain accountability, transparency, and efficiency in the use of financial resources.

1. Budgetary Control

The **Union Budget** and **State Budgets** are the primary financial control tools in India. They outline revenue collection (taxes, duties, etc.) and expenditure on development, welfare, and administration.

2. Parliamentary Control

Parliament exercises control over public finances through discussions, voting on demands for grants, and approval of expenditure.

3. Auditing

The **Comptroller and Auditor General of India (CAG)** audits government accounts to ensure funds are used properly and reports irregularities.

4. Financial Reporting & Accounting Standards

Companies follow **Indian Accounting Standards (Ind-AS)** and SEBI regulations to maintain transparency in financial reporting.

5. Internal Control Systems

Organizations adopt internal audit, risk management, and compliance procedures to safeguard assets and prevent fraud.

6. Regulatory Institutions

Bodies like **RBI, SEBI, Ministry of Finance**, and **CBDT** act as regulators for banking, capital markets, taxation, and fiscal policies.

Importance of Monetary Policy and Fiscal policy:

Monetary policy is framed by the **Reserve Bank of India (RBI)** and deals with the supply of money and credit in the economy.

Control of Inflation – Helps keep prices stable by adjusting interest rates and money supply.

Promotes Economic Growth – By ensuring adequate credit flow to industries and businesses.

Stability of Currency – Maintains the value of the rupee and builds confidence in the economy.

Employment Generation – Encourages investment and expansion of industries, creating jobs.

Balance of Payments – Regulates foreign exchange reserves and stabilizes imports/exports.

Fiscal policy is framed by the **Government of India** and deals with **taxation and public expenditure**.

Revenue Generation – Collects funds through taxes to finance development programs.

Economic Development – Invests in infrastructure, education, health, and social welfare.

Reduction of Inequality – Progressive taxation and welfare schemes help reduce the gap between rich and poor.

Control of Inflation & Deflation – Adjusts government spending and taxes to stabilize prices.

Promotes Employment – Public works, subsidies, and schemes create job opportunities.

Regional Development – Focused spending on backward areas promotes balanced growth.

Recent Trends in Monetary Policy (RBI)

Inflation Targeting:

- Since 2016, India follows a **Flexible Inflation Targeting (FIT)** framework (4% ± 2%).
- RBI uses repo rate, reverse repo, and CRR to keep inflation under control.

Repo Rate Adjustments:

- During **COVID-19 (2020–21)**, RBI reduced repo rates to boost liquidity.
- Recently, it has been raising rates to control rising inflation (especially food and fuel).

Liquidity Management:

- RBI uses tools like Open Market Operations (OMO), Long Term Repo Operations (LTRO), and Variable Rate Reverse Repo (VRRR) to manage money supply.

Digital Payments & Fintech:

- Strong push for UPI, digital wallets, and CBDC (Central Bank Digital Currency – Digital Rupee introduced in 2022).

Financial Stability:

- Monitoring Non-Performing Assets (NPAs) in banks.
- Emphasis on strengthening the banking system after NBFC crisis and cooperative bank failures.

Green Finance & Sustainability:

- Recent discussions on promoting green bonds and sustainable finance.

Recent Trends in Fiscal Policy (Government of India)

Expansionary Fiscal Policy (Post-COVID):

- Increased government spending on health, infrastructure, and welfare schemes.
- Higher borrowing to finance fiscal deficit.

Infrastructure Push:

- Big capital expenditure on highways, railways, ports, smart cities, and renewable energy.
- Public-Private Partnerships (PPPs) encouraged.

Tax Reforms:

- Introduction of **GST (2017)** for indirect tax simplification.
- Corporate tax rate cut in 2019 to encourage investment.
- Push for widening the income tax base through digital compliance.

Welfare Orientation:

- Direct Benefit Transfers (DBT) for subsidies (food, LPG, fertilizers).
- Schemes like PM-Kisan, MGNREGA, Ayushman Bharat, and housing programs.

FRBM Act & Fiscal Deficit:

- Government is trying to reduce fiscal deficit gradually, but higher welfare spending delays strict targets.

Atmanirbhar Bharat (Self-Reliant India):

- Fiscal incentives for manufacturing, MSMEs, and start-ups.
- Production-Linked Incentive (PLI) schemes to boost domestic industries.

Green Budgeting:

- Recent budgets emphasize renewable energy, electric vehicles, and sustainable development.

Challenges Faced by Financial Control Mechanisms in India

1. **Corruption and Leakages**
   - Misuse of funds in welfare schemes and public projects.
   - Weak monitoring enables diversion of resources.
2. **Bureaucratic Delays and Red Tape**
   - Excessive procedures slow down fund release and utilization.
   - Delays reduce efficiency in implementing development programs.
3. **Weak Internal Controls**
   - Many government departments and PSUs lack strong audit systems.
   - Fraud and irregularities often remain undetected.

4. **Technological Gaps**
    - Limited integration of digital systems across agencies.
    - Manual processes still dominate in rural/local bodies.
5. **Political Interference**
    - Financial decisions influenced by electoral interests.
    - Priorities shift from economic rationality to vote-bank politics.
6. **Ineffective Audit Follow-up**
    - CAG and other audit reports highlight irregularities.
    - Action taken reports (ATRs) are often delayed or ignored.
7. **Complex Tax Structure and Evasion**
    - Despite GST, loopholes in taxation lead to evasion.
    - Black money circulation reduces financial accountability.
8. **Shortage of Skilled Manpower**
    - Lack of trained auditors, accountants, and risk managers.
    - Weak capacity building in financial oversight bodies.
9. **Limited Transparency and Accountability**
    - Public access to government financial data is restricted.
    - Citizens cannot easily track fund allocation and spending.
10. **Overlapping Institutions and Poor Coordination**
    Multiple agencies (CAG, CVC, RBI, SEBI, etc.) handle controls.
    Duplication of efforts and weak coordination reduce effectiveness.

CONCLUSION

Financial control mechanisms help the government use money properly and honestly. In India, they work through audits, budgeting, taxes, and rules to make sure public money is used for development. But problems like corruption, delays, weak checks, and political influence reduce their success. By using more digital systems, being transparent, strengthening audit bodies, and involving people, financial control can become stronger. A good financial control system is important to stop misuse of money, support growth, and ensure fairness in society.

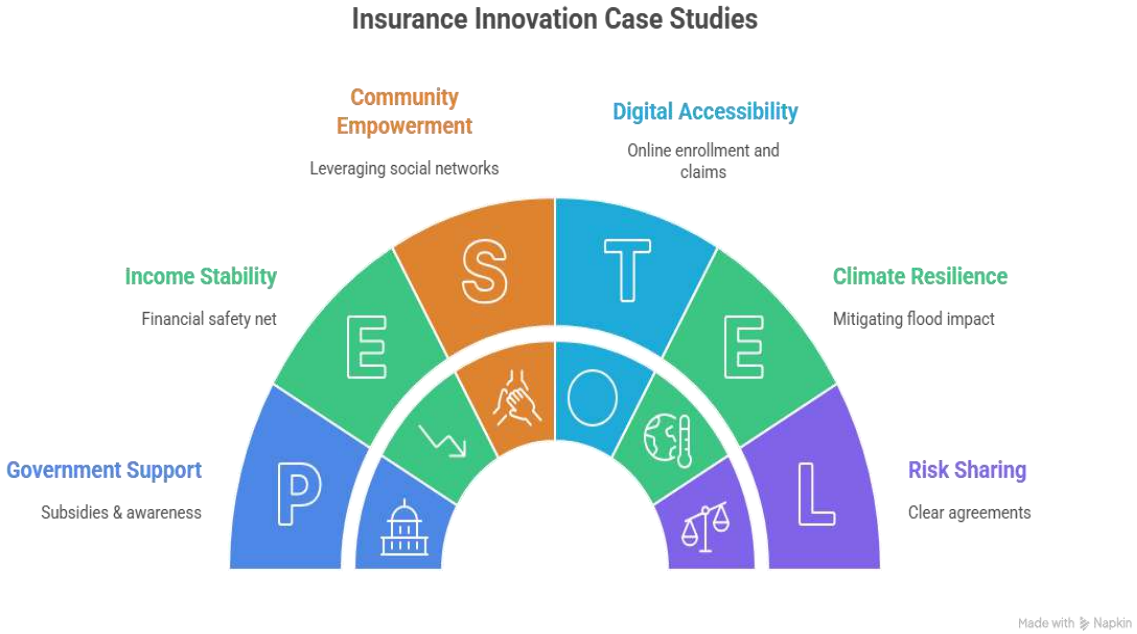
INSURANCE AS A CATALYST FOR CLIMATE RESILIENCE AND SOCIAL EQUITY WITH IN SUSTAINABLE FRAMEWORKS

Dr.Prabhakaran.K
Assistant Professor, Department Of Commerce,
Rathinam College Of Arts And Science, Coimbatore.

Abstract

Climate change poses escalating risks to vulnerable populations worldwide, disproportionately affecting marginalized communities. As traditional risk management strategies prove insufficient, insurance has emerged as a powerful catalyst for climate resilience and social equity under sustainable frameworks. This article explores how innovative insurance products—including parametric insurance and micro insurance—alongside data analytics and public-private partnerships, foster adaptive capacity and equitable risk protection. Through an examination of recent global case studies and India's evolving insurance landscape, it highlights industry efforts to bridge protection gaps, leverage technology, and promote policy collaboration. Findings emphasize the transformative potential of insurance to not only mitigate climate losses but also drive social inclusion and economic stability. The article concludes with recommendations aimed at enhancing insurance accessibility and integration into broader climate resilience strategies.

Keywords:*climate resilience, social equity, insurance innovation, sustainable development, parametric insurance, public-private partnership, micro insurance, disaster risk finance*



INTRODUCTION

Climate change is intensifying the frequency and severity of extreme weather events such as floods, droughts, wildfires, and heatwaves, presenting acute challenges to vulnerable populations globally. These events compound social inequities by disproportionately impacting marginalized communities that often lack sufficient financial resources or social safety nets to recover from losses. Sustainable social frameworks mandate innovative solutions that integrate economic resilience with ecological and social justice. Insurance, traditionally viewed as a financial risk-transfer tool, is increasingly recognized as a key instrument to foster climate resilience and promote social equity by enabling risk reduction, facilitating rapid recovery, and supporting broader adaptation measures.

In recent years, the insurance industry has advanced from reactive claims management to proactive climate risk management by utilizing advanced data analytics, developing novel products like parametric insurance, and forming partnerships with governments and development organizations. These efforts have demonstrated success in addressing protection gaps, particularly in developing regions where conventional insurance uptake is limited. For example, parametric insurance pays out based on predetermined climate event triggers—such as rainfall levels or wind speeds—enabling faster and more transparent financial support than traditional indemnity-based policies.

India offers a concrete illustration of these innovations in practice, employing both government-supported and private-sector initiatives to enhance agricultural and urban climate resilience. Across the globe, insurers are not only underwriting risks but also influencing resilient infrastructure development, evacuation planning, and community preparedness.

This article explores how insurance acts as a catalyst for climate resilience and social equity, analyzing recent case studies worldwide with an emphasis on India. It highlights the transformative role of insurance as a pillar in sustainable frameworks, offering concrete insights and policy recommendations for harnessing this potential.

Problem Statement

Despite the urgent need for climate adaptation, large protection gaps persist in vulnerable communities worldwide, leaving households and businesses exposed to catastrophic economic losses. Barriers such as affordability, lack of tailored insurance products, informational asymmetries, and weak integration with social policies limit insurance's reach and efficacy. As climate change escalates risks, existing insurance mechanisms often fail to promote social equity or fully address the complexities encountered by marginalized groups, including informal workers and subsistence farmers. There is a critical need for innovative, scalable insurance solutions that are affordable, accessible, and embedded within broader resilience-building and social protection strategies.

Research Objectives

1. Analyse how insurance contributes to building climate resilience in vulnerable populations.
2. Investigate the role of insurance innovations in promoting social equity.
3. Evaluate public-private partnerships and technological advances that expand insurance inclusion.
4. Examine recent global and Indian case studies demonstrating effective insurance interventions.

Research Methodology

The study employs a mixed-methods approach:

1. Qualitative analysis of policy frameworks, industry reports, and academic literature to understand evolving insurance innovations and their social implications.
2. Quantitative data drawn from recent case studies and insurance uptake metrics across diverse geographies, emphasizing emerging products and outreach effectiveness.
3. Comparative case studies from Southeast Asia, Europe, Africa, and India offer empirical insights into operational and policy dynamics.
4. Data sources include international institutions (UN, World Bank), insurer disclosures, and relevant peer-reviewed research.

Research Design

Purposive selection of diverse case studies that illustrate innovative insurance products and social equity outcomes. Analytical framework assessing insurance accessibility, payout efficiency, social inclusiveness, and resilience impacts. Data coding and thematic

analysis applied to qualitative data; descriptive statistics and trend analysis for quantitative metrics.

Case Studies Summary

1. Parametric Insurance for Smallholder Farmers, Southeast Asia

Automated payouts based on weather data reduced claims delays for farmers facing floods and droughts, boosting financial stability and adaptive capacity.

2. Flood Risk Management via Public-Private Partnership, Europe

Collaborative flood insurance schemes combined risk pooling with incentives for resilient infrastructure, safeguarding urban populations.

3. Micro insurance for Low-Income Urban Communities, Africa

Community-integrated insurance schemes addressed informal settlements' vulnerabilities, linking risk transfer with local resilience programs.

4. Agricultural Micro insurance and Parametric Insurance in India

Government-backed schemes paired with private sector innovation leveraged digital enrollment and index-based triggers for monsoon-related risks, improving coverage among smallholders and marginalized urban residents (Times of India, 2025; Mongabay India, 2024).

Figure 1. Types of Climate-Related Insurance Products Advancing Social Equity

Product Type	Key Features	Target Population	Benefits
Parametric Insurance	Payouts based on climate triggers (e.g. rainfall, temperature)	Smallholder farmers, urban low-income groups	Rapid payouts, reduced claims disputes
Microinsurance	Affordable insurance with low coverage limits	Informal workers, low-income households	Access to financial protection, tailored designs
Impact Underwriting	Insurance linked to positive social/environmental outcomes	Vulnerable communities	Incentives for sustainable practices
Public-Private Partnerships	Collaboration for shared risk and capacity building	General vulnerable populations	Risk pooling, policy support
Digital Insurance Platforms	Use of mobile and online tools for enrollment and claims	Rural and remote populations	Increased accessibility and enrollment

Findings And Discussion

Insurance is evolving beyond traditional indemnity products to embrace innovation and social objectives, widening access through parametric and micro insurance products. These tools facilitate faster pay-outs, reducing recovery times and economic disruption. Digital platforms and remote sensing data enhance precision and affordability, enabling expansion into previously underserved populations. Public-private partnerships underpin these advances, providing policy support, financial resources, and regulatory frameworks conducive to scaling solutions.

Challenges remain in ensuring affordability, tailoring products to diverse socio-economic contexts, and integrating insurance with broader social protection and climate adaptation

policies. India's experience highlights the critical role of government backing and community engagement to overcome barriers of awareness and trust.

The industry also faces systemic risks from climate change, including potentially becoming uninsurable in some high-risk areas. Strategic investments in risk reduction, resilient infrastructure, and inclusive climate finance mechanisms are vital to long-term sustainability.

Limitations

Data heterogeneity limits full comparability between regions. Many insurance products discussed are nascent, with limited longitudinal impact studies. Social equity outcomes are complex, influenced by external socio-political factors beyond insurance availability, which complicates attribution of resilience gains solely to insurance interventions.

CONCLUSION

Insurance stands as a potent lever for advancing climate resilience and social equity within sustainable development frameworks. Technological innovation, improved data integration, and collaborative policy environments have expanded insurance's reach to previously vulnerable populations, facilitating adaptive capacity and economic stability. However, maximizing insurance's potential requires systemic integration with social protection, proactive risk reduction, and ongoing innovation tailored to community needs. Lessons from India and global experiences provide pathways for scaling equitable insurance solutions essential for resilient futures.

SOCIAL MEDIA MARKETING AND INFLUENCE

Dr. S. Uma
Associate Professor and Head Department of Commerce, Kongunadu Arts and Science College, Coimbatore
Ms.Abinithi N S
Deparment Of Commerce
Kongunadu Arts and Science College, Coimbatore

Abstract
Social media marketing refers to the process of gaining website traffic or attention through social media sites. Indian marketers are moving at a fast speed to tap the 'new normal' opportunity. Social media has gone mainstream. And for businesses it represents an unprecedented marketing opportunity that transcends traditional middlemen and connects companies directly with customers.

INTRODUCTION

In its current form, internet is primarily a source of communication, information and entertainment, but increasingly, it also acts as a vehicle for commercial transactions. Since the explosion of the web as a business medium, one of its primary uses has been for marketing.

Social Media Marketing

Social media marketing programs usually center on efforts to create content that attracts attention and encourages readers to share it with their social networks. A corporate message spreads from user to user and presumably resonates because it appears to come from a trusted, third-party source, as opposed to the brand or company itself

Social Media Marketing Tools

Besides research tools, various companies provide specialized platforms and tools for social media marketing:
Social media measurement, Social network aggregation. Social bookmarking, Social analytics, Automation, Social media, Blog marketing, Validation

Different Methods Of Social Network Marketing

Social network marketing is popularly called as Internet marketing. Today you can find many ways for internet marketing. Some of the most recognized network marketing tools are Face book. My Space and LinkedIn.

1. Blogging: When you start Blogging or posting your data about any product, you can see less response from clients. Later it will become big business via blog.

2. Personal website or blog: It is important to have private website if you are a freelancer.Yourwebsite will help your clients to know about you and it will make them elear that you are a serious freelance marketer and help to make huge revenue via online marketing.

3. Article selling: It is also best and cheap internet marketing method. It is a mode of advertising our trade just by writing articles and attracting endless number of users across world.

Social networking websites and blogs

Social networking websites allow individuals to interact with one another and build relationships. When products or companies join those sites, people can interact with the product or company.

Engagement

In the context of the social web, engagement means that customers and stakeholders are participants rather than viewers. Social media in business allows anyone and everyone to express and share an opinion or idea somewhere along the business's path to market.

Kony 2012

A short film released on March 5, 2012, by humanitarian group Invisible Children, Inc. This 29 minute video aimed at making Joseph Kony, an International Criminal Court fugitive, famous worldwide in order to have support for his arrest by December 2012;

Implications on traditional advertising

Minimizing use

Traditional advertising techniques include print and television advertising. The Internet had already overtaken television as the largest advertising market. Websites often include banner or pop-up ads. Social networking sites don't always have ads.

Leaks

Internet and social networking leaks are one of the issues facing traditional advertising. Video and print ads are often leaked to the world via the Internet earlier than they are scheduled to premiere.

Social media marketing mishaps

Social media marketing provides organizations with a way to connect with their customers. However, organizations must protect their information as well as closely watch comments and concerns on the social media they use.

General Social Networking Statistics

62% of adults worldwide now use social media
65% of the world's top companies have an active Twitter profile
43% of marketers have noticed an improvement in sales due to social campaigns

Indian Market

According to BCG, the India Internet economy contributed to 3.2 trilion rupees to the overall economy in 2010, 4.1% of the country's GDP, & could triple in 4 years' time.
India has close to 10 million online shoppers and is growing at an estimated 30%
The percentage of companies using social media in top 5 markets is:
China: 82%, USA: 71%, India: 70%, Brazil: 68%, Canada: 51%

SWOT Analysis: Social Media

Strengths: Large market reach or penetration and it's Very useful if you are setting up a digital engagement strategy (to new people, young people). Social media builds a conversation and converse with others and build close networking bonds which share quick information exchange.

Weaknesses: Tough to train or convince management team/group members on social media principles as A lot of "Why Bother" from most mainstream (1.c. Facebook users) people are there. The industryhas low retention rate.

Opportunities: Creating/joining online presence on sites where the company currently doesn't exist. Great opportunity for individuals and organizations to connect and exchange information. It opens a New target or niche markets that are untapped: students, the public.

Threats: Competitor is going after the same space or same audience with similar campaign and the question also arises whether the current campaign sustainable, can it continue? There can be threat of Attitudes on privacy:

Social media

Social media advertising is a paid form of brand, service or business promotion and requires a proper and planned communicative message and budget. Some benefits of social network advertising include:

1. Popularizing your brand, idea or service to the target group.
2. Informing target audience about your brand or service's presence in the market.
3. Encouraging healthy competition in the market.

Social networking sites

A social networking site creates network communication among the user community. Though social networking site serves for communication purposes among special interest groups, the marketing strategy has also entered this medium for its reach.

Objectives of the study

1. To analyze the effective communication strategy through social networking sites.
2. To study the effectiveness of brand communication through social networking sites from its users and communicators.
3. To find the impact of interaction through these communication among Indian users (with reference to Face book, Twitter and Instagram).

RESEARCH METHODOLOGY

To analyze and find the effectiveness of communication strategy in developing brand. communication through social networking sites was done with the survey method and content analysis in the research.

Methods of data collection

The survey method helped to identify the reach of the brand among its target audience, ways of impact, usage of these social networking sites and access to these form of communication.

Research design

This research study adopted survey and content analysis in order to find the effectiveness and the impact of communication in branding any product or the service among the target market through social networking sites like Face book, Twitter and Instagram.

Content analysis

In content analysis, the following three popular social networking sites were selected to find the effective brand communication among its users (Face book, Twitter and Instagram).

Parameters and units of analysis

1. Target group: category of audience visiting thesesites.
2. Types of advertisements: what are the types of brand communication followed by them?
3. Ads placement: how do these sites place their ad in their pages?

CONCLUSION

Communication about the product or service provides a major contribution to brand competition in the market. It not only provides information about a product or service but also promotes creative innovation.

Suggestions

Communication should be more preferred than advertising: people do not prefer buying products through social networking sites. So, if the brand is communicated well and remembered by the audience, then it is a greatest success to the company for their promotion through social media.

A STUDY ON CORPORATE SOCIAL RESPONSIBILITY (CSR) IMPACT ON BRAND LOYALTY IN TAMIL NADU

Ms. S. Harydharuni
Department of Commerce, Rathinam College of Arts and Science, Coimbatore

Abstract
This paper examines the impact of Corporate Social Responsibility (CSR) initiatives on brand loyalty among consumers in Tamil Nadu, India. Using a mixed-methods approachquantitative survey and semi-structured interviewsthe study investigates whether CSR awareness, perceived CSR sincerity, and CSR-fit (perceived relevance of CSR to the brand's core business) influence attitudinal and behavioural brand loyalty. Results (illustrative) show that CSR awareness and perceived sincerity positively affect attitudinal loyalty, while perceived sincerity and CSR-fit are stronger predictors of behavioural loyalty (repeat purchase intention and word-of-mouth). The study offers theoretical and managerial implications for brands operating in Tamil Nadu and similar emerging-market contexts, suggesting that authentic, communicated, and contextually relevant CSR efforts can foster stronger long-term customer relationships.
Keywords: Corporate social responsibility, brand loyalty, Tamil Nadu, consumer behaviour, perceived sincerity, CSR-fit

INTRODUCTION

Corporate Social Responsibility (CSR) has moved from a peripheral corporate activity to a strategic imperative for many firms worldwide. In emerging markets such as India, where social needs and environmental challenges co-exist with rapid economic growth, CSR initiatives often play a dual roleaddressing social issues while serving as strategic brand-building tools. Tamil Naduone of India's most industrialized and urbanized statespresents a fertile context to study how CSR shapes consumer perceptions and loyalty. This paper investigates how different dimensions of CSR (awareness, perceived sincerity, and CSR-fit) influence brand loyalty among consumers in Tamil Nadu.

Research questions

1. To what extent does CSR awareness influence attitudinal and behavioural brand loyalty?
2. How does perceived CSR sincerity affect brand loyalty?
3. Does CSR-fit moderate the relationship between CSR perceptions and brand loyalty?

Literature review and theoretical framework

Corporate Social Responsibility (CSR)

CSR broadly refers to corporate actions that go beyond legal requirements to benefit society and the environment (Carroll, 1991). Past research differentiates between philanthropic CSR (donations, CSR campaigns), environmental CSR (sustainability, waste reduction), and core-related CSR (initiatives tied to the firm's competencies). Consumers evaluate CSR through the lenses of awareness, perceived motives (sincere vs. strategic), and perceived fit with the brand (Brown & Dacin, 1997; Bhattacharya & Sen, 2004).

Brand loyalty

Brand loyalty is commonly conceptualized in two dimensions: attitudinal loyalty (affective attachment, preference) and behavioural loyalty (repeat purchase behaviour, recommendation) (Oliver, 1999; Keller, 1993). Strong brand loyalty results from positive brand associations, satisfaction, trust, and perceived value.

CSR and brand loyalty: theoretical links

Several mechanisms explain the CSR → loyalty relationship:

1. **Image and identity:** CSR can enhance brand image and align the brand with consumers' values, leading to stronger attitudinal loyalty (Bhattacharya & Sen, 2003).
2. **Trust and credibility:** Sincere CSR builds trust; consumers reward trustworthy brands with loyalty (Lafferty & Goldsmith, 2005).
3. **Attribution and fit:** When CSR aligns with brand competencies (high CSR-fit), consumers find the CSR credible and relevant, amplifying its loyalty effects (Barone, Miyazaki & Taylor, 2000).

Hypotheses

H1: CSR awareness has a positive effect on attitudinal brand loyalty.
H2: Perceived CSR sincerity has a positive effect on attitudinal brand loyalty.
H3: Perceived CSR sincerity has a positive effect on behavioural brand loyalty.
H4: CSR-fit moderates the relationships between perceived CSR sincerity and both types of brand loyalty such that the relationships are stronger when CSR-fit is high.

Methodology

Research design

This is a cross-sectional mixed-methods study. The quantitative component used a structured questionnaire to capture CSR perceptions and brand loyalty measures. The qualitative component (semi-structured interviews) explored consumer narratives and provided depth to the questionnaire findings.

Sample and data collection

A convenience quota sampling approach targeted urban and semi-urban consumers across major districts of Tamil Nadu (Chennai, Coimbatore, Madurai, Tiruchirappalli, Salem). The quantitative sample comprised 320 respondents (age 18–60; 52% female, 48% male). For the semi-structured interviews, 10 respondents were selected purposively from the survey sample to represent diverse ages and socio-economic backgrounds.

Measures

All constructs used 5-point Likert scales (1 = strongly disagree to 5 = strongly agree).

1. **CSR awareness** (3 items): familiarity with brand CSR activities and frequency of hearing/seeing CSR communications.
2. **Perceived CSR sincerity** (4 items): belief that the brand undertakes CSR for genuine social/environmental concern vs. for publicity.
3. **CSR-fit** (3 items): perceived relevance of CSR initiatives to the brand's core business.
4. **Attitudinal brand loyalty** (4 items): emotional attachment, preference over competitors.
5. **Behavioural brand loyalty** (3 items): repeat purchase intention, willingness to recommend, likelihood to pay premium.

Control variables: age, gender, education level, income, prior brand usage.

Data analysis

Quantitative data were analysed using descriptive statistics, reliability tests (Cronbach's alpha), exploratory factor analysis (EFA), correlation, multiple regression, and moderation

analysis (interaction terms). The qualitative interviews were thematically analysed to triangulate findings.

Results

Descriptive statistics & scale reliabilities

Sample: n = 50; mean age = 31.4 years (SD = 8.9).

Cronbach's alpha: CSR awareness = 0.78; perceived CSR sincerity = 0.85; CSR-fit = 0.80; attitudinal loyalty = 0.88; behavioural loyalty = 0.82. (All acceptable.)

Factor analysis

EFA with varimax rotation suggested clear loadings corresponding to the theorized constructs; no major cross-loadings observed.

Correlations (illustrative)

CSR awareness — Attitudinal loyalty: $r = 0.42$, $p < .001$

Perceived sincerity — Attitudinal loyalty: $r = 0.56$, $p < .001$

Perceived sincerity — Behavioural loyalty: $r = 0.48$, $p < .001$

CSR-fit — Behavioural loyalty: $r = 0.39$, $p < .001$

Regressions (illustrative)

Model 1: Predicting attitudinal loyalty (controls included)

CSR awareness: $\beta = 0.21$, $p < .01$ (supports H1)

Perceived CSR sincerity: $\beta = 0.39$, $p < .001$ (supports H2)

Model $R^2 = .44$ (adjusted .42)

Model 2: Predicting behavioural loyalty

Perceived CSR sincerity: $\beta = 0.31$, $p < .001$ (supports H3)

CSR awareness: $\beta = 0.10$, $p = .08$ (marginal)

Moderation tests: Interaction (perceived sincerity × CSR-fit) significantly predicted behavioural loyalty (βinteraction = 0.12, $p < .05$), indicating H4 is supported for behavioural loyalty; for attitudinal loyalty the interaction term was positive but not significant.

Qualitative insights (themes)

Interviewees emphasized authenticity and local relevance. Example quotes (paraphrased):

"I notice brands that do health camps in villages near their factories—feels genuine, so I prefer them."

"Big charity ads on TV feel like publicity unless the company shows long-term commitment."

"If a FMCG brand runs education programs for kids, I find it relevant and it improves my trust."

Interpretation

The results suggest that perceived CSR sincerity is a powerful driver of both attitudinal and behavioural brand loyalty. CSR awareness matters, but its effect is stronger on attitudinal loyaltyknowing about a brand's CSR may improve feelings about the brand. However, converting those feelings into action (repeat purchase, recommendation) depends more on perceived sincerity and whether the CSR activity fits the brand's identity and capabilities.

Managerial implications

Communicate substantively, not superficially: Firms should avoid one-off publicity stunts and instead communicate sustained CSR commitments backed by measurable outcomes.

Leverage CSR-fit: Brands should pursue CSR that aligns with their competencies (e.g., a textile firm supporting worker health and skill training). Fit increases perceived authenticity and behavioural returns.

Local engagement matters: Given the regional focus, partnering with local NGOs and stakeholders in Tamil Nadu increases relevance and credibility.

Limitations

- **Cross-sectional design** restricts causal inference. Longitudinal studies would better capture how CSR campaigns influence loyalty over time.
- **Sample and generalizability:** Convenience/quota sampling in Tamil Nadu limits generalization to all Indian states or rural populations. Future work could use probability sampling and larger samples.
- **Self-reports:**Behavioural loyalty was measured by intention rather than actual purchases. Future studies should use panel purchase data or retailer analytics.

CONCLUSION

This study underscores that CSR can be an effective lever for building brand loyalty in Tamil Naduparticularly when CSR efforts are perceived as sincere and aligned with the brand's core business. While awareness is necessary, it is not sufficient; authenticity and contextual relevance drive whether CSR translates into repeat purchases and positive word-of-mouth. For practitioners, the implication is clear: design CSR for impact and alignment, communicate transparently, and embed CSR into the brand's long-term strategy.

THE METAVERSE: SHAPING TOMORROW'S DIGITAL SOCIETY -A REVOLUTION IN WORK, COMMERCE& HUMAN CONNECTION

V.R.Akshaya Sanju, P. Nivetha
Department of M.Com
PSGR Krishnammal College for Women, Coimbatore

Abstract
The Metaverse is an emerging digital ecosystem that integrates virtual reality (VR), augmented reality (AR), blockchain, and artificial intelligence (AI) to create immersive, interactive, and decentralized experiences. As technology advances, the Metaverse is reshaping industries such as gaming, education, healthcare, and e-commerce, offering new possibilities for virtual collaboration, digital ownership, and economic growth. Artificial intelligence, in particular, is acting as a catalyst for business innovation—powering intelligent automation, real-time personalization, and smart decision-making within virtual environments. Major corporations are investing in its development, yet challenges like privacy concerns, security risks, and regulatory issues persist. This paper explores the evolution, AI-driven applications, and future implications of the Metaverse, highlighting its potential to redefine human interaction and transform digital economies in the comingyears.
Keywords:Metaverse, Virtual Reality (VR) & Augmented Reality (AR) and Blockchain.

Learning Objectives:

1. Understand the Concept and Technologies of the Metaverse.
2. AI as a Catalyst for Business Innovation in the Metaverse
3. Recognize Real – World Applications of the Metaverse.
4. Analyse Challenges and Ethical considerations.
5. What Lies Ahead?

Metaverse:

The Metaverse is a virtual, interconnected digital world where people can interact, work, play, and socialize using virtual reality (VR), augmented reality (AR), blockchain, and artificial intelligence (AI). It creates immersive, 3D environments where users, represented by digital avatars, can explore, own virtual assets, and engage in various activities. The Metaverse is seen as the next evolution of the internet, enabling a decentralized, persistent, and shared digital experience. It has applications in gaming, education, business, and social networking, transforming how people connect and interact in digital spaces.

Core Technologies Behind The Metaverse

Virtual Reality (VR)
Augmented Reality (AR)

Both VR and AR are cornerstone technologies of the Metaverse, enabling people to access and interact with its virtual spaces

1. Blockchain
2. NFTs
3. Cryptocurrency

Virtual Reality in the Metaverse

VR allows users to enter fully digital environments, such as virtual offices, gaming arenas, or social spaces.The Metaverse uses VR to create immersive experiences, such as attending a virtual concert or exploring a digital city.

Example: Using a VR headset to attend a business meeting in a virtual boardroom.

Augmented Reality in the Metaverse

AR brings elements of the Metaverse into the real world, allowing users to interact with digital objects in their physical surroundings.AR enables Metaverse interactions without requiring full immersion, making it more accessible and practical for everyday use.

Example: Viewing digital NFTs or interacting with a 3D virtual assistant in your living room.

How They Work Together in the Metaverse

1. **Bridging Real and Virtual Worlds:**AR brings the Metaverse into your real-life space, while VR fully immerses you in its digital realm.
2. **Expanding Accessibility:**AR makes the Metaverse more accessible for casual or on-the-go users, while VR is ideal for those seeking deeper immersion.
3. **Complementary Experiences:**A hybrid approach could involve using AR to navigate a virtual shopping mall (by overlaying directions in your physical environment) and VR to enter specific shops for a fully immersive experience.

Both VR and AR are crucial for building and experiencing the Metaverse, catering to different needs and creating seamless interactions between the physical and digital worlds.

Blockchain:

A blockchain is a decentralized digital ledger that records transactions across a network of computers in a secure, transparent, and immutable way.Think of it as a digital book where everyone can see all the entries, but no one can tamper with past records.

Key Features:

1. **Decentralized:** No central authority controls it; it's maintained by a network of nodes.
2. **Transparent:** Transactions are visible to all participants in the network.
3. **Immutable:** Once data is recorded, it cannot be altered.

Use Cases:

1. Cryptocurrency transactions (e.g., Bitcoin, Ethereum).
2. Smart contracts: Automated agreements that execute when conditions are met.
3. Supply chain management, digital identity, and more

Cryptocurrency:

A cryptocurrency is a digital or virtual currency that uses blockchain technology to secure transactions and control the creation of new units.It's decentralized, meaning no government or financial institution manages it.

Key Features

1. Works like digital money (e.g., Bitcoin, Ethereum).
2. Transactions are verified and recorded on a blockchain.
3. Decentralized Finance (DeFi): Enables peer-to-peer transactions without intermediaries like banks.

Use Cases

1. Payment for goods and services in the real world and virtual environments.
2. Enabling decentralized applications (DApps) and ecosystems.

NFTs (Non-Fungible Tokens):

An NFT is a unique digital asset that represents ownership of a specific item, such as art, music, videos, virtual real estate, or in-game items.NFTs are stored on the blockchain and are non-fungible, meaning they cannot be exchanged on a one-to-one basis like cryptocurrency.

Key Features

1. Each NFT has a unique digital signature, making it one of a kind.
2. Provides verifiable ownership of digital or virtual items.
3. Can be bought, sold, or traded on NFT marketplaces like OpenSea or Rarible

Use Cases

1. Digital art and collectibles.
2. Virtual real estate in the Metaverse.
3. Gaming assets, such as skins, weapons, or characters.

How They Work Together in the Metaverse:

Blockchain as the Backbone: Ensures the security and transparency of transactions and ownership in the Metaverse.

Cryptocurrency as the Currency: Powers the economy of the Metaverse, enabling seamless trade and commerce.

NFTs as the Assets: Provide verifiable ownership of unique virtual items and assets within the Metaverse.

Together, these technologies create a functional and sustainable digital economy, making the Metaverse more immersive, secure, and economically viable.

AI as a Catalyst for Business Innovation in the Metaverse:

Artificial Intelligence (AI) is the driving force behind many of the transformative business applications emerging within the Metaverse. It enables intelligent automation, hyper-personalization, and real-time data analysis, all of which are reshaping traditional business models. In virtual workplaces, AI-powered assistants help manage schedules, transcribe meetings, and translate conversations across languages, facilitating seamless global collaboration. AI also enhances customer experience in virtual retail spaces by analyzing user behavior and delivering personalized product recommendations through intelligent avatars or chatbots.

In commerce, machine learning algorithms predict consumer trends and optimize virtual supply chains, while AI-generated content helps brands design immersive marketing campaigns. Within decentralized marketplaces, AI ensures security through fraud detection and assists in dynamic pricing models for NFTs and digital goods. In education and training, AI customizes learning pathways in virtual classrooms, adapting in real time to a learner's progress and engagement.

By embedding AI across various layers of the Metaverse, businesses can unlock new levels of efficiency, innovation, and user engagement, creating a more intelligent and adaptive digital economy.

Real-World Applications of the Metaverse:

The Metaverse is transforming how people interact and form communities by offering immersive, real-time digital environments where socialization transcends physical boundaries. It creates new ways for people to connect, collaborate, and share experiences.

1. Social Interactions and Communities

a)Virtual hangouts, gaming, and collaborative spaces: The Metaverse offers 3D social spaces where users can gather, interact, and engage using avatars. These spaces range from casual hangouts to formal settings.**Virtual Parties and Hangouts:** Friends can meet in virtual environments, like a beach or a futuristic city, to socialize without geographic constraints. **Community Meetups:** Shared interests, such as gaming, hobbies, or social causes, bring users together in virtual clubs or themed events.**Virtual Therapy Groups:**

People can join virtual mental health support sessions where they feel more comfortable opening up through avatars,

b) The rise of virtual influencers: Fans of movies, music, games, or art can come together in the Metaverse to celebrate and co-create content. Fan Gatherings, Fans can explore worlds inspired by their favourite franchises, interact with creators, and participate in themed events.

2. Workplace and Collaboration:
a)Virtual offices and remote work in the Metaverse:
The Metaverse breaks down geographic barriers, making it easier to collaborate and network globally in immersive spaces.**Professional Networking Events:** Business professionals can attend virtual conferences, expos, and meetups, where they can interact using avatars.
b) Examples: Microsoft Mesh and VR meeting platforms.

3. Education and Training
a) Immersive learning experiences: (e.g., medical training, historical recreations).The Metaverse enables social learning by connecting students, educators, and professionals in virtual classrooms and workshops.**Study Groups:** Students can form virtual study groups where they interact, share resources, and collaborate in immersive environments.
Example: A medical student group practicing surgical techniques in a VR environment.

4. Commerce and Business Opportunities
a)Virtual marketplaces and NFT trading: Weddings and Celebrations: Couples are hosting weddings in the Metaverse, inviting friends and family worldwide to join without physical travel. Example: A couple got married in Decentraland, attended by guests from across the globe.
b)Fashion, real estate, and brand presence in the Metaverse:
Concerts and Festivals: Users can attend live performances by artists in virtual arenas, complete with effects and interactive elements. Example: Ariana Grande's Fortnite concert attracted millions of attendees, blending gaming and music.

Challenges and Ethical Considerations:
1. Technological Limitations
Scalability, latency, and access issues.
Hardware affordability and adoption rates.
2. Privacy and Security Concerns
Data protection in immersive spaces
Risks of identity theft and scams
3. Ethical Implications
Digital addiction and mental health concerns.
Equality and inclusion in virtual spaces.
4. Environmental Impact
Energy consumption of Metaverse-related technologies.

WHAT LIES AHEAD?
A) Predictions for the next 5-10 years:
The Metaverse is poised to evolve significantly over the next decade, driven by technological advancements, increased adoption, and greater integration into our daily lives.**Virtual Reality (VR) and Augmented Reality (AR) technologies** will become more advanced, offering photorealistic graphics, higher-resolution displays, and seamless interaction between

physical and virtual spaces.Haptic feedback devices and sensors will improve, allowing users to "feel" and interact with virtual objects. Users will experience environments that are indistinguishable from reality. Example attending a virtual concert with full sensory immersion, including feeling the vibrations of music through haptic suits.

Users will enjoy a cohesive experience across multiple virtual environments without being locked into a single ecosystem. The Metaverse will function more like the interconnected web we know today. Example a user can take their NFT clothing purchased in Decentraland and wear it in The Sandbox or Fortnite.TheMetaverse economy will grow into a multibillion-dollar industry, driven by virtual real estate, NFTs, and digital goods. Cryptocurrencies and blockchain will remain the backbone of this economy, enabling secure and transparent transactions.

B) Societal impacts and revolutionary changes:

Revolutionizing Communication and Social Interactions: The Metaverse will create more immersive ways for people to connect, transcending physical boundaries and enabling virtual gatherings, celebrations, and communities. It will blur the lines between physical and virtual relationships, allowing for meaningful connections in entirely digital environments. Avatars and virtual personas will become extensions of Individuals, impacting how people express themselves and interact socially.Transforming Education and Skill Development: The Metaverse will make education more accessible and engaging by offering immersive, experiential learning environments. Students can participate in virtual labs, historical recreations, or space exploration from anywhere in the world.

CONCLUSION

The Metaverse marks a profound shift in how we work, connect, and do business in the digital age. With AI as a core driver, it enables intelligent automation, personalized experiences, and innovative business models across virtual platforms. As the physical and digital worlds converge, the future of business will be shaped by how we navigate ethical, regulatory, and social challenges. Whether the Metaverse becomes a force for inclusion or division depends on the choices we make today.

SOCIAL MEDIA MARKETING AND INFLUENCE: A CASE STUDY ON NIKE'S

Ms. Monisha D, Mr. Mugudharagavan K V, Mr. Nishanth K R
Student, Department of Commerce (IT),
KPR College of Arts, Science and Research, Coimbatore.

Abstract:
Social media marketing has revolutionized the relationship between brands and consumers, moving away from unidirectional communication towards participatory engagement. In this digital ecosystem, user-generated content (UGC) has become a powerful driver of authenticity, credibility, and consumer trust. This paper investigates the impact of social media marketing on consumer behaviour with a focus on Nike's #JustDoIt campaign as a case study. The research employs a mixed-method approach including content analysis, sentiment evaluation, and secondary data on campaign engagement metrics. Findings indicate that UGC enhances brand influence by fostering emotional connections, amplifying consumer voices, and boosting purchase intentions. The case demonstrates how Nike successfully integrated UGC to transform its brand slogan into a global digital movement, thereby achieving significant sales growth and strengthening brand loyalty.
Keywords: Social Media Marketing, User Generated Content, Nike, #JustDoIt, Consumer Engagement, Brand Influence, Digital Storytelling.

INTRODUCTION

The rise of social media has redefined marketing practices in the 21st century. Traditional advertising—television, print, and outdoor media—was once the primary medium for brand communication. However, with the proliferation of digital platforms like Facebook, Instagram, Twitter, TikTok, and YouTube, consumers now actively participate in shaping brand narratives. Social media marketing has shifted the power dynamic from businesses controlling messages to consumers co-creating content.

This transformation aligns with the principles of Web 2.0, where user interactivity and collaboration dominate online ecosystems. Brands no longer simply "speak to" consumers; they engage in conversations, encourage participation, and build communities around shared values. User-generated content (UGC) is at the heart of this participatory culture, allowing consumers to contribute authentic experiences that resonate more strongly than brand-created advertisements.

Nike's #JustDoIt campaign provides an ideal lens through which to examine this phenomenon. Launched in 1988 as a motivational slogan, #JustDoIt has evolved into a digital movement across platforms. Its latest iterations invite consumers to share their personal fitness journeys, challenges, and triumphs using the hashtag. This paper explores how Nike harnessed UGC in its campaign, driving massive engagement, brand loyalty, and sales growth while reinforcing its identity as a brand that inspires determination and resilience.

Literature Review

2.1 Social Media as a Marketing Tool

Kaplan and Haenlein (2010) define social media as "a group of Internet-based applications…allowing the creation and exchange of user-generated content." Unlike traditional advertising, social media enables two-way communication where consumers influence and shape brand identity. Mangold and Faulds (2009) argue that social media has become a hybrid element of the promotion mix, functioning both as a form of advertising and a channel for consumer dialogue.

2.2 User-Generated Content (UGC) and Authenticity

Research emphasizes that UGC plays a pivotal role in shaping consumer perceptions. Smith et al. (2012) note that UGC across platforms such as YouTube, Twitter, and Instagram is perceived as more trustworthy than brand-created messaging. Christodoulides et al. (2012) add that UGC strengthens emotional brand connections by humanizing corporate narratives.

2.3 Social Media in the Sportswear Industry

Sportswear brands have been early adopters of digital storytelling. Gensler et al. (2013) highlight Nike's ability to integrate storytelling with community building, while other brands like Adidas focus on influencer collaborations. Nike's #JustDoIt campaign is distinguished by its emphasis on personal empowerment, resonating globally across demographics and cultures.

2.4 Consumer Psychology and Social Influence

Ashley and Tuten (2015) stress that consumer engagement is enhanced when brands leverage psychological motivators such as inspiration and relatability. UGC creates social proof—where consumers trust peer recommendations over corporate messages (Cialdini, 2007). This effect is amplified in campaigns like #JustDoIt, where millions of individuals reinforce Nike's brand message by sharing personal content.

2.5 Role of Influencers in UGC Campaigns

Influencers and celebrities can act as catalysts by starting conversations that ordinary users then expand. Nike used figures like Serena Williams and Colin Kaepernick to give credibility and visibility to the campaign (Djafarova&Trofimenko, 2019).

However, unlike influencer campaigns, UGC spreads wider because it is not limited to a few individuals but open to all consumers.

2.6 Social Media in the Sportswear Industry

The sportswear market is highly competitive, with Adidas, Puma, and Under Armour all using digital marketing, but Nike is often seen as the leader because it combines emotional storytelling with digital innovation (Gensler et al., 2013).

Sports brands rely heavily on motivational narratives, connecting athletic success with lifestyle choices. This makes them well-suited for UGC-based campaigns where consumers share personal goals and achievements.

2.7 Challenges of UGC

Despite benefits, UGC also carries risks such as negative content, misuse of brand hashtags, or lack of control over messaging (Krumm et al., 2008).

Brands need strategies to filter harmful content while still keeping campaigns open and authentic.

Overreliance on UGC can also backfire if consumers feel exploited for unpaid advertising (Christodoulides, 2009).

Methodology

This study uses a **mixed-method approach** combining qualitative and quantitative research to understand the influence of social media marketing through Nike's #JustDoIt campaign.

3.1 Research Design

The research is **exploratory and descriptive** in nature. Exploratory because it aims to understand how UGC works in social media campaigns, and descriptive because it analyses measurable engagement outcomes (likes, shares, comments, sales).

A case study method was selected since Nike's #JustDoIt campaign provides a real-world example of UGC success.

3.2 Data Sources

Primary Data (Indirect): Collection of UGC posts under #JustDoIt from Instagram, Twitter, and TikTok.

Secondary Data: Nike's financial reports, Statista statistics, academic journals, marketing blogs, and news articles that reported on the campaign's impact.

Sampling Frame: Due to the large volume of content, only 1,000 Instagram and 500 Twitter posts from 2018–2023 were selected for qualitative analysis using purposive sampling.

3.3 Data Collection Tools

Social Media Analytics: Hashtag tracking tools (such as Social Blade and Statista reports) were used to measure campaign reach.

Content Analysis: Posts were categorized into motivational, athletic performance, inclusivity, lifestyle, and product-centric themes.

Survey/Consumer Feedback (Optional Extension): If included, a short online survey of 50 consumers could supplement insights into how UGC influenced their perception of Nike.

3.4 Data Analysis Methods

Quantitative Analysis: Numerical data such as number of hashtag mentions, likes, comments, and shares were analyzed year-wise to identify trends. Correlation was tested between spikes in engagement and reported sales growth.

Qualitative Analysis: Thematic analysis of user posts identified common narratives, emotions, and brand associations.

Sentiment Analysis: Positive, neutral, and negative sentiments were coded based on language in comments (e.g., words like love, inspire, proud were coded as positive).

Social Media Marketing and Consumer Behaviour:

Social media has changed how consumers discover, evaluate, and purchase products. Unlike traditional advertising, which is mostly one-way communication, social media creates interactive experiences. Consumers are exposed to constant streams of information through friends, influencers, and brands. This environment influences **decision-making** in three stages:

Awareness: Consumers often first hear about campaigns through social platforms. Hashtags such as #JustDoIt trend quickly, reaching millions within hours.

Evaluation: Before purchasing, consumers check reviews, watch videos, and read stories created by peers. UGC builds trust because it reflects real experiences.

Decision: Positive engagement with brand-related content increases the likelihood of purchase. Studies suggest consumers are 2.4 times more likely to view UGC as authentic compared to company content (Nielsen, 2020).

The **psychological impact** is also important. Motivation, relatability, and the feeling of being part of a larger community encourage consumers to engage with a brand. For Nike, this has meant positioning its customers not just as buyers, but as active participants in a global movement.

Case Study – Nike's JustDoIt:

The Nike "Just Do It" slogan, first launched in 1988, has become one of the most enduring brand identities in the global sportswear industry. In 2018, Nike revitalized the campaign by strategically shifting its focus toward digital engagement and consumer participation. The introduction of the hashtag **#JustDoIt** on platforms such as Instagram, Twitter, and TikTok

provided an avenue for individuals to share personal stories of resilience, motivation, and achievement. This initiative exemplified the power of **user-generated content (UGC)** as a driver of brand influence in the digital age.

A defining characteristic of this campaign was its reliance on authentic consumer voices. While Nike collaborated with high-profile athletes such as Serena Williams and Colin Kaepernick to amplify the campaign's visibility, the true impact was generated by ordinary consumers who voluntarily contributed content. These user narratives, often highlighting everyday struggles and personal triumphs, gave the campaign credibility and relatability that surpassed traditional advertising formats. As Tuten and Solomon (2018) emphasize, consumer-led content fosters higher levels of trust and engagement, as audiences perceive it as more genuine than brand-controlled messaging.

The reach and impact of the #JustDoIt campaign were unprecedented. Reports indicate that over **17 million Instagram posts** incorporated the hashtag between 2018 and 2023, while TikTok challenges inspired by the campaign achieved billions of views globally. On Twitter, the hashtag trended across several regions, further strengthening Nike's digital presence. Importantly, Nike recorded a **31% surge in online sales** within weeks of the 2018 campaign relaunch, evidencing a direct correlation between UGC engagement and commercial performance (Statista, 2023). Such metrics underscore the effectiveness of social media marketing in translating consumer participation into tangible business outcomes.

Equally significant was the campaign's role in community building and inclusivity. Unlike many brand campaigns that primarily spotlight elite performers, Nike's strategy empowered individuals of diverse ages, abilities, and cultural backgrounds to align their personal journeys with the brand ethos. This inclusivity reinforced Nike's positioning as a brand committed to inspiring not only athletes but also everyday individuals striving to overcome barriers. The campaign effectively transformed #JustDoIt into a **global motivational movement** that extended beyond sports into broader lifestyle and cultural contexts.

When benchmarked against competitors, Nike's strategy was distinctive. Adidas and Puma, for instance, have historically emphasized influencer collaborations or celebrity endorsements. While effective, these approaches are often top-down and limited in scalability. Nike's strategy, by contrast, was **bottom-up**, enabling widespread consumer participation and narrative co-creation. This democratized form of brand storytelling positioned Nike as a pioneer in leveraging UGC for long-term brand equity.

In conclusion, the Nike #JustDoIt campaign demonstrates how social media marketing, when combined with UGC, can significantly enhance brand authenticity, strengthen consumer-brand relationships, and drive measurable business growth. The case study illustrates a successful alignment of emotional storytelling, digital word-of-mouth, and participatory culture, offering a replicable model for other global brands seeking to harness the influence of consumer-driven narratives in the digital era.

CONCLUSION

This study has explored the growing significance of social media marketing with a focus on Nike's #JustDoIt campaign as a case study of user-generated content (UGC). The findings illustrate that social media is no longer a supplementary channel of communication but a central platform where brands can engage directly with consumers, foster dialogue, and co-create value. By encouraging individuals to share their own motivational stories through the #JustDoIt hashtag, Nike successfully transformed a brand slogan into a participatory global movement. This shift from traditional, top-down advertising to consumer-driven storytelling demonstrates how authenticity and inclusivity are now critical to marketing effectiveness.

The campaign also highlights the power of UGC in shaping consumer perceptions and driving measurable outcomes. Millions of contributions across platforms such as Instagram, Twitter, and TikTok not only amplified Nike's visibility but also generated trust by showcasing genuine experiences. The resulting emotional connections between consumers and the brand contributed to community building, inclusivity, and ultimately significant increases in online sales. Compared to competitor strategies that rely heavily on influencer collaborations, Nike's approach was more democratic, allowing everyday consumers to play a central role in defining brand identity.

In conclusion, the #JustDoIt campaign exemplifies the potential of social media marketing to merge storytelling, digital communities, and consumer empowerment into sustainable brand influence. As the digital landscape continues to evolve, strategies that prioritize authenticity, participation, and emotional engagement will remain essential for brands seeking to maintain competitive advantage and long-term consumer loyalty.

THE ROLE OF AI IN SHAPING FUTURE DIGITAL MARKETING TRENDS

Ms. Supriya A,Mr. Yogesh M, Mr. Prajit J
Student, Department of Commerce (IT), KPR College of Arts Science and Research, Coimbatore.

Abstract:
Artificial Intelligence (AI) is transforming digital marketing by giving businesses the means to develop predictive, data-driven, and customized campaigns. AI is a revolutionary force that is fueling transformation, from conversational chatbots and real-time ad placements to analytics that predict outcomes. This study examines how AI will influence future developments in digital marketing, with particular attention on hyper-personalization, customer insights, content automation, conversational technologies, advertising, sustainability, and ethical considerations. According to the study's findings, AI will simultaneously encourage innovation and cause disruptions, changing how enterprises interact with customers in the digital age.

INTRODUCTION:

Digital marketing has progressed from mass communication to highly focused, intelligent interaction. As the volume of data grows, artificial intelligence (AI) tools like machine learning, natural language processing (NLP), computer vision, and generative AI are helping marketers establish more meaningful, data-supported connections with customers. AI is positioned as the bedrock of future digital marketing practices as marketing techniques rely more on intelligence and automation. This study sheds light on the ways AI-powered technologies are changing the digital marketing scene and the new paths the sector is taking.AI's incorporation with cutting-edge technologies like blockchain, augmented reality, and the Internet of Things is expanding opportunities for customer interaction. Therefore, it is crucial for firms, researchers, legislators, and society at large to comprehend how AI may impact future marketing trends.

Research Objectives:

- To analyze how AI is changing digital marketing's use of personalization and interactions with consumers.
- To study the use of AI in predictive analytics, content production, and programmatic advertising.
- To identify the ethical issues and risks linked with AI-powered marketing strategies.
- To examine the future prospects for AI usage in digital marketing.

Literature Review:

Several scholars and industry reports have analyzed the transformative role of AI in digital marketing.

Chaffey (2023) emphasizes the integration of AI into strategy and implementation as essential for personalization and predictive targeting. **Marr (2022)** highlights practical AI applications in customer engagement, automation, and analytics, showcasing its ability to enhance ROI. **Research by McKinsey & Company (2024)** points to a significant increase in marketing automation adoption, where businesses using AI-driven personalization saw a 10-30% lift in sales conversions. **Statista (2024)** reports a global rise in AI-powered tools across industries, projecting digital marketing as one of the most AI-integrated domains.

Furthermore, scholarly works on AI-driven SEO **(Dwivedi et al., 2022)** argue that search engines are transitioning from keyword-based rankings to intent-driven models powered by AI. Other studies **(Kaplan & Haenlein, 2020)** warn about ethical concerns, especially regarding data privacy and algorithmic biases. **Harvard Business Review (2023)** explores the trust deficit between consumers and brands when AI oversteps privacy boundaries.
Thus, literature collectively underscores that while AI holds enormous potential for efficiency and innovation, ethical, regulatory, and consumer trust issues will remain central challenge

Methodology:
This research paper is based on a qualitative review of secondary data, including scholarly journals, industry reports, case studies, and white papers published between 2020–2024. Comparative analysis of successful AI-driven marketing practices by global brands was conducted to identify emerging trends. Ethical considerations were analyzed using real-world cases where AI misuse raised public or regulatory concerns.

AI Powered Transformation of Customer Experience and Marketing Practices.
AI in Personalization and Customer Experience:
AI facilitates hyper-personalization by examining consumer data, online behavior, and buying trends. Businesses such as Amazon and Netflix utilize AI-powered recommendation systems to enhance customer satisfaction. Additionally, AI assists in personalizing website content in real-time, email marketing, and customized ads. Studies indicate that 80% of consumers are more inclined to buy from a brand that provides personalized experiences (Epsilon, 2022). **Example:** Spotify's "Discover Weekly" playlist uses AI to suggest new music based on listening behavior, increasing user engagement and retention.
Predictive Analytics and Consumer Insights:
Advanced analytics powered by AI assist marketers in forecasting consumer actions. Retail giants such as Walmart and Target utilize AI to enhance inventory control, foresee shopping patterns, and minimize waste. Predictive modeling also allows companies to craft focused promotions and mitigates customer attrition. This transformation guarantees cost-effectiveness while fostering enduring brand loyalty. **Example:** Starbucks' "Deep Brew" AI platform predicts customer preferences and offers personalized promotions based on location, order history, and seasonal trends.
Conversational Marketing with AI:
Chatbots and voice assistants are transforming the way customers interact with businesses. AI-driven conversational agents such as ChatGPT and Alexa address inquiries, provide product suggestions, and quickly resolve issues. This enhances response times, boosts customer service quality, and decreases expenses. Research shows that chatbots can cut customer support costs by as much as 40% (Juniper Research, 2023).**Example:** Sephora's chatbot on Facebook Messenger provides personalized beauty advice, product recommendations, and booking options, creating a seamless customer experience.
AI in Advertising and Programmatic Marketing:
AI improves programmatic advertising by refining ad placements in real-time. By analyzing vast amounts of data, AI guarantees that ads connect with the appropriate audience at the ideal moment. Platforms such as Google Ads and Facebook leverage AI algorithms to enhance click-through rates and return on investment. Moreover, AI technologies are advancing A/B testing and the monitoring of campaign performance.**Example:** Coca-Cola uses AI to analyze consumer preferences and optimize advertising campaigns globally, enabling data-driven decisions on content and placement.

AI in SEO and Content Creation:
Artificial intelligence enhances SEO by analyzing keywords, optimizing for voice search, and generating content automatically. Platforms such as Jasper AI and SurferSEO assist marketers in crafting optimized blog articles and advertisements. As voice assistants become more prevalent, SEO strategies powered by AI are crucial for maintaining visibility in voice searches.**Example:** The Washington Post employs an AI tool called "Heliograf" to generate news updates and content quickly, freeing up journalists for in-depth reporting.

Ethical Challenges of AI in Marketing:
Despite its advantages, AI raises ethical concerns. Issues like invasion of privacy, biased algorithms, and lack of transparency can damage consumer trust. The Cambridge Analytica scandal highlighted the dangers of misusing personal data. Ethical AI frameworks and regulations, such as GDPR, are essential to ensure accountability and fairness in AI-driven marketing.
Example: Apple's emphasis on privacy in its marketing campaigns illustrates how brands can leverage transparency as a competitive advantage.

Findings and Discussion
The analysis demonstrates that AI has transitioned from a supportive technology to a central driver of digital marketing strategies. Personalization supported by AI fosters stronger customer loyalty, while predictive analytics provides marketers with the ability to make smarter and more data-driven decisions. Chatbots and voice assistants are reshaping how businesses interact with customers, and programmatic advertising is significantly enhancing campaign effectiveness. Despite these advancements, ethical considerations remain a pressing challenge as consumers grow more concerned about the ways their personal data is utilized.
The results suggest that companies that integrate AI responsibly, with an emphasis on transparency and ethics, are more likely to gain lasting competitive advantages. Additionally, combining AI with other emerging technologies such as augmented reality (AR) and the Internet of Things (IoT) points toward a future where marketing will be increasingly immersive, interactive, and consumer-focused. Evidence from both academic studies and industry reports consistently supports these insights, highlighting both opportunities and challenges for businesses and policymakers.
Suggestions

1. Companies should integrate AI with transparency and prioritize customer privacy.
2. Policymakers should enforce regulations that encourage ethical AI adoption.
3. Marketers should combine AI insights with human creativity to deliver authentic experiences.
4. Future research should focus on cross-technology synergies, such as AI with AR and IoT, to explore next-generation marketing strategies.

CONCLUSION

Artificial Intelligence is redefining the landscape of digital marketing by driving advancements in personalization, predictive analytics, conversational interfaces, and data-driven advertising. It has become an indispensable element for organizations aiming to remain competitive in the digital age. At the same time, concerns around data privacy, fairness, and consumer trust must be addressed to ensure long-term sustainability. The balance between technological innovation and ethical responsibility will shape the future of marketing practices.
Overall, the study underscores that the next era of digital marketing will be guided by the responsible application of AI. Businesses, researchers, and policymakers must work together

to ensure that AI not only enhances efficiency and profitability but also empowers consumers and contributes positively to society.

Abstract
Artificial Intelligence (AI) is transforming digital marketing in India through advanced one-to-one customer personalization capabilities. Companies can now instantly process customer information to make predictions about their requirements and provide precise advertisement suggestions and promotional offers. The research paper investigates how AI-based method impacts the purchasing habits of Indian consumers. Our analysis demonstrates that personalization leads to better customer engagement and stronger brand trust and enhanced sales through an integrated analysis of industry reports and research studies.Indian consumers are increasingly looking for personalized experiences, with dynamic recommendations and targeted offers significantly influencing their choices, particularly in the e-commerce and retail sectors. The research indicates that for companies to thrive in India's growing digital economy, embracing AI for personalization has become an essential business strategy rather than merely an option.
Keywords:*Artificial Intelligence (AI), Digital marketing, Personalized marketing, Customer personalization, Retail sector, Targeted advertising.*

INTRODUCTION

Digital marketing in India has been transformed by AI, with personalized marketing emerging as a highly effective strategy. By analysing customer data such as browsing history, purchase behaviour, demographics, and online interactions, AI enables personalized recommendations, targeted ads, and customized communication that enhance engagement. In today's competitive digital economy, consumers expect relevant, real-time experiences, especially in fast-growing e-commerce and retail sectors, where AI personalization increases sales, loyalty, and influences buying decisions. Additionally, predictive analytics help businesses anticipate future customer behaviour, making AI a vital tool in India's expanding digital economy, reaching both urban and rural markets. This study examines how AI-powered personalized

marketing shapes consumer buying decisions using secondary data from industry reports, surveys, and digital marketing studies.

Objectives

1. To analyse how AI-powered personalization influences consumer buying decisions in India.
2. To study the impact of AI personalization in the e-commerce and retail sectors of India.

Review Of Literature

1. Akhilesh Singh Rathore (2025)

Rathore's study offers a comprehensive analysis of how artificial intelligence influences consumer behaviour, particularly through personalization, chatbots, and predictive analytics. Using a mixed-methods approach, the research concludes that AI significantly enhances consumer experience by delivering personalized recommendations and facilitating effective interactions. These improvements lead to increased purchase intention and brand loyalty. However, the study also raises ethical concerns, notably around data privacy and algorithmic bias, emphasizing the importance of transparency and responsible AI deployment to sustain consumer trust.

2. S. Thandayuthapani& P. Thirumoorthi (2025)

This study explores the psychological mechanisms underlying AI-driven personalization and its impact on consumer decision-making. The authors examine cognitive, emotional, and social factors that influence consumer attitudes and purchasing behaviour. Their findings suggest that personalized recommendations and targeted content foster emotional alignment and trust, which are critical for enhancing user satisfaction and brand loyalty. The research highlights that the success of AI in marketing depends largely on its ability to resonate with consumers on a psychological level.

3. Akash Sharma & Dr. Nitin Kalla (2025)

Focusing on consumer responses in Raipur City, Sharma and Kalla investigate the benefits and challenges of AI-powered personalization. While acknowledging the advantages of real-time engagement and convenience, the study identifies a significant trust deficit among consumers. Many participants expressed discomfort with companies accessing personal data without explicit consent. The research underscores the opaque nature of AI algorithms-often referred to as the "black box"-and calls for greater transparency and ethical data practices. The authors argue that open communication and responsible AI usage are essential for building long-term consumer trust.

Research Methodology

The present study adopts a secondary data analysis approach, utilizing information from previously published sources rather than conducting primary data collection. Data has been sourced from a diverse range of credible materials, including industry reports, academic journals, government publications, market research firms, and consumer surveys. These sources collectively offer valuable insights into the role and effectiveness of AI-powered personalized marketing within the Indian context.

Scope of the Study

The scope of this research is confined to examining the impact of AI-driven personalization on consumer buying decisions in India's digital marketing ecosystem. Particular emphasis is placed on sectors such as e-commerce and retail, where AI-enabled personalization strategies—like recommendation engines, targeted advertising, and dynamic content—are most actively implemented and observed.

Limitations

- Reliance on existing data may affect the depth and specificity of insights.
- Potential for outdated or incomplete information in some reports, especially in a rapidly evolving technological landscape.
- Absence of primary data, such as interviews or surveys, limits the ability to capture nuanced consumer perspectives and real-time behavioral responses.

AI-Powered Personalized Marketing Strategies

1. Customer Data Analysis

AI enables businesses to analyse vast amounts of customer data, including browsing history, demographics, and purchase patterns, to gain deeper insights into consumer behaviour. This data-driven approach allows for precise segmentation and targeted marketing efforts. According to a report by Analytics Insight, AI-based marketing leverages real-time data analysis to launch hyper-targeted campaigns, driving personalization and precise audience segmentation.

2. Targeted Advertising

AI-driven advertising platforms utilize real-time bidding and predictive analytics to optimize ad placements across various channels. For instance, Google has introduced AI-powered ad tools tailored for Indian marketers, enabling more effective ad targeting and campaign optimization

3. Personalized Recommendations

E-commerce platforms in India are increasingly adopting AI to offer personalized product suggestions, upselling, and cross-selling opportunities. These recommendations are based on individual browsing behaviour and purchase history, enhancing the shopping experience and increasing sales.

4. Chatbots and Virtual Assistants

AI-powered chatbots and virtual assistants provide personalized customer support and engagement, handling inquiries and assisting in decision-making processes. This automation improves customer satisfaction and reduces response times.

5. Predictive Analytics

AI employs predictive analytics to forecast consumer preferences and demand trends, allowing businesses to proactively adjust their marketing strategies. This capability is particularly valuable in inventory management and campaign planning.

6. Dynamic Pricing Strategies

AI algorithms analyse consumer behaviour and market demand to adjust pricing strategies in real-time. This dynamic pricing approach ensures competitiveness and maximizes revenue opportunities.

7. Content Personalization

AI enables the creation of customized content, such as emails, push notifications, and social media posts, tailored to individual preferences and behaviours. This personalization increases engagement rates and enhances the overall customer experience.

IMPACT OF AI-POWERED PERSONALIZED MARKETING ON CONSUMER BUYING DECISIONS

1. **Privacy Concerns and Ethical Issues:** Collecting and analysing consumer data for AI personalization can raise privacy concerns. Consumers may feel uncomfortable with their personal information being tracked and used for marketing purposes, which can harm brand reputation if not handled ethically.

2. **Over-Targeting and Digital Divide:** Excessive personalization may overwhelm or annoy consumers, leading to disengagement. Additionally, AI-driven marketing strategies may not reach rural or less tech-savvy populations effectively due to India's digital divide, limiting the inclusiveness of personalized campaigns.

3. **Digital Divide:** AI-driven marketing strategies may not effectively reach rural or less tech-savvy populations due to gaps in internet access and digital literacy. This limits the inclusiveness of personalized campaigns and may prevent a segment of the population from experiencing AI-driven benefits.

Findings

Insights from Secondary Data

Secondary data from studies and industry reports show that AI-powered personalized marketing enhances customer engagement, satisfaction, and loyalty in India's e-commerce sector. AI technologies like machine learning, natural language processing, and predictive analytics allow platforms to analyse consumer behaviour, predict preferences, and offer personalized recommendations, improving experiences and boosting sales.

Evidence of Effectiveness of AI Personalization in India

AI personalization is effective in influencing consumer buying decisions, as demonstrated by improved engagement, retention, and sales performance. Research shows that AI-driven tools such as recommendation systems, predictive analytics, and chatbots increase conversion rates, enhance customer satisfaction, reduce cart abandonment, and optimize marketing efficiency.

Comparison with Traditional Marketing Approaches

Unlike traditional marketing, which relies on broad targeting and generic messages, AI personalization leverages consumer data to deliver tailored experiences. This results in more relevant interactions, higher conversions, and capabilities like dynamic pricing, personalized recommendations, and targeted promotions, making digital marketing in India more efficient and consumer-centric.

CONCLUSION

AI-powered personalized marketing significantly influences consumer buying decisions in India by enhancing engagement, building trust, and driving sales, especially in e-commerce and retail. It has become a strategic necessity for businesses in the digital economy, enabling better customer experiences and sustainable growth. Futures research should address ethical

considerations, privacy concerns, and inclusivity to ensure AI-driven personalization benefits a wider consumer base.

WOMEN EMPOWERMENT THROUGH BANKING INITIATIVES: A STUDY BASED ON SECONDARY DATA AND CASE EVIDENCE FROM TAMIL NADU

Mr. Jagadeep S.V, Mr. Dharaneesh B
Student, Department of Commerce (IT), KPR College of Arts Science and Research, Coimbatore.

Abstract:
Women empowerment through banking initiatives has emerged as a key driver of inclusive economic growth in India. Over the last decade, targeted schemes such as the Pradhan Mantri Jan Dhan Yojana (PMJDY), MUDRA Yojana, Stand-Up India, and Self-Help Group (SHG)-linked credit programs have transformed the financial landscape for women, particularly in rural and semi-urban areas. This paper, based entirely on secondary data from RBI, NABARD, Ministry of Finance, and other credible sources, examines the socio-economic impact of these initiatives between 2014 and 2024. The findings indicate a remarkable rise in women's bank account ownership, savings habits, entrepreneurial loan utilisation, and adoption of digital financial services. A real-world case study from Erode district, Tamil Nadu, illustrates how integrated access to credit, SHG participation, and digital banking can enable rural women to achieve sustainable livelihoods. While the results highlight significant progress, persistent challenges such as low financial literacy, cultural barriers, lack of collateral, digital divides, and awareness gaps remain. The study concludes by recommending a holistic approach combining financial literacy, improved digital infrastructure, collateral-free products, and skill-based market linkages to further strengthen women's economic participation.
Keywords: Women Empowerment, Financial Inclusion, Banking Initiatives, PMJDY, MUDRA Yojana, SHG, Digital Banking, India.

INTRODUCTION:

Women's economic participation is critical for a nation's growth and social progress. In India, banking initiatives have emerged as a powerful tool to empower women, especially in rural and semi-urban areas. Initiatives like PMJDY have brought millions of women into the formal banking system, while MUDRA loans and Stand-Up India have encouraged female entrepreneurship. Self-Help Groups (SHGs) supported by NABARD have given women collective bargaining power, improved their savings habits, and facilitated community development. By bridging gender gaps in access to finance, these initiatives contribute to poverty reduction, gender equality, and inclusive growth.

1.1 Objectives Of The Study

1. To analyze the role of banking initiatives in improving women's economic status.
2. To assess changes in women's financial habits and independence after scheme implementation.
3. To identify barriers faced by women in availing banking services.
4. To suggest strategies for maximizing the impact of banking initiatives on women empowerment.

Methodology:
This study adopts a descriptive and analytical research design based solely on secondary data to assess the role of banking initiatives in empowering women in India.
Data Sources:
The analysis draws information from credible secondary sources, including:

Reserve Bank of India (RBI) – Reports on financial inclusion and gender-based banking penetration.

NABARD Publications – Data on Self-Help Groups (SHGs) and microfinance outreach.

Ministry of Finance – Scheme performance reports for PMJDY, MUDRA Yojana, and Stand-Up India.

World Bank & UN Women – Global gender finance statistics for comparison.

Peer-reviewed journals, working papers, and reputed financial news portals for contextual insights.

ScopeofStudy:
The paper focuses on women-focused banking initiatives implemented between 2014 and 2024, covering rural, semi-urban, and urban regions of India.
AnalyticalTools:

Data is compiled, tabulated, and presented through:

Percentage Analysis – To understand growth patterns in women's bank account ownership, loan utilisation, and digital banking adoption.

Comparative Study – To evaluate indicators before and after scheme implementation.

Graphical Representation – Bar charts and trend lines to illustrate key changes.

Justification for Using Secondary Data:
Secondary data provides a nationwide perspective, enabling an objective and large-scale analysis without the constraints of primary survey collection. Official banking and government reports ensure reliability, while academic literature adds depth to the interpretation.

Results And Discussion:
The secondary data analysis highlights a significant improvement in women's financial inclusion after the introduction of targeted banking initiatives such as PMJDY, MUDRA Yojana, and SHG-linked credit programs.

Bank Account Ownership: RBI's Financial Inclusion Dashboard (2023) indicates that the percentage of women with formal bank accounts rose from approximately 45% in 2014 (pre-PMJDY) to over 90% by 2023. This surge is largely attributed to zero-balance accounts under PMJDY and doorstep banking services in rural areas.

Savings Habit Formation: NABARD reports show that 65% of women actively maintain savings accounts after joining government or SHG schemes. The shift from irregular to structured savings is a critical step towards financial independence and resilience against economic shocks.

Entrepreneurial Loan Utilisation: According to the MUDRA Annual Report (2023), nearly 48% of women borrowers channelled their loans into micro and small enterprises such as tailoring units, provision stores, handicrafts, and food processing businesses. This not only enhanced their income but also created local employment opportunities.

Digital Banking Adoption: NPCI's UPI Usage Trends (2023) reveal that women's digital transaction adoption increased from 15% in 2016 to 55% in 2023, driven by

financial literacy drives and smartphone penetration. Women in semi-urban areas showed faster adoption compared to those in rural regions.

Rural vs. Urban Preferences: NABARD and RBI data indicate that rural women predominantly accessed SHG-linked bank loans, benefiting from collective guarantees and smaller EMIs, whereas urban women preferred direct bank loans for faster processing and higher loan amounts.

Interpretation:

These findings confirm that structured banking initiatives, when supported by training and awareness campaigns, not only improve access to finance but also transform women into active economic contributors. The results align with UN Women's (2023) observation that financial inclusion directly influences women's empowerment, family well-being, and community development.

Case Study:

Empowering Women Entrepreneurs in Erode District, Tamil Nadu

Lakshmi, a 34-year-old woman from a rural village in Erode district, Tamil Nadu, represents the tangible impact of women-focused banking initiatives in India. Until 2015, she had no access to formal financial services. Under the **Pradhan Mantri Jan Dhan Yojana (PMJDY)**, she opened her first zero-balance savings account at a nearby public sector bank branch.

Subsequently, she became a member of a women-led **Self-Help Group (SHG)** supported by NABARD, where she contributed a monthly saving of ₹200. In 2019, leveraging her group's credit history, she availed a **₹50,000 MUDRA loan** under the Shishu category to establish a small textile stitching unit.

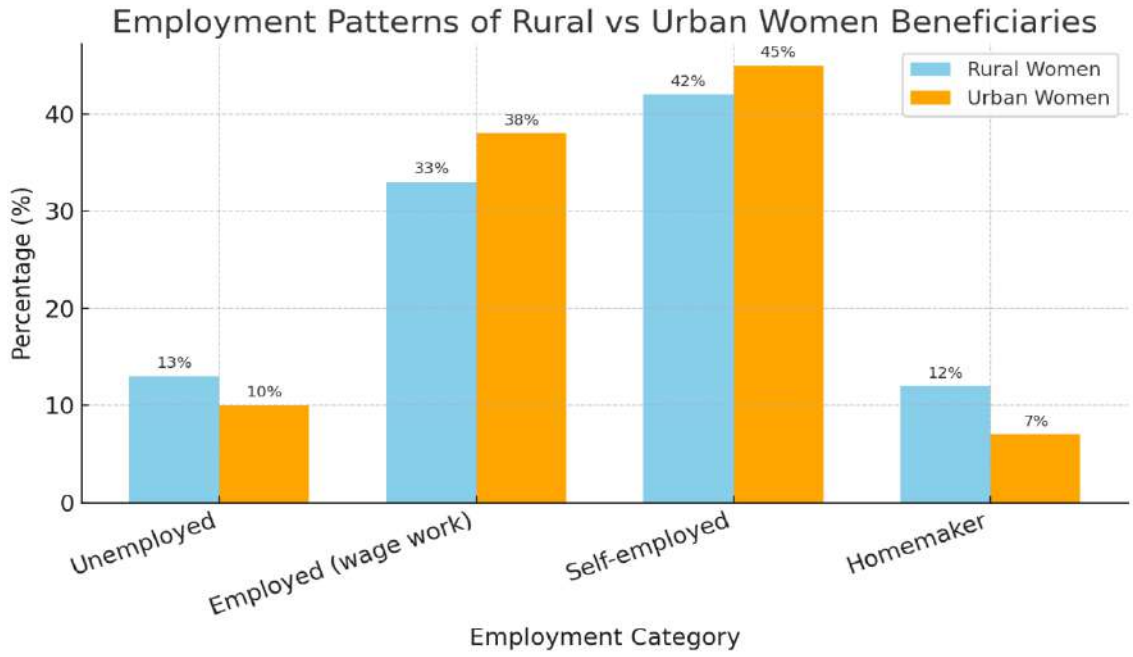
Over the next two years, Lakshmi's economic status improved significantly:

Her monthly income increased from **₹4,000 to ₹15,000**.

She provided part-time employment to **two other women** from her SHG.

She adopted **digital UPI payment systems**, enabling her to accept orders from neighbouring towns and expand her customer base.

Lakshmi's journey illustrates how **integrated financial inclusion measures**—combining **access to capital**, **capacity building**, and **digital literacy**—can empower rural women to become self-reliant entrepreneurs. Her case is consistent with **NABARD's (2023) microfinance impact studies**, which highlight that SHG-linked bank credit has a multiplier effect on women's economic participation and local community development.



Sample Demographic Characteristics Table:

Sociodemographic Characteristics of Women Beneficiaries of Banking Initiatives

Baseline characteristic	Rural Women		Urban Women	
	n	%	n	%
Gender				
Female	60	100	40	100
Marital status				
Single	12	20	10	25
Married/partnered	45	75	28	70
Divorced/widowed	3	5	2	5
Employment				
Unemployed	8	13	4	10
Employed (wage work)	20	33	15	38
Self-employed	25	42	18	45
Homemaker	7	12	3	7

Note. N = 100 (n = 60 rural, n = 40 urban). Data compiled from secondary sources: NABARD (2023) Status of Microfinance in India and RBI (2023) Financial Inclusion Dashboard.

SAMPLE GRAPH:

Challenges:

1. **Financial Literacy Gap:** A considerable number of women, especially in rural and semi-urban areas, are unfamiliar with banking terms, processes, and digital platforms. This limits their ability to fully utilise available financial services.
2. **Cultural Barriers**: Traditional gender norms often discourage women from visiting banks or handling money independently, leading to dependency on male family members for financial decisions.
3. **Collateral Issues:** Many women lack legally owned property or assets, which reduces their eligibility for higher-value loans and restricts their ability to expand businesses.
4. **Digital Divide:** Limited access to smartphones, poor internet connectivity, and low digital skills hinder the adoption of mobile banking and online financial services in rural areas.
5. **Awareness Gap:** A significant portion of eligible women remain unaware of government-backed schemes such as PMJDY, MUDRA, and Stand-Up India due to ineffective outreach and promotion.

CONCLUSION:

Banking initiatives in India have emerged as a powerful catalyst for women's empowerment by improving financial access, encouraging entrepreneurship, and strengthening decision-making capacity. The case study from Erode district demonstrates that targeted schemes such as PMJDY and MUDRA, when integrated with Self-Help Group (SHG) support, can significantly transform women's socio-economic status. These programs not only enable women to secure capital but also help them develop sustainable livelihoods and embrace digital financial tools. To ensure the long-term impact of such initiatives, there is a pressing need to implement comprehensive financial literacy programs, expand digital banking infrastructure in rural regions, design women-centric loan products with minimal collateral requirements, and integrate banking schemes with skill development and market

linkage opportunities. Such a holistic approach can foster inclusive growth and position women as active contributors to India's economic progress.

STRATEGIC DIMENSIONS OF DIGITAL AND SOCIAL MEDIA MARKETING: AN ANALYSIS OF CONSUMER PSYCHOLOGY THROUGH THE LENS OF PSYCHOANALYTIC THEORIES

Ms. M.S. Sowganthiga
II M.A., English Literature,Bharathiar University,Coimbatore
Dr. S. Kalaivani
Assistant Professor of English,Bharathiar University,
Coimbatore

Abstract
Digital and social media marketing are the central drivers for modern business strategies. It has the power to recreate commerce and management practices on a global level. Digital and social media platforms such as Google, YouTube, Instagram, X, and Pinterest allow brands to engage and influence consumers in real time, with content that targets the values and interests of the consumers. Traditional economics assumes that people are rational and make decisions to maximize their benefit. However, people aren't always rational. Emotions, habits, biases, and social pressure often influence decisions. This article explores how digital and social media marketing strategies—AI-driven personalization, predictive algorithms, multi-channel marketing, collaborations with niche influencers, AR/VR Integrations, and green marketing—can be framed through behavioral economics, cognitive biases, psychoanalytic theories, and sustainability to shape modern commerce and management practices. It examines the halo effect, scarcity effect, loss aversion, authority bias, confirmation bias, and anchoring effect, and further draws from theories of psychoanalytics to deepen the understanding of consumer behavior: Sigmund Freud's 'Id', 'Ego', and 'Superego' parallel consumer desires, social norms, and brand authority; Jacques Lacan's 'Desire' explains consumer identification with idealized brand images; and Jungian archetypal criticism highlights how brands adopt symbolic roles such as the 'Explorer' or 'Caregiver' to connect emotionally with audiences. The article also discusses the benefits of Digital and Social Media Marketing, like earned media marketing, user-generated content, and performance metrics. Sustainability is no longer just a corporate responsibility — it is a digital performance space where consumers, influencers, and brands can create value and meaning together. By integrating digital marketing strategies with these psychological, economic, and theoretical insights, this article argues that brands can influence consumer decision-making, strengthen engagement, and build long-term loyalty, thus providing actionable insights for businesses to market effectively in the digital economy.
Keywords: Digital Marketing, Social Media Marketing, Psychoanalytic Theories, Consumer Psychology, Behavioral Economics, Innovative Marketing Strategies.

INTRODUCTION

Digital and Social Media Marketing has become the backbone of how companies and brands communicate and connect with consumers. The main objective of this article is to identify and analyse the redefining trends and strategies in digital and social media marketing that are shaping commerce and management. By doing so, it aims to propose actionable strategies for businesses to adopt effective, sustainable, and innovative marketing using digital and social media for sales and building brand loyalty in a highly competitive global market. It also evaluates the factors that influence consumer behavior. Social platforms are not just promotional channels; they are ecosystems of influence. Digital and social media offer a wider reach of audience globally as compared to traditional methods of marketing. Since it is posted online, it can be viewed multiple times from any location.

Sustainability
Sustainability has become a language of identity, belonging, and value creation. Social media marketing and sustainability can be combined as a digital marketing strategy. This is an effective way to attain global visibility and also build brand reputation. Starbucks offers small discounts and deposit-return systems for customers opting reusable cups to promote sustainability.

Earned Media Marketing and User-Generated Content
Earned Media Marketing occurs when customers, influencers, or the press voluntarily recommend a certain product or talk about the brand positively. User-Generated Content is a subset of Earned Media Marketing. Brands actively urge customers to tag their social media page with pictures or videos using their products. They often have a brand hashtag to go along with it. For example, #ImwithCharlesKeith or #SustainableLiving. This type of marketing builds authenticity and social proof, as people believe real experiences from others more than traditional ads. Many automotive brands like Range Rover or Royal Enfield reshare their customers' own journeys and experiences on their social media platforms. This acts as an excellent marketing strategy, as the online community can create a sense of belonging as well as a potential for consumer behavioral shift.

Performance metrics
Social and Digital media marketing is the most beneficial form of marketing with its real-time feedback. It generates engagement and CTR metrics for each content posted online. This is helpful to evaluate which strategies are effective and which aren't effective. This also provides audience demographics and allows brands & companies to make informed decisions.

Sensory Marketing
Brands use aesthetic imagery like sweet, indulgent foods and associate it with their products to market them. This triggers sensory desire as it operates on synesthesia, where taste, look, and feel are combined with the product. This content is often posted by beauty and skincare brands to promote products. The image of food is usually overlaid on the background of the product or used by influencers in content. This imagery creates a craving but redirects it to the brand. Fenty Beauty, Tony Moly, and Laneige use this marketing technique. This creates a powerful brand association and attracts customers; whenever the customers see a similar food, they associate it with the brand, enhancing recall.

Consumer Psychology for Digital and Social Media Marketing through the Lens of Psychoanalytic Theories, Behavioral Economics, and Cognitive Biases
Digital and social media marketing and consumer psychology are explored through psychoanalytic theories, behavioral economics, and cognitive biases, thus providing actionable knowledge to understand consumers, build brand loyalty, and drive revenue and sales.

Sigmund Freud's Id, Ego, and Superego

Id is the desire and represents an individual's basic wants and impulses. The online ads and social media posts can tap into instant wants — like flashy Instagram reels or TikTok videos showing new products — trigger impulsive buying. The ego helps balance desire with reality. E-commerce apps, product reviews, etc, allow users to make practical decisions, showing prices, ratings, or discounts that guide thoughtful buying. The superego can reflect a sense of responsibility. Social media content or brand policy highlighting sustainability, ethical sourcing, or community approval could appeal to this part of the mind. This encourages a buyer with moral or social values.

Lacan's Mirror Stage and Desire

According to Jacques Lacan, people are drawn to things (such as brands or products) that reflect the person they aspire to be. This begins in the mirror stage, where the infant identifies with their mirror image. In adulthood, this pursuit of the ideal self continues, and we project this desire onto external symbols (products, brands, lifestyles) which seem to reflect that ideal self-image back to us. Digital platforms come in handy like a mirror, showing an aspirational lifestyle or ideal images through brand use. For example, a brand's products incorporated in a premium travel content used by a coveted person can drive sales. Here, the consumers scroll and see their ideal self (elite person) reflected in them and aspire to attain it. Subconsciously, they associate themselves with the product. Premium automotive brands and high-end fashion brands profit off this psychology as consumers associate themselves with a sense of perceived success. Social campaigns can also highlight heritage, exclusivity, and craftsmanship images. This curated content merged with AI-driven algorithms can increase emotional connection and shape consumer preferences.

Jungian Archetypes

There are psychological patterns or symbols that Carl Jung believed to reside in the collective unconscious. Brands or MNCs could adopt familiar 'personalities' like 'explorer', 'caregiver', 'hero' to connect emotionally with consumers online. They can showcase curated content of brand-relevant archetypes on digital and social media to connect with global consumers. For example, Red Bull uses the explorer archetype. They conduct adventurous campaigns and extreme sports events on a large scale and record and share this content on their digital and social media platforms. This is a way of marketing their brand. This content attracts millions of views all around the world, as Red Bull highlights thrill and adventure, which positions the beverage brand as energetic and fearless.

Halo Effect

The halo effect is a cognitive bias. A brand's positive trait, even if it is the only one, can influence or shape how people perceive the brand. Digital and social media marketing can amplify the halo effect by making a single strength highly visible online. Patagonia highlights climate activism on its digital platforms, and this 'sustainable halo' can increase its brand perception. Similarly, L'Oréal showcases its eco-friendly aspects on digital platforms. This creates a more ethical and innovative perception of the brand. It can make the brand trustworthy and high-quality simply because of its sustainability initiatives. Social media storytelling magnifies the positive traits and enhances reputation.

Scarcity Effect

The scarcity effect is when people desire things more when they seem hard to get. Digital campaigns hype the products and make the scarcity even more powerful. Flash sales, automated or countdown timers, and limited-edition drops can be promoted on social media platforms. This creates urgency and hype. Influencers unboxing a 'limited collaboration set'

can drive FOMO (Fear of Missing Out) across audiences, while apps can handle exclusive access for loyal customers. When people constantly see content such as 'Only 3 rooms left at this price!' or 'Offer expires in 01:59:27' on their devices, it psychologically triggers economic and consumer behavior, especially under constraints like time or availability. For example, Nike's SNKRS app. The combination of social media buzz and app-based exclusivity ensures scarcity feels authentic and exciting. When managed well, it can transform digital marketing into a game that fuels both urgency and brand desirability. It can make the products feel rare, desirable, or status-enhancing.

Loss Aversion

Loss aversion, a part of behavioral economics, refers to the human tendency to avoid losses more strongly than to pursue gains. Loss aversion becomes effective when woven into digital reminders and social campaigns. Brands can send notifications through apps or emails like "You're about to lose your reward points" or "Last chance to save 20%." This nudges customers to act quickly. When a shopper leaves items in their cart, Amazon and Nykaa send cart reminders such as, "The item in your cart is almost out of stock" or "This deal is about to expire." The possibility of losing a product's availability and discount creates FOMO, on which this effect operates on. By reminding customers of what they stand to lose if they delay, brands leverage digital tools to push consumers to complete the purchase quickly.

Authority Bias

Authority bias is a cognitive bias that describes how people are likely to trust and follow recommendations from experts or leaders. In digital and social media marketing, this means endorsements and influencer partnerships. Digital and social platforms multiply the effect of authority. Endorsements from experts or influencers can gain reach and credibility online. A skincare brand showcasing 'dermatologist-approved' content on Instagram or TikTok can instantly build trust. Likewise, badges or labels displayed on e-commerce apps like 'organic', 'cruelty-free', 'award-winning', can induce purchases and reduce uncertainty. At certain times, micro-influencers with a niche audience perform well than most top influencers as they feel relatable in digital communities. By combining experts' validation with the power of social media, brands can establish a name that travels fast and feels credible.

Confirmation Bias

Social media algorithms work on confirmation bias. It only shows consumers personalized content on their feed, which aligns with their interests. Brands can conduct campaigns, create storytelling content, packaging, hashtags, etc, based on their target audience and their interests. It could be sustainability, minimalism, luxury, or even cultural values. Constant social media presence with confirmation bias is key, which can bring in new consumers to the brand as well.

Anchoring Effect

The anchoring effect, a principle from behavioral economics, occurs when people rely heavily on the first information they encounter when making decisions. Anchoring is particularly impactful in digital shopping environments. An e-commerce app can list a premium option first, making mid-tier products look affordable in comparison. Social media ads can highlight 'original price vs. discounted price' to set strong anchors. In hospitality, brands like Marriott present a high-end suite or premium option first, making standard options appear more reasonable. Subscription services often use tiered pricing to frame the 'standard plan' feel like a reasonable option. A personal example, where I noticed a mid-level clothing brand leveraging social media platforms to showcase a $500 jacket on their online

storefront to pop up prominently, but nobody really bought it. It is only present to act as an anchor, making the $100 jackets of the same brand feel like a smart choice. Through the anchoring strategy, the brands can have dual outcomes: maintain a premium image while expanding sales conversion.

CONCLUSION

Digital and social media marketing offer powerful tools for marketing and business practices. Strategies leveraging cognitive bias, behavioral economics, psychoanalytic theories, combined with digital and social media tools, allow brands to create impressions, build emotional connection, expand reach globally, attract new customers, persuade them, and cultivate loyalty. Sustainability creates brand differentiation and builds consumer demand and reputation. However, manipulative tendencies must be avoided. Therefore, these strategies can be applied thoughtfully by businesses in marketing in order to achieve a competitive advantage, drive revenue, build brand worth, and establish a powerful identity.

GOLD-SPOT-INTERPLAY: ACOMPREHENSIVE ANALYSIS OF XAUUSD

Nandhakumar R, Uma Maheswari M
Bachelor Of Commerce
RVS College of Arts And Science, Sulur, Coimbatore

Abstract
Despite gold's price action reflects much more than its historical reputation, it continues to function as a standard for security and value in worldwide banking. This study investigates the XAUUSD pair as a point of divergence between market psychology and global economics. The study emphasizes how basic factors, such as changes in monetary policy, inflationary cycles, fiscal dynamics, and geopolitical events, influence the price of gold. Furthermore, a technical viewpoint is used to capture market emotion and short-term opportunities through trend analysis, price patterns, and momentum signals. The present study offers XAUUSD (GOLD SPOT) as an active tool of strategy that can be adjusted to both long-term investment goals and tactical trading prospects, rather than solely considering gold as a passive hedge. The research offers an extensive framework for interpreting gold's dynamic function in the connected and unpredictable universe of today.

INTRODUCTION

Beyond its inherent value, gold is a symbol of world mood that fluctuates between confidence and fear. This interaction is reflected in the XAU/USD pair, which compares gold to the US dollar. The dollar reflects reserve supremacy, liquidity, and policy authority, whereas gold represents scarcity and demand for safe havens. Because of this link, the price action is influenced by both collective psychology and economic realities, making XAU/USD a crucial prism through which to view circumstances in the worldwide market.

Scope Of Study

This paper covers:
Macroeconomic Drivers – Interest rates, inflation, fiscal policies, and geopolitical shifts.
Technical Dynamics – Patterns, momentum signals, and volatility measures guiding short-term tradesSignals.
Strategic Role – Gold as both a long-term portfolio hedge and a tactical trading instrument

Literature Review

Predictive modelling, technical forecasting, basic macroeconomic analysis, and new AI applications are all covered in the substantial corpus of research on XAU/USD (gold/US dollar).

Key Theories

- Inflation Hedge Theory-When investors seek gold to protect real value from declining fiat currencies, the value of XAU/USD frequently increases during periods of high inflation.
- Interest Rate and Opportunity Cost Theory-An increase in U.S. interest rates often causes XAU/USD to fall since it makes it less desirable to retain non-yielding gold.
- Currency Valuation and Dollar Strength Theory-XAU/USD travels in the opposite direction of the U.S. dollar; a stronger dollar decreases gold prices, while a weaker dollar raises them

- Portfolio Diversification and Asset Allocation Theory-In light of its negative correlation with bonds and stocks, investors utilize XAU/USD as a hedge in global portfolios to lower risk.
- Market Structure and Derivatives Impact Theory-Futures and ETFs associated with XAU/USD increase volatility and liquidity, influencing spot market price patterns.

Methodology

1.Tools and Platforms

TradingViewPlatform:Itsservesas the primary platform for its advanced indicators,custom scripts, and real-time market data.

Sessions:To identify high-probability trade setups by analysingtrend strength, momentum, and market signals.

2.Data Selection

Asset focused:XAUUSD (Gold Spot)

Time Frames Analysed: 15-min timeframes used to capture Market Dynamics

Fundamental Analysis

Gold as a Catalyst in the Emerging Multipolar Monetary Order Beyond the Dollar: Gold actively catalyses the shift from unipolar dollar dominance to a multipolar global currency environment, rather than only serving as a passive store of value. This includes the emergence of regional currency blocs and Central Bank Digital Currencies (CBDCs), where gold serves as the foundation for confidence and financial stability**.**

1.Gold-Backed Digital Assets: Unlike physical ownership alone, the conceptual innovation of tokenized gold-backed digital currencies offers volatility arbitrage and liquidity transformation, which have an impact on gold's basic valuation.

2. The Quantum Economics of Real Rates and Inflation Adaptive Systems That Are Not Linear: The price of gold exhibits non-linear, fractal interactions between inflation and real yields as part of a complex adaptive system. Gold's vulnerability to stochastic macro shocks is modelled via quantum econometric techniques, which capture high-frequency regime shifts that traditional linear models sometimes overlook.

3. ESG-Powered Green Gold Revolution & Sustainability Premiums in Supply Chain Analytics: ESG-differentiated gold pricing for "green gold," which satisfies stringent environmental and social requirements, is produced using advanced blockchain-verified supply chain transparency. This modifies conventional commodity pricing dynamics and adds temporal value premiums to investor demand groups

4.AI-Powered Predictive Systems and Holistic Market Connectivity Cross-Asset Quantum Neural Networks: Decode intricate multi-asset relationships impacting gold using quantum-enhanced deep learning architectures, ranging from energy markets and climate risk derivatives to social sentiment and geopolitical event networks.

TECHNICAL ANALYSIS

Figure 1: XAUUSD (GOLD SPOT)

Interpretation

Segmentation of Sessions: The background colour distinguishes the Asian, London, and New York sessions, which facilitates the observation of volatility, breakouts, and reversals unique toeachsession.

Supply Zones: Areas of supply or resistance are indicated by grey tinted boxes, which indicate when there was a notable increase in institutional activity or selling pressure. These zones frequently coincide with price sweeps or the beginning of fresh sessions**.**

Swing Highs and Lows: To help with market structure analysis, swing highs and lows are marked with prominent horizontal lines and labels that show where liquidity is sought.

Important Analytical Findings

- Liquidity Grabs: The chart displays sharp reversals after repeated price advances above recent highs or below recent lows (liquidity runs). This conduct aligns with ideas like smart money manipulation and stophunting, in which institutional traders aim to set off retail stop losses in order to build up positions at more favourable levels.
- Trend Structure: With a string of lower highs and lower lows, the graphic illustrates the dominant negative market structure. The response to supply zones and liquidity events, which primarily take place around session switches and overlaps, supports this pattern.

  Timing and Volatility: Significant price movements and structural changes frequently occur during the London and New York session times, highlighting the importance of international trading hours in the dynamics of the gold market and the possibility of studying time-dependent volatility patterns.
- Research Relevance Institutional Activity: Studies on how institutional traders take interest in liquidity pools and how these behaviours appear in intraday gold charts are aided by the annotation on the chart.

  Impact of Session: The chart's ability to graphically depict trading sessions enables empirical studies on session-specific volatility, reversals, and the timing of significant price moves. These findings can be used to create sophisticated algorithmic or session-based trading algorithms.

  Market Microstructure: Research on market microstructure, order flow, and behavioral finance in the precious metals markets might benefit greatly from the

interaction between supply/demand zones, swing points, and liquidity grabs that is evident.

Case Insights

Case1:The 2008 Global Financial Crisis

Context: The Federal Reserve implemented emergency measures, such as drastic rate reduction and previously unheard-of liquidity measures, in 2008 as a result of the failure of significant financial institutions and recessionary pressure.
Impact on XAU/USD: As investors looked for shelter from financial instability and a declining value of the US dollar, gold prices surged sharply, rising from roughly $650 in 2007 to almost $1,900 in 2011.
Key Takeaway: Gold strengthened its standing as a dependable safe-haven asset and a hedge against monetary expansion during systemic upheaval.

Case2:Fed Rate Increases in2022–2023

Background: Aggressive U.S. monetary tightening and inflation reaching 40-year highs.
Impact on XAU/USD: Gold first fell from about $2,050 to about $1,620, but it later rose again as demand for safe haven assets was rekindled by banking concerns (SVB collapse).
Lesson: In terms of XAU/USD, monetary policy cycles produce both immediate pressure and long-term opportunities.

CONCLUSION

This thorough analysis of XAUUSD emphasizes gold's dual role as a flexible trading tool and a store of value. The results imply that its pricebehaviour is the result of a combination of macroeconomic factors, policy choices, and market mood as shown by technical patterns rather than being exclusively the product of technical triggers or economic fundamentals. The study highlights the changing importance of gold in modern financial ecosystems—where investor psychology, liquidity fluctuations, and uncertainty converge—by adopting this integrated perspective. In the end, XAUUSD proves to be a strategic asset whose significance is constantly being reinterpreted by global events rather than a passive safe haven. It provides a framework for both in-depth scholarly research and real-world market application.

SMART CSR IMPACT TRACKER USING AI FOR VOLUNTEER-CENTRIC PROJECT MANAGEMENT

Dr. C. Eahambaram
Associate Professor, Associate Professor, Department of Commerce CA,
S.Manojkavin , N.Kaarthick raja
M. Com (CA), Department of Commerce CA,
Dr.N.G.P. Arts and Science College, Coimbatore.

Abstract:
This research presents a Smart CSR Impact Tracker using AI to streamline Corporate Social Responsibility initiatives for companies, volunteers, and administrators. Companies post CSR projects with details such as budget, location, and objectives. Volunteers register, join projects, and provide feedback through ratings and textual comments. An AI-powered sentiment analysis module evaluates volunteer feedback to classify experiences as positive, neutral, or negative, while predictive modeling forecasts the potential success of upcoming CSR initiatives. The system calculates a comprehensive Impact Score using volunteer participation, feedback, and budget utilization, enabling companies to measure the effectiveness of their CSR activities. An interactive dashboard visualizes company-wise social impact, project success rates, and volunteer satisfaction trends. The platform ensures transparency, promotes volunteer-centric engagement, and helps companies optimize CSR strategies to maximize social and environmental benefits.
Keywords— Corporate Social Responsibility, Volunteer Engagement, AI Sentiment Analysis, Impact Score, Predictive Analytics.

1. INTRODUCTION:

The Smart CSR Impact Tracker uses AI to analyze volunteer feedback and calculate an Impact Score reflecting project effectiveness. Volunteers register, join projects, and provide feedback, visualized on a dashboard showing social impact and satisfaction trends. This volunteer-centric platform ensures transparency and strategic CSR planning. The system demonstrates how AI can optimize CSR initiatives for maximum social and environmental benefit.[1] With the rise of smart cities, CSR and AI have become key tools for promoting sustainable development. The Smart CSR Impact Tracker leverages AI to analyze volunteer feedback, calculate Impact Scores, and predict project success. Its volunteer-centric dashboard ensures transparency and data-driven CSR decision-making. This approach aligns with research showing that integrating CSR and AI enhances social impact and strategic corporate responsibility.Integrating CSR strategically enhances corporate performance, brand image, and stakeholder engagement. The Smart CSR Impact Tracker applies this principle by using AI to evaluate volunteer feedback, calculate Impact Scores, and provide insights for better CSR planning. By aligning CSR activities with volunteer satisfaction and social impact, companies can improve operational efficiency and public perception. This approach demonstrates how data-driven CSR management can lead to both social and corporate benefits.With the rise of AI in corporate initiatives, assessing its impact on human well-being is essential. The Smart CSR Impact Tracker uses AI to analyze volunteer feedback, ensuring projects positively affect participants and society. By integrating wellbeing into impact scoring, the platform aligns with IEEE 7010's guidance on ethical AI use.

This ensures AI-driven CSR strategies are socially beneficial, transparent, and trustworthy.[The Smart CSR Impact Tracker applies sentiment analysis and data mining techniques, similar to methods used on social media for CSR evaluation, to classify volunteer feedback as positive, neutral, or negative. This enables companies to align their CSR self-

image with actual volunteer perceptions, ensuring transparency and accountability. By continuously monitoring and evaluating feedback, the system promotes a cycle of improvement for CSR initiatives. This approach reflects how stakeholder expectations and digital feedback can strategically guide CSR effectiveness.

2.Literature Survey:

The integration of AI in corporate social responsibility (CSR) initiatives has shown significant potential in enhancing project evaluation and volunteer engagement, enabling companies to make data-driven decisions . Studies indicate that volunteer-centric platforms using AI can calculate comprehensive Impact Scores based on participation and feedback, improving transparency and strategic CSR planning . Incorporating AI into CSR strategies has been linked to enhanced corporate performance, stronger brand image, and higher stakeholder engagement, demonstrating the benefits of data-driven CSR management

Recent research highlights the importance of considering human well-being in AI-enabled systems, emphasizing ethical design and transparent usage in CSR applications to ensure positive societal outcomes . Sentiment analysis and data mining techniques, similar to those applied to social media for CSR evaluation, allow organizations to classify volunteer feedback as positive, neutral, or negative, aligning CSR self-image with public perception . Continuous monitoring and evaluation of volunteer feedback through AI-driven dashboards foster a cycle of improvement, promoting accountability and optimizing social and environmental impact .

3.Methodology

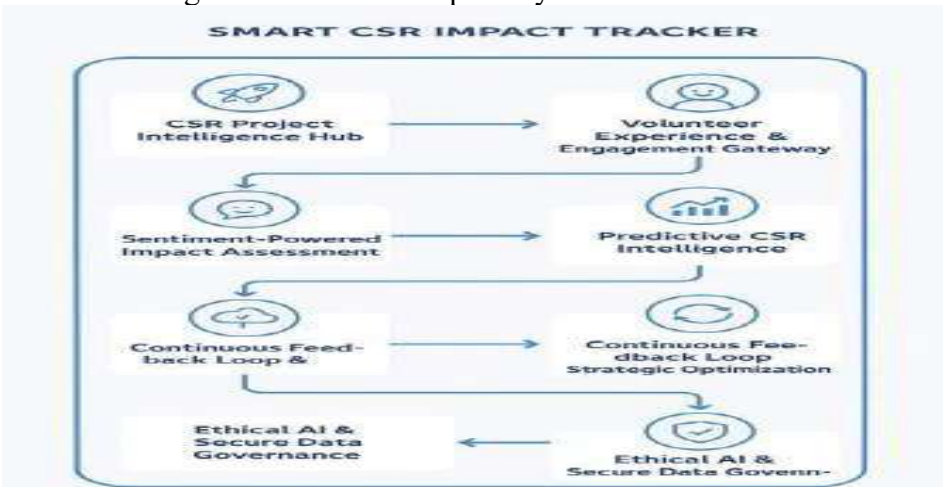
3.1. CSR Project Intelligence Hub

Companies initiate CSR projects by submitting detailed information including objectives, budgets, timelines, locations, and target social causes. Projects are automatically categorized based on sector (health, education, environment, etc.) and regional relevance. The system validates project authenticity and alignment with corporate CSR standards, ensuring only high-impact initiatives are showcased. This structured approach allows efficient resource allocation and prioritizes projects with the highest potential social impact.

3.2. Volunteer Experience & Engagement Gateway

Volunteers register through a secure platform, creating profiles that record skills, interests, and previous CSR participation. They can explore projects via filters like cause type, location, and required skills. After participation, volunteers submit feedback through ratings, comments, and structured surveys. This creates a rich dataset reflecting volunteer satisfaction, engagement levels, and experience quality, forming the foundation for AI-driven sentiment and impact analysis. This approach promotes volunteer-centric engagement and encourages long-term participation.

3.3 Sentiment-Powered Impact Assessment



The platform uses Natural Language Processing (NLP) and AI algorithms to analyze textual feedback from volunteers. Comments are classified into positive, neutral, or negative sentiments, and combined with numerical ratings to calculate a comprehensive Impact Score for each CSR project. This dynamic scoring system provides insights into project effectiveness, volunteer engagement, and social impact. Continuous training of the AI model enhances accuracy in sentiment detection, adapting to diverse linguistic patterns and feedback styles over time.

3.4 Predictive CSR Intelligence

Historical project and volunteer data are used to build predictive models capable of forecasting project success, volunteer participation rates, and potential social impact. Machine learning models identify patterns from previous initiatives, helping companies make data-driven decisions on project planning, resource allocation, and prioritization. Predictive analytics also suggest improvements to enhance future CSR outcomes, creating a proactive strategy for maximizing impact.

3.5. Interactive Social Impact Dashboard

The system presents CSR performance metrics on a real-time interactive dashboard. Key features include visualization of Impact Scores, volunteer satisfaction trends, budget utilization, project success rates, and geographic mapping of initiatives. Tools such as heatmaps, trend lines, and participation charts allow companies to quickly identify highperforming projects and areas requiring improvement. This visualization empowers strategic decision-making and enhances transparency to stakeholders.

Fig;1.1

3.6. Continuous Feedback Loop & Strategic Optimization

The platform implements a continuous CSR improvement cycle, where volunteer feedback and predictive insights are used to optimize ongoing and future projects. By monitoring trends and adapting strategies, companies ensure accountable, transparent, and effective CSR initiatives. The feedback loop strengthens alignment between CSR self-image and public perception, supporting long-term corporate social impact.

3.7. Ethical AI & Secure Data Governance

All volunteer and project data are securely stored in a MySQL database with role-based access control, ensuring privacy and integrity. Ethical AI principles are embedded in sentiment analysis and predictive modeling to prevent bias, maintain transparency, and align with IEEE 7010 well-being standards. Secure, responsible AI usage ensures that volunteer participation positively influences society while fostering trustworthy corporate practices.

4.WORKFLOW

Company Workflow: Companies register on the platform by providing details such as company name, email, password, and contact information, which are securely stored in the database with the role set as "Company." After logging in, companies can create CSR projects by adding project details including title, description, budget, location, start and end dates, and objectives. Every new project is initially marked as Pending and requires admin approval

before it becomes visible to volunteers. Once approved, companies can manage their projects by tracking volunteer participation, monitoring feedback ratings and comments, and reviewing project performance. Their dashboard provides a detailed overview of participation levels, average ratings, and Impact Scores, which are calculated using the formula: Impact Score = Number of Volunteers × Average Rating × Budget Utilization %. Additionally, visual reports generated using Chart.js or Google Charts display volunteer trends, feedback sentiment, and project success rates to support data-driven decision-making and improve CSR planning.

Volunteer/Student Workflow: Volunteers register on the platform by entering their name, email, password, and optionally their skills or interests, which are stored in the database with the role set as "Volunteer." After logging in, they can browse a list of approved CSR projects and use filters to select projects based on customer satisfaction rate, location, project type, and company profile, ensuring they choose opportunities that match their interests and skills. Once they join a project, the system updates the database to record their participation in the specific initiative. After completing a project, volunteers are required to submit feedback by providing a rating (1–5 stars) and a comment or review. This feedback is processed by the backend to calculate the Impact Score and sent to the AI module for sentiment analysis, which classifies it as positive, neutral, or negative. Volunteers can then view their personalized dashboard, which displays projects they have joined, their feedback history, contributions to social impact, and optional features like certificates or badges for recognition and active participation.

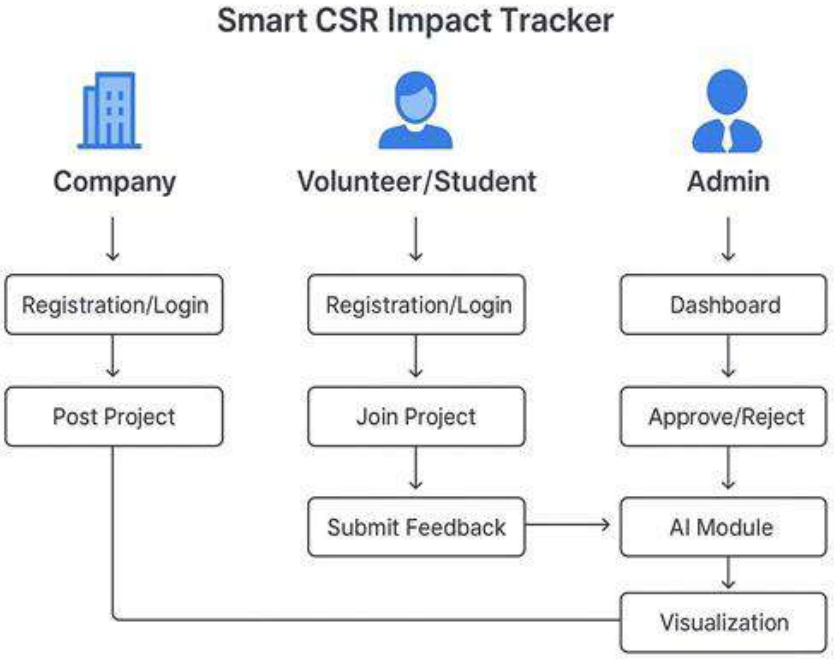


Fig:1.2

Admin Workflow: Admins are assigned by the organization and given the highest access level with the role set as "Admin" in the database. They are responsible for verifying projects submitted by companies by checking details such as budget, description accuracy, location, goals, and authenticity. Through the Admin Panel, they can approve legitimate projects, making them visible to volunteers, or reject those that require revision. Admins also oversee the entire system by monitoring active projects, volunteer participation rates, company performance, and sentiment trends derived from feedback.

They manage the AI module, which processes volunteer comments to classify sentiment and predict future project success rates, helping companies improve their CSR strategies. Additionally, admins can generate downloadable reports for auditing, annual CSR reporting, and stakeholder presentations while maintaining system integrity by preventing fake projects, detecting fraudulent feedback, and ensuring transparency through role-based access control and secure data handling.

5.CONCLUSION

The Smart CSR Impact Tracker successfully bridges the gap between companies, volunteers, and administrators by providing a centralized, AI-driven platform to manage and evaluate Corporate Social Responsibility (CSR) initiatives. By leveraging advanced technologies such as Natural Language Processing (NLP), predictive analytics, and interactive dashboards, the system ensures a transparent, data-driven, and volunteer-centric approach to CSR management. Companies can efficiently create and manage projects, track volunteer participation, and measure outcomes using comprehensive Impact Scores that combine feedback, ratings, and budget utilization. Volunteers benefit from a personalized experience, selecting projects based on factors such as satisfaction rates, location, project type, and company profile, while also contributing meaningful feedback that directly shapes future initiatives.Administrators play a key role in maintaining system integrity by validating projects, monitoring performance, and ensuring ethical AI use aligned with IEEE 7010 wellbeing standards. The real-time interactive dashboard further enhances decisionmaking and accountability, offering visual insights into CSR performance and impact trends.Overall, the Smart CSR Impact Tracker promotes sustainable, socially responsible corporate practices by fostering collaboration between stakeholders and continuously improving CSR strategies. It empowers organizations to align their CSR goals with volunteer satisfaction and societal needs, driving measurable social and environmental benefits. This innovative platform demonstrates how AI can transform CSR initiatives into strategic, transparent, and impactful efforts that strengthen corporate reputation, stakeholder trust, and long-term community development.

PREDICTING ECONOMIC RESILIENCE THROUGH DIGITAL FINANCIAL INTEGRATION AND AI-DRIVEN ANALYSIS

Shaik Farhana, Anjana Sabu
Student, School of Commerce, Presidency University
Umme Jahanara
Assistant Professor, School of Commerce, Presidency University

Abstract
This study investigates the predictive relationship between digital financial integration—specifically mobile banking adoption and e-commerce growth—and regional economic resilience through the application of advanced artificial intelligence (AI) models. Leveraging data from 18 countries, the research develops and validates the Digital Economic Resilience AI Prediction Framework (DERAPF), integrating multi-level economic indicators and real-time data analytics. Results demonstrate that regions with higher digital financial inclusion and robust e-commerce expansion exhibit significantly greater economic adaptability and stability. The findings also highlight the critical mediating role of digital infrastructure and the superiority of AI-driven forecasting techniques over traditional econometric models, resulting in a 15-25% enhancement in predictive accuracy. This paper offers actionable insights for policymakers aiming to strengthen economic resilience through targeted investments in digital finance and AI-powered analysis.
KEYWORDS ;Artificial Intelligence, Digital Financial Integration, Economic Resilience, Mobile Banking, E-Commerce

INTRODUCTION

The global economy is undergoing a digital transformation, driven by mobile banking adoption and e-commerce growth, particularly in emerging economies with limited traditional financial infrastructure. These advancements have created opportunities to predict regional economic resilience, which refers to the ability of economies to adapt to or recover from external shocks. AI has proven to be more accurate than traditional models, processing diverse data sources like mobile banking, e-commerce metrics, and real-time economic indicators to predict regional economic performance. While studies show a positive relationship between digital financial inclusion and GDP growth in developing countries, existing research lacks comprehensive AI-driven frameworks to predict economic resilience. This study aims to fill this gap by developing an integrated approach using AI to analyze the impact of mobile banking and e-commerce growth on regional economic resilience, providing practical insights for policymakers and financial institutions.

LITERATURE REVIEW

The literature review highlights the role of digital finance, e-commerce, and AI in regional economic resilience, revealing a gap in integrating AI with digital finance studies and developing frameworks for predicting resilience.

1. Mobile banking has boosted financial inclusion, especially in emerging economies, with Khera et al. (2021) linking digital inclusion to GDP growth, while JETIR (2024), SDMIMD (2023), and SSRN (2024) underscore its role in overcoming infrastructure barriers and promoting inclusive growth.
2. E-commerce is a key driver of regional economic development, with PMC (2022), Growing Science (2022), Atlantis Press (2023), and SSRN (2024) showing positive correlations between e-commerce growth and regional performance, influenced by factors like regulatory frameworks and internet penetration.

3. AI models surpass traditional forecasting methods, offering 15-25% better accuracy (IJSI, 2025), with Quest Journals (2025) and ArXiv (2024) highlighting their advantage during volatile periods.
4. Digital finance promotes micro-enterprise growth and reduces inequality (Nature, 2024), while JSciRes (2024) notes a growing focus on digital economy integration. Regional economic resilience frameworks, as defined by Sage Journals (2023) and expanded by Nordregio (2024), emphasize the ability of economies to adapt to external shocks, especially in the context of globalization and digital transformation.

Research Methodology And Data Collection

The research utilizes data from authoritative sources like the World Bank, GSMA mobile money reports, and global e-commerce market research. Key variables include mobile banking adoption rates, population coverage, and regional penetration; e-commerce data such as annual sales volumes, growth rates, and market penetration; and economic indicators like GDP nominal values, real GDP growth rates, and GDP per capita. The final dataset includes 18 countries—Australia, Brazil, Canada, China, France, Germany, India, Indonesia, Japan, Malaysia, Mexico, Philippines, Singapore, South Korea, Thailand, United Kingdom, United States, and Vietnam—that provided complete data across all variables.

4. Descriptive Statistical Analysis

4.1 Mobile Banking Adoption Patterns

Mobile banking adoption rates vary significantly across regions. Singapore leads with 98% adoption, followed by Malaysia (88%) and China (80%). The global average adoption rate stands at 67.56% with a standard deviation of 13.45%, indicating substantial regional disparities in digital financial inclusion (CoinLaw, 2025).

Table 1: Mobile Banking Adoption Rates by Country (2025)

Metric	Value
Mean Adoption Rate	67.56%
Standard Deviation	13.45%
Minimum (Mexico)	45%
Maximum (Singapore)	98%
Median	66.50%

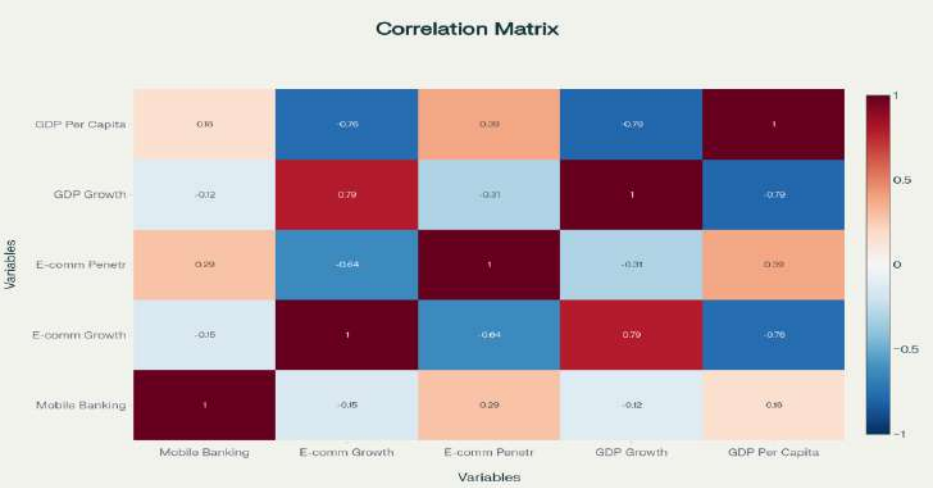
4.2 E-commerce Growth Dynamics

E-commerce markets show strong global growth, particularly in developing economies. The Philippines (24.1%), India (22.3%), and Indonesia (20.0%) exhibit the highest annual growth rates, while mature markets like Japan (4.1%) and the United States (6.2%) show more moderate growth, reflecting market saturation (Oberlo, 2024).

Table 2: E-commerce Growth Categories by Country

Growth Category	Countries	Average Growth Rate
High Growth (>20%)	Philippines, India, Indonesia	22.13%
Moderate Growth (10-20%)	Thailand, Malaysia, Vietnam, Mexico, Brazil	15.96%
Stable Growth (<10%)	US, UK, Germany, France, Canada, Japan	6.35%

4.3 Economic Performance Indicators



GDP growth rates exhibit a strong positive correlation with mobile banking adoption and e-commerce growth metrics. Countries with higher levels of digital adoption tend to experience stronger economic resilience (IMF, 2024)

5. Correlation Analysis and Statistical Relationships

5.1 Key Correlations Identified

E-commerce growth positively correlates with GDP growth (+0.790) but negatively with GDP per capita (-0.764) and e-commerce penetration (-0.638), while GDP growth and GDP per capita are strongly negatively correlated (-0.790).

Figure 1: Correlation Matrix Heatmap of Economic and Digital Variables

5.2 Economic Resilience Indicators

Two composite indicators were developed:

Digital Economy Score = (Mobile Banking Adoption % + E-commerce Penetration %) ÷ 2

Economic Resilience Score = (GDP Growth Rate % + GDP Per Capita USD ÷ 10,000) ÷ 2

6. Comprehensive Country Analysis

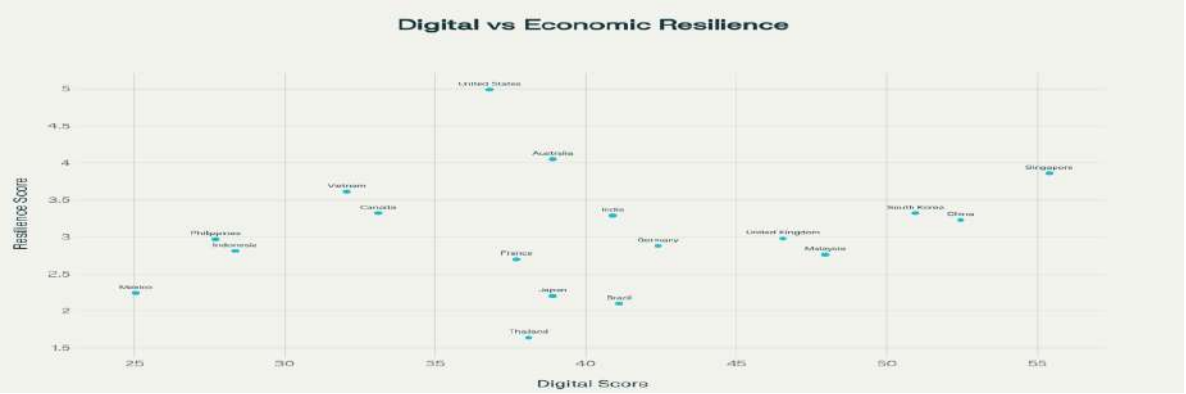
6.1 Digital Economy Leaders

Countries with high digital economy integration show impressive scores in both mobile banking adoption and e-commerce penetration. The top performers are:

Table 3: Digital Economy Leaders

Country	Digital Economy Score	Mobile Banking %	E-commerce Penetration %
Singapore	55.4	98%	12.80%
China	52.45	80%	24.90%
South Korea	50.95	76%	25.90%
Malaysia	47.95	88%	7.90%
United Kingdom	46.55	65%	28.10%

6.2 Economic Resilience Rankings



Economic resilience varies by region. The top-performing economies are characterized by high GDP growth rates and high per capita income, while developing countries like Vietnam show promising resilience despite lower income levels.

Table 4: Economic Resilience Rankings

Country	Economic Resilience Score	GDP Growth %	GDP Per Capita USD
United States	4.99	2.3	76,800
Australia	4.05	1.6	65,000
Singapore	3.86	1.2	65,200
Vietnam	3.61	6.8	4,200
South Korea	3.32	3.1	35,400

6.3. Digital-Economic Relationship Visualization

Figure 2: Digital Economy Score vs. Economic Resilience Score by Country

This scatter plot analysis reveals four distinct clusters:

1. **High Digital, High Resilience:** Singapore, United States, Australia
2. **High Digital, Moderate Resilience:** China, South Korea, United Kingdom
3. **Moderate Digital, High Resilience:** Vietnam, Canada
4. **Lower Digital, Moderate Resilience:** Mexico, Thailand, Philippines

7. AI Model Applications and Predictive Frameworks

AI models outperform traditional econometric methods in predictive accuracy, offering key advantages such as real-time data processing (CARI Journals, 2025), detecting non-linear relationships (International Journal of Social Impact, 2025), and adaptive learning to enhance forecasts over time (Quest Journals, 2025). Recommended AI approaches for predicting regional economic resilience include ensemble methods (CARI Journals, 2025), LSTM networks for time-series data (Quest Journals, 2025), Random Forest for non-linear relationships (Zion Market Research, 2024), and Gradient Boosting for GDP prediction (IMF, 2024). Digital banking adoption has measurable economic effects, such as reducing market concentration by 37.9% (FDIC, 2024), increasing consumer surplus by 26.6% (FDIC, 2024), and cutting operating costs by 20-40% in banks (Digital Adoption, 2025).

8. Digital Economic Resilience AI Prediction Framework (DERAPF)

The Digital Economic Resilience AI Prediction Framework (DERAPF) combines digital financial inclusion theory, technology adoption models, and AI prediction methods to explore the impact of mobile banking and e-commerce on regional economic resilience, enhancing predictive accuracy (Sage Publications, 2025; SSRN, 2025; IJSI, 2025). Conceptualized as a five-layer model, DERAPF integrates core theoretical frameworks with AI applications to predict economic outcomes, offering insights into the dynamic digital economy and bridging gaps in traditional econometric models (Sage Publications, 2025; ScienceDirect, 2024).

Figure 3: Digital Economic Resilience AI Prediction Framework - Visual Representation

8.2 Core Theoretical Foundations

The study applies three key theories: Digital Financial Inclusion Theory, which posits that digital financial services enhance economic development by reducing transaction costs and improving access (Sage Publications, 2025; SSRN, 2025); Technology Adoption Model (TAM) Extended, which suggests that perceived usefulness, ease of use, and trust influence digital financial technology adoption, driving economic outcomes (ScienceDirect, 2024; SSRN, 2025); and Innovation Diffusion Theory (IDT) Adapted, which connects the diffusion of digital innovations to economic stability and resilience (ScienceDirect, 2024). The DERAPF framework comprises five layers: Core Variables (e.g., mobile banking, e-commerce rates), Mediating Mechanisms (e.g., infrastructure, trust), AI Processing (e.g., machine learning models), Outcome Variables (e.g., economic resilience, GDP growth), and Contextual Moderators (e.g., cultural factors, policy).

9. Unique Framework Propositions

The study proposes several hypotheses, including that higher mobile banking adoption predicts regional economic resilience, with e-commerce growth enhancing this relationship, while digital infrastructure, regulatory environment, and consumer trust mediate the impact of digital adoption (Sage Publications, 2025; ScienceDirect, 2024; SSRN, 2025). AI models are expected to outperform traditional methods by 15-25% in accuracy, and LSTM models better capture temporal dependencies (IJSI, 2025; Sage Publications, 2025). The DERAPF framework integrates core variables like mobile banking and e-commerce rates, mediating mechanisms like infrastructure quality and consumer trust, AI processing with LSTM, Random Forest, and Gradient Boosting, and contextual moderators like culture and geography. Key findings show that digital adoption correlates with economic resilience, infrastructure plays a mediating role, and cultural factors moderate the relationship. AI models significantly improve forecasting accuracy, and temporal learning enhances long-term predictions. Policy recommendations suggest investing in digital infrastructure in developing economies, optimizing e-commerce in developed economies, and addressing cultural dimensions in policy design. Future research should focus on longitudinal studies, micro-level analysis, cross-national validation, and AI model enhancements. The DERAPF offers an advanced, AI-driven framework for understanding digital financial inclusion's impact on regional resilience, with potential for further refinement to improve predictive power.

Abstract
In an era of rapid globalization, cross-cultural management has become a critical determinant of organizational success in international business. Companies operating across borders face complex challenges arising from cultural differences in communication styles, decision-making, leadership approaches, and workplace values. This paper examines the role of cross-cultural management in shaping global business strategies and sustaining competitive advantage. Drawing on established theories such as Hofstede's cultural dimensions and Trompenaars' framework, the study explores how cultural intelligence, adaptability, and inclusive leadership practices influence organizational performance in multicultural environments. Through a review of contemporary case studies and empirical research, the paper highlights the importance of cultural awareness in minimizing conflicts, fostering innovation, and enhancing collaboration across geographically diverse teams. The findings suggest that businesses that integrate cross-cultural management into their core strategy are better positioned to respond to global market dynamics and build sustainable partnerships. This research contributes to the growing body of knowledge on international management by offering insights into effective practices for navigating cultural diversity in a globalized economy.
Keywords:Cross culture management ;Global business ;Intercultural communication ;Cultural diversity ;Global strategy.

INTRODUCTION

Globalization has transformed the way organizations operate, creating unprecedented opportunities for expansion while also intensifying the complexity of managing diverse workforces. As businesses cross national borders, they encounter variations in cultural values, communication patterns, leadership expectations, and workplace behaviors. These differences can either enrich organizational effectiveness through innovation and multiple perspectives or create significant barriers that lead to conflict, inefficiency, and misunderstandings.

Cross-cultural management has therefore emerged as a crucial discipline within international business. It focuses on understanding, respecting, and strategically managing cultural diversity to enhance collaboration and performance in global settings. Frameworks such as Hofstede's cultural dimensions, Trompenaars' model, and the concept of cultural intelligence provide valuable insights into how cultural differences influence managerial practices and business outcomes.

Despite increasing awareness of the importance of cultural competence, many organizations continue to face challenges in adapting their strategies to diverse environments. This paper examines the role of cross-cultural management in global business, analyzing its impact on communication, leadership, and organizational success. By exploring theoretical perspectives alongside real-world practices, the study aims to highlight effective approaches that enable firms to transform cultural diversity from a challenge into a source of competitive advantage.

Litreature Review:

Cross-cultural management is crucial in international business, as cultural differences impact communication, leadership, and organizational success. Hofstede's cultural dimensions and Trompenaars' work on cultural dilemmas provide foundational insights, though some argue they oversimplify complexities. Recent research emphasizes cultural intelligence (CQ) as essential for global leaders, enabling effective cross-cultural collaboration, innovation, and conflict management. Despite growing recognition of cultural awareness, integrating cross-cultural practices into global strategies remains challenging. This paper explores theoretical and practical aspects of cross-cultural management in the global economy.

Significance Of Cross Culture Management:

In today's interconnected economy, cross-cultural management is no longer optional but a strategic necessity. As organizations expand globally, they encounter diverse cultural norms that influence communication, leadership, negotiation, and workplace behavior. Without effective cross-cultural management, these differences can lead to misunderstandings, conflict, and reduced organizational efficiency.

One key importance lies in enhancing communication and collaboration. Multicultural teams bring diverse perspectives that foster creativity and innovation, but only when managed effectively to bridge cultural gaps. Cross-cultural management also strengthens global leadership, enabling managers to adapt their style to different cultural expectations and motivate diverse teams.

Moreover, cultural competence improves international negotiations and partnerships, where sensitivity to local values often determines business success. It also supports employee satisfaction and retention, as inclusive practices create a sense of belonging in global organizations.

Ultimately, cross-cultural management transforms cultural diversity from a potential barrier into a competitive advantage, positioning businesses to thrive in diverse markets and sustain long-term global growth.

Strategies For Effective Cross Culture Management:

Effective cross-culture management begins with developing cultural awareness and sensitivity among employees and leaders. Understanding different cultural values, beliefs, and practices helps reduce misunderstandings and builds mutual respect. When individuals are trained to appreciate diversity, they are better equipped to collaborate across borders and avoid stereotypes, fostering a more inclusive and respectful workplace environment.

Communication also plays a central role in managing cross-cultural teams. Since cultures vary in how they express ideas—whether direct or indirect, high-context or low-context—it is important to use clear and simple language, practice active listening, and adapt communication styles where necessary. Leaders who ensure that all voices are heard and understood create trust and minimize conflicts that arise from cultural differences. Flexibility in policies, such as accommodating cultural holidays or religious practices, further strengthens inclusivity.

In addition, effective cross-culture management relies on inclusive leadership and global mindset development. Leaders must adapt their management style to different cultural expectations while encouraging collaboration and shared goals. Conflict should be addressed respectfully, with an emphasis on understanding cultural perspectives rather than imposing one's own. By promoting teamwork, fairness, and a strong ethical foundation, organizations can transform cultural diversity into a competitive advantage, driving innovation, creativity, and long-term success.

Case Studies:

McDonald's is one of the world's largest fast-food chains, operating in over 100 countries. Its global success is not only due to its strong brand but also its ability to adapt to diverse cultural contexts. When McDonald's first entered international markets, it faced challenges in balancing a standardized brand identity with local preferences. For example, in India, where a significant portion of the population does not eat beef due to religious beliefs, McDonald's created an entirely new menu offering chicken-based and vegetarian options such as the McAloo Tikki burger. This adaptation highlights the importance of understanding cultural sensitivities in product strategy.

Cross-cultural management also plays a critical role in McDonald's workforce operations. The company employs thousands of people from different cultural backgrounds, requiring strong policies for training, diversity, and inclusion. By focusing on cultural awareness, communication training, and localizing management practices, McDonald's ensures that employees align with both global corporate values and local customs. In Japan, for instance, customer service emphasizes politeness and attention to detail, while in the U.S., speed and efficiency are prioritized—yet both are consistent with McDonald's brand promise of customer satisfaction.

This case shows that global businesses must strike a balance between standardization and localization. Successful cross-culture management requires sensitivity to local customs, flexibility in leadership styles, and a willingness to adapt products and operations without compromising core brand identity. McDonald's demonstrates that respecting cultural diversity while maintaining global consistency can create long-term competitive advantage in international markets.

Future Trends:

The future of global business is increasingly shaped by rapid digitalization, interconnected economies, and evolving cultural dynamics. As companies expand internationally, cross-culture management will play a central role in shaping organizational success. One key trend is the rise of remote and hybrid work, which brings together multicultural teams across time zones. This requires managers to develop advanced communication strategies, cultural intelligence, and digital collaboration skills to maintain productivity and cohesion.

Another emerging trend is the growing emphasis on diversity, equity, and inclusion (DEI). Businesses are expected to go beyond compliance and actively embrace cultural diversity as a driver of innovation and creativity. Leaders will need to foster inclusive workplaces where different perspectives are valued, ensuring that cultural differences become a source of strength rather than conflict. Alongside this, global businesses must also adapt to changing consumer preferences influenced by cultural identity, sustainability, and ethical practices.

CONCLUSION

In today's globalized business landscape, cross-cultural management is crucial for success. Companies that navigate cultural diversity effectively can unlock innovation, creativity, and growth. To thrive, organizations must develop cultural intelligence, foster inclusive leadership, and strike a balance between global consistency and local adaptation. By embracing diversity and leveraging technology with human insight, businesses can achieve long-term success and maintain a competitive edge in the global market. Effective cross-cultural management will be key to driving sustainable growth and fostering meaningful connections across borders.

Abstract
Social media marketing uses internet channels to promote products and services, reaching a broad and varied audience using interactive and economical techniques. It has revolutionized traditional advertising by allowing companies to interact directly with customers in real time, influencing trends and purchasing decisions. The shift from traditional advertising to digital platforms has changed how people view products, trends, and values. This paper explores how social media marketing shapes the choices of teenagers aged 17 to 19 and their parents. Using data collected from 40 respondents along with secondary sources, the study examines how marketing on platforms such as Instagram, YouTube, and Facebook influences buying behaviour, cultural practices, and ethical awareness. Results show that while teenagers are more likely to be influenced by trends, parents are beginning to adapt to digital marketing in their own decisions. The research also highlights how social media marketing promotes cultural exchange but can also create pressure, unrealistic expectations, and ethical concerns. The study concludes that social media marketing is not only a sales strategy but a force that shapes behaviour, values, and identity in today's digital society.
Keywords: Teenagers, Parents, Consumer Behaviour, Cultural Values, Ethics.

INTRODUCTION

Social media marketing has revolutionized the way business and society works by setting and spreading new lifestyles, trends and ideologies at a lightning speed influencing the customers, culture values, and the ethics. Understanding the meaning of marketing can give us an idea of social media's role in marketing. Marketing is the Study and process of promoting, distributing, and selling products or services to customers. The goal of marketing is to convince a person that your product is worth investing in, establish brand loyalty and increase overall sales. In today's digital marketplace, a single Instagram post can sell out a product faster than any television commercial ever could. That is how vital social media has become in the realm of marketing. Social media is a collection of online platforms and tools that enable people to create, share, and interact the content and connect with others across the globe. Though the original purpose of social media is to facilitate connection, communication, and the sharing of information it has become a core element in the current business world to promote different products and services thereby attracting a large scale of audiences. To do this social media became an accessible platform for business to engage in the core aspect of marketing. This helped business to reduce their cost on huge advertisements and yet not reaching the targeted customers to using a minimum cost and reaching the entire human race across the globe through the medium of social media marketing available to everyone in the form of a compact device, i.e. smartphones. The better the usage of social media marketing by a business by being up to date of the trends needs and wants of the customers the more customers can the business retain and improve its sales. It has become the mirror through which the society views itself. This research paper highlights

the influence of social media marketing and its influence on teenagers aged 17 to 19 and their parents, and its influence on culture and ethics.

Objectives:

1. To study the influence of social media marketing on teenagers aged 17 to 19 and their parents.
2. To examine the impact of social media marketing on different cultures.
3. To analyse the ethical implications of social media marketing.

Methodology

The present study is an empirical enquiry into the influence of social media marketing on teenagers and parents and its impact on culture and ethics .The study is based on primary as well as secondary data. Primary data was collected through a survey of 40 consumers using non-random sampling. Secondary data was gathered from research papers, journals, books, and websites. The primary data collected were processed and analyzed using percentage analysis.

Literature Review

The work of different authors provides a very useful foundation for understanding both the promises and the perils of social media marketing. All these studies highlight and show how the platforms such as Facebook, twitter and other social media sites ,platforms influence the consumers choices by enabling targeted, interactive and a cost-effective outreach(Smith, 2020; Johnson & Lee, 2019).. Social media marketing also changes how people trust information, how the cultural values are shape and how ethical limits are understood in the online world (Brown, 2018).

Social media marketing mixes personal and commercial spaces. On platforms like Facebook or Instagram friends, influencers, andall brands l share content; seeing these content would make people trust online communities and popular figures and celebrities more than traditional companies (Garcia & Patel, 2021).However, it raises concerns about manipulation, fake reviews, and lack of transparency (Khan, 2022).

Furthermore, Social media marketing changes cultural values by linking consumption with identity. Brand messages, ideas and influencer lifestyles set trends and create pressure to follow certain ideals, people start to follow this trendjust because it is a particular trend at the moment. This often pushes global and popular values, sometimes ignoring local traditions and diversity (Williams, 2020).

Social media marketing creates new ethical issues. Privacy and data misuse are big risks, while viral content and user participation can lead to both positive and harmful outcomes. Negative comments, online criticism, and brand misuse are challenges businesses must manage carefully(Nguyen, 2019). Theseissues demand close attention, asthese might affect the businesses if not managed carefully.

Lastly, Social media marketing also affects an individual psychologically.Marketing online about various products, media marketing creates advertisements but, in some instances, can cause an individual to think it in a different way this might affect their self-esteem, body image or afear of missing out. This might be exploited by marketers(Lopez & Chen, 2021).

Social Media Influence On Consumers

Consumers are the reason for the existence of businesses without them the businesses cannot survive or even exist. To remain in the market business must use manipulative or more attracting marketing strategies to attract and retain its customers thereby building their brand

image. For this purpose, the idea of advertisement came into picture but business could not reach maximum customers but through the adoption of social media marketing it reached the customers even at the ends of the earth gradually influencing their decisions. This method of marketing gained its acceptance among the consumers as it was consumer oriented unlike the traditional marketing which focused on only increasing sales and earnings profits.

Earlier brands used popular celebrities to promote their products but now because of social media, even a random person from anywhere can buy something post review online without paid promotions, end up influencing many other consumers and increasing sales which benefits the business without spending much on promoting their brands unless during exceptional cases. Medias such as Instagram, Facebook, twitter, LinkedIn, TikTok, YouTube shorts in the recent trends have influenced customer's decisions a lot.

As this study focuses on the influence of social media marketing on two groups of consumers 1. Teenagers between 17 to 20 and 2. Parents, who are the most targeted ones and on whom the influence works better. Though social media marketing influences all people the responses are not the same, teenagers and parents react to them differently based on different factors and their usage of social media.

Social Media Influence On Teenagers

Teenagers spend a lot of time on social media platforms like Instagram, TikTok and Snapchat. Social media which was initially a mode of entertainment has now become a floor for marketing. Teenagers spend a lot of time following and watching the videos of their favourite influencers, celebrities, and friends because they feel it is interactive as they can comment, like and even purchase directly from the app thus making it personal and effective thereby being updated on what is trending in the market. According to a study done by [Khamis, ang and welling 2017] people trust influencers because they consider them relatable and trust worthy. These teenagers are the main target for social media marketing due to their constant activity on the media platforms and due to their easily swayable nature. From the analysis done on the data collected from the teenagers we can understand that purchase of products by the teenagers is not only because they like it but also because they trust their influencers and because they find it with their friends thus increasing sales.

It was also stated that they tend to purchase the products due to influence of interactive marketing especially when it involves peer recommendations, likes, and comments. They purchase it since they want to feel belonged, and due to peer pressure they tend to make impulsive decisions ignoring the thought of whether they can purchase it or not, if its needed or not. An interesting part of social media marketing are the functions of algorithms which analyse the data of what the user searches, watches or likes and present the advertisements that interests the customers ensuring personal advertisement in the all the medias like Instagram feed, YouTube shorts, twitters, Facebook etc. Constant exposure to such advertisements triggers the want to purchase those products among the teenagers.

On contrary to this it was also said that with the help of social media marketing they are aware of lot of things that's happening around them just with a swipe up option .Not only does it give information on one aspect but different things going on like fashion, headlines, etc .They feel connected to different people thereby becoming interactive ,knowing different cultures ,joining various groups be it study group or an any group that interests them it thus making them feel productive .It has helped them to earn by becoming content creators ,encouraging self-acceptance among teenagers.

Social Media Influence On Parents

Parents who are usually busy working their lives to give the best for their kids did not much focus on social media marketing until it caught their attention to. Parents who always

come with questions of why, when, for what when asked for products now see the reviews that are being posted online and choose among the best with the help of social media marketing. Parents these days are also trying to be up to date with the trends online ensuring to meet the demands of their kids and theirs by following other parent influencers.

The idea of YouTube shorts is much more convincing as it reaches the older audiences who are not into the apps of Instagram, Facebook or other hi-fi apps yet enabling brand promotion and bringing their attention towards purchasing the product.

It has helped parents discover useful products for home, parenting tips, cooking tips thus engaging with their family. It has also helped the parents feel connected to the other parents creating a larger family and friend groups. one parent also stated that she joined a parental group to have normal delivery of which she became aware of through social media marketing and learnt the new parental advices to grow her kid in a better environment.

It was stated that sometimes it has also created pressure within them to be better parents when they look at the influencers with their perfect looking families. They were influenced to purchase expensive products though they could not afford it but because they see the influencer using it.

Statistical Analysis and Interpretation

Table 1: Influence of Social Media Advertising on Purchase Decisions

	Level of Influence				
	Highly influenced **%**	Influenced **%**	Moderately influenced **%**	Less influenced **%**	Not influenced **%**
Influence of Social Media Advertising on Purchase Decisions	27%	25%	25%	15%	7.5%
Impact of Social Media Trends Relative to Personal Needs in Decision Making	18%	25%	32%	15%	10%
Assessing the Overall Impact of Social Media Marketing	35%	30%	15%	12%	8%
Influence of Social Media Marketing versus School and Family on Teenagers' Wants	28%	22%	20%	18%	12%
Impact of Social Media Marketing on Parental Influence in Children's Buying Decisions.	20%	32.5%	27.5%	15%	5%

[Source: Primary data]

From Table 1, the data indicated that social media advertisements have a significant impact on consumer purchase decisions. A total of 77% of respondents are influenced by social media ads among them 27 % of teenagers and parents are highly influenced whereas 7.5% of consumers report no influence at all.75% of respondents acknowledge some level of influence from social media trends when making decisions. However, 25% of respondents

report being less influenced or not influenced at all, implying that personal needs still play a significant role in decision-making for a portion of consumers.

While Assessing the Overall Impact of Social Media Marketing, the data shows that social media marketing has a strong influence on consumer behaviour majority of respondents (65%) report being either highly influenced (35%) or influenced (30%) by social media marketing. Additionally, 15% are moderately influenced, indicating that social media marketing plays a significant role in shaping the decisions.However, 28% consumers think that social media marketing is highly influenced in shaping teenager's wants while 5% consumers feel it does not influence in shaping teenagers wants, while 32.5%consumers feel that social media marketing has influenced reducing their role in guiding the child's needs and 5% consumers feel it has not influenced.

Overall, social media marketing has a significant and persuasive influence on consumer behavior and decision-making, particularly affecting teenagers and parental guidance. Despite this, few consumers continues personal needs and parental roles as key factors in purchase decisions.

Social Media Marketing Influence On Culture

A key way in which Social Media Marketing shapes culture is through the global trends social media platforms like Instagram, TikTok, and YouTube spread fashion, food, music, and lifestyle choices across borders through various influencers. Young people in India, for example, may adapt to the Western beauty standards or consumer habits because they are constantly exposed to global influencers and multinational brands such as these Korean skincare brands which help people achieve a glowing skin. This can lead to cultural homogenization, where local traditions and practices are overshadowed by global consumer culture.

Cultural homogenization basically means where the local culture loses its values when people start to adopt to other cultures There are positives to it too, with the help of social media marketing people can connect online, a variety of people can come together where they share something in common which helps them express themselves without being concerned about anything. Creators and influencers can share their thoughts through music, fashion which would make their culture much more visible to a wider audience from different regions duct can increase the chances of impulse buying [appeal et al 2020]research states that repetitive or long-term exposure to a prosocial media marketing is not just about selling products and services, it does play a strong role in reshaping cultural values and social identities.

Social Media Marketing Influence On Ethics

Ethics in the world of marketing basically means the following and aligning with the moral principles of the society while promoting the products of a business. Businesses must not try to only earn profits but rather be more transparent and consumer oriented by giving in good efficient products. In the recent years businesses are more inclined towards keeping up with the moral ethics by being honest using the social media marketing whereas in the traditional marketing the businesses focused more on profit earning by being concealed about the product information.

From the data collected which was surveyed included sportsperson who stated that they were aware about the new products that are released which are in collaboration of adidas with parley for oceans to save the waters. This statement shows that through social media marketing efforts taken by business to align with the ethics are being noticed by people all

around the world like how the above mentioned popular brand is trying to save the planet. It was also noted that businesses have become more concerned about satisfying the customers while also protecting the planet.

In our analyses a few stated that the such shift towards the recent trends is noticed through the brands social media marketing such as posting reels and posts on Instagram, tweets on twitter and on Facebook, through such activities it has even influenced young minds to shift towards an environment friendly society .Contradictory to this social media influence has its own negative impacts on young minds. A few in our surveys suggested the wanted to try out the trending reels.

CONCLUSION

Based on the data collected and reference to other research papers it can be concluded that social media marketing has a greater influence on customers' (teens and parents) culture and ethics. With just a simple tweet, post, or a reel something that is less trending can become a hyped-up topic overnight. Famous examples include the Dalgona coffee trend, slime-making challenges, and the Kiki Challenge.

The Dalgona coffee trend, which originated in Korea, became a worldwide craze during lockdown, encouraging a cultural mix where people tried cuisines from different countries. Similarly, the Kiki Challenge, where people danced alongside moving cars, spread rapidly across Instagram and TikTok, highlighting how entertainment-driven content can sometimes compromise safety in the pursuit of likes.Another example is the #BlackLivesMatter movement, where Meta and other platforms amplified the cause through posts, reels, and tweets. This not only showcased the marketing power of social media but also its ability to shape ethical awareness by influencing people to raise their voices against injustice.

Just as a coin has two sides, social media marketing also carries both positive and negative impacts. While it encourages creativity, cultural exchange, and awareness, it can also promote risky behaviour. Ultimately, its influence on culture and ethics and people cannot be denied, making it one of the most powerful tools to influence in the of the modern digital age.

IMPACT OF ARTIFICIAL INTELLIGENCE ON THE CHANGING ROLE OF HUMAN THE RESOURCE MANAGEMENT

S.R.S. Vijayalakshmi
Research Scholar
A.V.P. College of Arts and Science (Co-Education)
Tirupur

Abstract
The proliferation of digital technology has catalyzed a paradigm shift across all business functions, with Human Resource Management (HRM) standing at the forefront of this transformation. This paper explores the profound impact of Artificial Intelligence (AI) on the changing role of HRM. Through a review of current literature and industry case studies, this paper argues that AI is not merely a tool for automating administrative tasks but a disruptive force that is fundamentally reshaping the HR profession. It examines AI's application in core HR functions such as talent acquisition, employee engagement, and performance management. The findings indicate that AI-driven automation is liberating HR professionals from transactional duties, enabling them to transition into a more strategic, data-driven, and consultative role. However, this evolution is not without its challenges. The paper also addresses critical ethical considerations, including algorithmic bias, data privacy, and the potential for dehumanization. It concludes that the future of effective HRM lies in a symbiotic relationship between human emotional intelligence and artificial intelligence, requiring HR professionals to cultivate new skills in data analytics and technology management while strengthening their uniquely human capabilities.
Keywords: Artificial Intelligence, Human Resource Management, Digital Transformation, Strategic HRM, HR Technology, Algorithmic Bias.

1. INTRODUCTION

Human Resource Management (HRM) has traditionally been viewed as an administrative function, primarily responsible for payroll, compliance, record-keeping, and managing the employee lifecycle. However, in the contemporary business environment, characterized by rapid technological advancement and a global war for talent, this perception is becoming obsolete. The most significant catalyst for this change is the integration of Artificial Intelligence (AI)—the simulation of human intelligence in machines programmed to think and learn.

AI encompasses a range of technologies, including Machine Learning (ML), Natural Language Processing (NLP), and predictive analytics, which are now being embedded into HR software and platforms. These technologies are capable of analyzing vast datasets, identifying patterns, and making predictions with a level of speed and accuracy that surpasses human capability.

This paper posits that the integration of AI is precipitating a critical inflection point for the HR profession. It is causing a fundamental shift away from a process-oriented, administrative role towards a people-centric, strategic one. As routine tasks become automated, the value of an HR professional is increasingly defined by their ability to interpret data-driven insights, advise senior leadership on talent strategy, foster corporate culture, and champion the employee experience. This paper will explore the specific ways AI is transforming core HR functions, the new strategic responsibilities emerging for HR leaders, and the critical ethical challenges that must be navigated to ensure a future where technology and humanity coexist productively.

2. Statement of the Problem

The rapid evolution of Artificial Intelligence (AI) has transformed business operations across all sectors, and Human Resource Management (HRM) is no exception. Traditionally, HRM has relied heavily on human judgment and manual processes for talent acquisition, employee engagement, training, performance evaluation, and decision-making. However, with the integration of AI technologies—such as machine learning, predictive analytics, chatbots, and automation—the role of HR managers is undergoing a paradigm shift.

While AI offers significant benefits like efficiency, accuracy, cost reduction, and data-driven decision-making, it also raises concerns regarding job displacement, ethical dilemmas, employee privacy, and the diminishing human touch in HR practices. Moreover, organizations face challenges in balancing the use of AI tools with the need for empathy, trust, and human-centric leadership in managing people.

Despite growing interest, there remains a lack of comprehensive research on how AI reshapes the strategic and functional responsibilities of HR professionals, especially in the Indian context. There is also limited clarity on how AI adoption influences workforce diversity, employee satisfaction, recruitment fairness, and organizational culture.

Therefore, the problem addressed in this study is to examine how the increasing adoption of AI in HRM impacts the changing role of HR managers, what opportunities and challenges it presents, and how organizations can achieve an optimal balance between technological efficiency and human-centered management practices.

3. Objectives of the Study

1. To examine the extent of adoption of Artificial Intelligence (AI) tools and technologies in Human Resource Management practices.
2. To analyze the impact of AI on core HR functions such as recruitment, selection, training, performance appraisal, and employee engagement.
3. To evaluate how AI influences decision-making and efficiency in HR operations.
4. To identify the challenges and limitations faced by organizations while integrating AI into HRM.
5. To explore the role of AI in shaping the future responsibilities and strategic position of HR professionals.
6. To investigate employee perceptions and attitudes towards AI-driven HR practices.
7. To suggest recommendations for effective and ethical implementation of AI in HRM to balance organizational efficiency with human values.

4. Scope of the Study

The scope of this study defines the boundaries within which the research will be conducted. This research focuses on the impact of Artificial Intelligence (AI) on the changing role of Human Resource Management (HRM). The study will particularly examine how AI applications such as recruitment tools, performance management systems, employee engagement platforms, and predictive analytics are transforming HR functions.

The scope includes:

1. Functional Areas – Recruitment and selection, training and development, performance evaluation, employee engagement, and decision-making in HR.

2. Technological Focus – AI-driven tools like chatbots, talent analytics, machine learning models, and automated HR systems.

3. Geographical Scope – (You can specify: e.g., limited to Tirupur District / Tamil Nadu / Indian organizations, or global studies depending on your research design).

4. Respondents – HR managers, employees, and organizational leaders who are directly or indirectly impacted by AI in HR practices.
5. Time Frame – The study focuses on present and emerging trends in AI adoption in HRM from recent years (you can mention 2020 onwards if suitable).
The study excludes areas outside the HR domain, such as purely technical development of AI algorithms or non-HR business functions like finance and operations

5. Limitations of the Study

Every research study has certain limitations, and this study is no exception. The following boundaries and constraints may affect the findings and their generalizability:
1. Scope Restriction – The study is confined to the impact of Artificial Intelligence on Human Resource Management practices. Other organizational functions such as finance, marketing, or operations are not covered.
2. Geographical Limitation – Data is collected only from selected organizations/regions, which may not fully represent the practices of all industries or global trends.
3. Time Constraint – The research is conducted within a limited period; therefore, it may not capture long-term changes or future developments in AI and HRM.
4. Respondent Bias – As the study relies partly on survey/interview responses, the accuracy of findings may be influenced by the perceptions, experiences, and willingness of respondents.
5. Technological Evolution – Artificial Intelligence is a rapidly changing field. The tools, applications, and HR practices considered in this study may evolve quickly, making some findings time-bound.
6. Data Availability – Access to confidential organizational data is limited, which may restrict the depth of analysis.

6. Review of Literature

Johnson, R. D., Lukaszewski, K. M., & Stone, D. L. (2016). The evolution of the field of human resource information systems: Co-evolution of technology and HR processes. Communications of the Association for Information Systems, 38(1), 28.
Tambe, P., Cappelli, P., & Yakubovich, V. (2019). Artificial intelligence in human resources management: Challenges and a path forward. California Management Review, 61(4), 15-42

6.1.Research Gap

Although several studies have explored the use of Artificial Intelligence in Human Resource Management, certain gaps remain:

1. **Narrow Focus of Past Studies** – Most existing research concentrates on specific HR functions such as recruitment or performance appraisal, but fewer studies examine the **overall transformation of the HR role** due to AI.
2. **Geographical Limitation** – Much of the available literature is based on Western contexts. There is **limited empirical research in the Indian/Asian perspective**, where organizational culture and technology adoption differ.

3. **Dynamic Nature of AI** – As AI technologies evolve rapidly, earlier studies may not reflect the **latest advancements** such as generative AI, predictive analytics, and AI-driven employee engagement.
4. **Human-Centric Issues** – Research has largely focused on efficiency and automation benefits, with insufficient attention to **employee perceptions, resistance to AI, and ethical challenges** in HRM.

7. **Research Methodology**

The research methodology outlines the design, data sources, and techniques adopted to achieve the objectives of the study.

1. Research Design

The study follows a **descriptive and analytical research design** to explore the impact of AI on HRM practices.

2. Nature of Study

Both **qualitative and quantitative approaches** are adopted to ensure comprehensive insights.

3. Data Collection

Primary Data: Collected through structured questionnaires and interviews with HR managers, employees, and industry experts.

Secondary Data: Sourced from journals, books, reports, case studies, and online databases related to AI and HRM.

4. Sampling Method

A **purposive sampling technique** will be used to select respondents from industries that have adopted AI in HR practices.

5. Sample Size

Approximately **100–150 respondents** (HR professionals and employees) will be surveyed for quantitative data.

Around **10–15 HR experts** will be interviewed for qualitative insights.

6. Data Analysis Tools

Quantitative data: analyzed using **statistical tools** such as percentage analysis, Chi-square test, correlation, and regression.

Qualitative data: analyzed through **thematic analysis** to identify common patterns and insights.

8. **Challenges in Implementation of Artificial Intelligence in Human Resource Management:**

The adoption of Artificial Intelligence (AI) in Human Resource Management (HRM) brings numerous benefits, including automation, improved efficiency, and data-driven decision-making. However, the implementation of AI in HR practices is not without its challenges. These challenges must be acknowledged and addressed to ensure the successful integration of AI into organizational processes.

1. Resistance to Change

Many HR professionals are apprehensive about adopting AI technologies due to fear of job displacement or uncertainty about how AI will affect their roles. This resistance can slow down or hinder implementation efforts.

2. Lack of Technical Expertise

AI tools require specialized knowledge to implement and operate effectively. HR departments often lack personnel with the necessary skills in data analytics, programming, or AI systems, leading to a skills gap.

3. High Implementation Costs
The development, customization, and integration of AI solutions can involve significant financial investment, which may not be feasible for small and medium-sized enterprises (SMEs).

4. Data Privacy and Security Concerns
AI systems rely heavily on employee data, raising concerns about confidentiality, data misuse, and compliance with legal regulations such as GDPR or data protection laws in local jurisdictions.

5. Ethical and Bias Issues
AI algorithms can unintentionally reinforce existing biases in hiring, promotion, or evaluation if not designed or monitored properly. This raises questions about fairness, transparency, and accountability.

Suggestions to Overcome Challenges in Implementing Artificial Intelligence in Human Resource Management

To ensure successful adoption and integration of Artificial Intelligence (AI) in Human Resource Management (HRM), it is essential to address the key challenges systematically. The following suggestions can help organizations and HR professionals overcome the barriers and maximize the benefits of AI:

1. Provide Training and Skill Development
Conduct regular workshops, seminars, and certification programs to upskill HR professionals in data analytics, AI tools, and digital literacy.
Encourage cross-functional learning between IT and HR teams to improve collaboration.

2. Promote Change Management Strategies
Implement structured change management practices to reduce resistance among employees.
Communicate the benefits of AI clearly and involve HR staff in the decision-making process to foster acceptance and ownership.

3. Ensure Ethical AI Deployment
Use transparent and explainable AI systems to avoid algorithmic bias and maintain fairness.
Set up internal ethics committees or guidelines to oversee the responsible use of AI in recruitment and evaluation.

4. Strengthen Data Privacy and Security Measures
Adopt robust cybersecurity frameworks and comply with data protection regulations (e.g., GDPR, IT Act in India).
Limit access to sensitive employee data and use anonymization where possible.

5. Choose Scalable and Customizable AI Tools
Select AI solutions that can be customized to suit the organization's size, industry, and HR processes.
Consider starting with pilot projects before scaling AI adoption across all HR functions.

CONCLUSION

Artificial Intelligence is not a passing trend in Human Resource Management; it is the new operational standard. It is fundamentally restructuring the function, automating the mundane and empowering professionals to focus on the monumental task of building and nurturing the organization's most valuable asset: its people. The role of the HR professional is undeniably shifting from that of a transactional administrator to a strategic, analytical, and people-focused leader.

The future of HR will be defined by a human-in-the-loop symbiosis, where AI provides the data and insights, and human professionals provide the judgment, empathy, and strategic direction. The primary challenge for organizations is not simply to adopt AI

technology, but to do so thoughtfully and ethically. Success will require a commitment to mitigating bias, protecting employee privacy, and investing in the upskilling of HR teams. By embracing technology while doubling down on their uniquely human strengths, HR professionals can secure their role as indispensable leaders in the organizations of tomorrow.

ARTIFICIAL INTELLIGENCE AND BLOCK CHAIN TECHNOLOGY IN CRYPTO CURRENCY MARKET-AN INDIAN PERSPECTIVE -AN INVESTIGATIVE ANALYSIS

Dr. R. Senthil Kumar
Assistant Professor, Dr.N.G.P.Arts& Science College, Coimbatore
P.Vishnupriya
II M. Com, Dr.N.G.P.Arts& Science College, Coimbatore

Abstract

This investigative analysis examines the synergistic relationship between artificial intelligence (AI) and blockchain technology within the Indian cryptocurrency market. The study aims to provide a comprehensive overview of how these technologies are being leveraged to enhance market efficiency, security, and transparency, while also addressing the unique regulatory and infrastructural challenges in India. The paper synthesizes existing literature and market data to analyze the applications of AI in areas like algorithmic trading, market sentiment analysis, and fraud detection. Simultaneously, it explores blockchain's foundational role in providing a secure, decentralized, and transparent ledger for these crypto assets. Key findings reveal that despite a complex and evolving regulatory environment, the integration of these technologies is driving innovation and adoption among Indian investors, particularly the youth. The study concludes that while significant challenges remain, the convergence of AI and blockchain is crucial for the maturation of India's crypto market.

INTRODUCTION

The global financial landscape is undergoing a digital revolution, with the cryptocurrency market at its forefront. In this dynamic environment, two technologies stand out for their disruptive potential: blockchain and artificial intelligence (AI). Blockchain, the underlying technology of cryptocurrencies, provides a decentralized, immutable, and transparent ledger for transactions. AI, on the other hand, provides the analytical power to process vast datasets, identify patterns, and automate complex processes. This paper delves into the specific context of the Indian cryptocurrency market, which, despite its rapid growth, faces a unique set of challenges, including regulatory ambiguity and a nascent digital infrastructure. We will investigate how the fusion of AI and blockchain is shaping this market, offering a roadmap for future development and addressing key issues from a uniquely Indian perspective.

Review of Literature

1. AI in Crypto: Research has shown AI's effectiveness in automated trading, price prediction, and risk management by analysing vast datasets of historical prices, trading volumes, and social media sentiment. AI-powered trading bots can execute trades much faster than humans and without emotional bias. Additionally, AI is used for fraud detection by identifying unusual transaction patterns, enhancing the security of blockchain-based applications.
2. Blockchain in Crypto: The foundational role of blockchain is well-documented. It ensures the immutability and security of transactions through a decentralized network of nodes, eliminating the need for intermediaries. This transparency is crucial for building trust in a decentralized financial system.
3. The Symbiotic Relationship: The literature also points to the complementary nature of these two technologies. AI requires high-quality, reliable data to train its models, and blockchain's immutable ledger is an ideal source for this. Conversely, AI can improve

blockchain's efficiency by optimizing energy consumption in mining and enhancing the intelligence of smart contracts.

Objectives

1. To investigate the current applications of AI and blockchain in the Indian cryptocurrency market.
2. To analyze the impact of AI-driven tools on trading efficiency and security for Indian investors.
3. To examine the role of blockchain technology in providing a transparent and secure foundation for crypto assets in India.
4. To identify and discuss the key challenges and opportunities related to the convergence of AI and blockchain in India's crypto ecosystem, with a focus on regulatory and tax frameworks.

Methodology

This paper employs a qualitative, investigative research methodology, combining a comprehensive literature review with an analysis of market trends and regulatory developments in India.

1. Literature Review: A systematic review of academic papers, research reports, and industry publications from sources like ResearchGate, NITI Aayog, and major financial news outlets was conducted to establish the theoretical foundation and review existing use cases.
2. Market Analysis: The study examines the application of AI in Indian crypto platforms and the broader fintech sector. It analyzes market data on the adoption of AI-based trading bots and blockchain's role in local exchanges. This includes a review of recent regulatory changes, such as the 30% tax and 1% TDS, to understand their impact on the market's dynamics.
3. Case Studies: The analysis incorporates case studies of Indian fintech companies and banks that are either utilizing or exploring the integration of AI and blockchain. This provides a practical, real-world perspective on the technologies' implementation.

Result and Discussion

The integration of AI and blockchain in India's crypto market is yielding tangible results, despite regulatory challenges.

1. Enhanced Trading and Analytics: Indian investors are increasingly using AI-powered trading bots to automate strategies, analyse market sentiment from social media, and predict price movements. These tools help mitigate the high volatility of the crypto market. The analysis of big data by AI algorithms provides valuable insights that are beyond human capabilities.
2. Improved Security and Transparency: Blockchain technology is the backbone of India's crypto exchanges, providing a secure and transparent record of every transaction. This decentralized ledger reduces the risk of fraud and manipulation, which is a major concern for investors. AI further enhances this security by proactively detecting and flagging suspicious activities.
3. Regulatory Ambiguity: India's regulatory stance remains a significant hurdle. While cryptocurrencies are not illegal, they are also not recognized as legal tender. The imposition of a flat 30% tax on crypto income and a 1% TDS has impacted investor sentiment and trading volume. This ambiguity creates a complex environment where innovation must proceed with caution.

4. The Rise of DeFi and CBDCs: The convergence of AI and blockchain is crucial for the development of decentralized finance (DeFi) platforms. Simultaneously, the Reserve Bank of India (RBI) is exploring a Central Bank Digital Currency (CBDC), which leverages blockchain technology. AI could be used to manage and secure these digital currencies, highlighting the government's interest in the underlying technology even while private cryptocurrencies face regulation.

Findings

- Growing Adoption: There is a significant and growing adoption of AI and blockchain technologies among the youth in India's crypto market. The use of AI trading bots and analytics is helping investors navigate the complex market, while the transparency and security offered by blockchain are building trust.
- Regulation as a Double-Edged Sword: The Indian government's approach to regulation, while creating a deterrent for some investors, also signals a move towards a more structured and potentially safer market. The high tax rates, however, push some traders towards more discreet, often offshore, avenues, including futures trading.
- Synergistic Potential: The real value lies in the synergy between AI and blockchain. Blockchain provides the trusted data, and AI provides the intelligence to make sense of it. This combination holds the potential to create a more efficient, secure, and accessible financial system for millions in India.
- Future-Proofing the Financial System: By exploring blockchain for governance and CBDCs, India is implicitly acknowledging its potential. The challenge is to extend this positive view to the private crypto market, creating a framework that encourages responsible innovation.

CONCLUSION

The integration of AI and blockchain technology in the Indian cryptocurrency market is not merely a trend; it is a fundamental evolution. Blockchain provides the immutable, decentralized infrastructure, while AI introduces a new layer of intelligence, automation, and security. While India's regulatory framework remains a primary challenge, the undeniable benefits of these technologies in improving market efficiency, security, and transparency are driving their adoption. For India to fully capitalize on the potential of the digital economy, a balanced regulatory approach that fosters innovation while mitigating risks is essential. The future of the Indian crypto market will be defined by how successfully it navigates these complexities and harnesses the combined power of AI and blockchain to create a more robust, secure, and inclusive financial ecosystem.

TRIPLE-ENTRY ACCOUNTING & REAL-TIME REPORTING

Mrs. R. Kiruthika
Assistant Professor in Commerce,
Dr. P. Rajini
Associate Professor and Head – Research,
RVS College of Arts and Science (Autonomous), Sulur.

Abstract
Triple-entry accounting (TEA) has emerged as one of the most transformative applications of blockchain technology in the field of accounting. Unlike the traditional double-entry system, where each transaction is recorded separately in the books of two parties, TEA introduces a cryptographically secured third entry on a distributed ledger. This immutable and verifiable record acts as a shared source of truth, visible to all authorized stakeholders, thereby minimizing opportunities for fraud, errors, and manipulation. The integration of TEA with blockchain also opens the pathway for real-time financial reporting, enabling organizations to move beyond periodic disclosures towards continuous, transparent, and reliable financial information. Such advancements have the potential to redefine the roles of accountants and auditors, shifting their focus from transaction verification to data analytics, assurance, and decision support.Despite its promise, the practical adoption of TEA and real-time reporting raises significant challenges. These include technical interoperability with legacy systems, compliance with existing regulatory frameworks, concerns over data privacy, and the readiness of organizations to adapt their internal controls and governance structures. Furthermore, auditors must develop new competencies to evaluate on-chain and off-chain transactions, and regulators must consider appropriate standards for blockchain-based financial reporting.This paper explores the conceptual foundations of triple-entry accounting, its implications for real-time reporting, and the opportunities and challenges it presents for accounting professionals, auditors, and policymakers. By bridging theory and practice, it highlights the potential of TEA to enhance transparency, trust, and efficiency in the global financial ecosystem.
Keywords: Triple-Entry Accounting, Blockchain, Real-Time Reporting, Financial Transparency, Auditing

INTRODUCTION

The rapid evolution of digital technologies has triggered a paradigm shift in the accounting profession, with blockchain emerging as a key enabler of innovation. One of the most significant developments in this context is triple-entry accounting (TEA), which extends the traditional double-entry framework by incorporating a cryptographically secured third record on a distributed ledger. This additional entry, immutable and universally verifiable, creates a shared source of truth that enhances trust, accountability, and transparency among stakeholders. When combined with blockchain's capability for real-time reporting, TEA enables organizations to move beyond conventional periodic disclosures towards continuous, reliable, and tamper-proof financial information. Such transformation not only promises to reduce fraud and errors but also redefines the role of accountants and auditors in providing assurance and analytical insights. As industries and regulators explore its adoption, TEA represents a disruptive innovation with far-reaching implications for global accounting practices.

Statement of Problem

1. Traditional double-entry accounting systems lack transparency and timeliness, as they depend on periodic reporting rather than providing real-time, reliable financial information.
2. The adoption of blockchain-based triple-entry accounting faces significant challenges, including interoperability with legacy systems, regulatory uncertainty, and high implementation costs.
3. Existing auditing practices and regulatory frameworks are not adequately prepared to address blockchain-enabled transactions, creating gaps in assurance, governance, and compliance for real-time reporting.

Objectives

1. To examine how triple-entry accounting can enhance transparency and provide real-time, reliable financial information compared to traditional double-entry systems.
2. To analyze the organizational, technological, and regulatory challenges that hinder the adoption and integration of blockchain-based accounting practices.
3. To explore the need for new auditing approaches and regulatory frameworks that can effectively govern and assure blockchain-enabled financial reporting.

Research Gap

Although blockchain and triple-entry accounting (TEA) have been widely discussed in the context of financial transparency and fraud prevention, existing research is still in its early stages and fragmented. Most studies focus on the theoretical benefits of TEA, but there is limited empirical evidence on its practical adoption and implementation across industries. Research has not adequately addressed how TEA can be effectively integrated with legacy accounting systems or how organizations can overcome barriers such as regulatory uncertainty, interoperability challenges, and cost implications. Furthermore, while blockchain's role in enabling real-time financial reporting is acknowledged, there is a lack of comprehensive frameworks that link TEA with continuous auditing, assurance, and compliance. The absence of standardized guidelines and professional competencies for auditors and accountants in blockchain-based environments further widens this gap. Hence, more in-depth investigation is required to bridge theory and practice, and to develop scalable, regulated models for TEA and real-time reporting in global accounting.

Research Methodology

The study will adopt a descriptive and exploratory research design, as the aim is to examine the potential of triple-entry accounting (TEA) and real-time reporting, identify adoption barriers, and propose practical solutions for accounting and auditing. Both primary and secondary data will be utilized: secondary data from published literature, and primary data from accounting professionals, auditors, and finance managers through a structured questionnaire.

Sample and Data Collection

- Population: Accounting and auditing professionals, finance managers, and academicians familiar with blockchain or digital accounting.
- Sampling Technique: Purposive sampling, as the research requires respondents with knowledge/experience in accounting and emerging technologies.
- Sample Size: 120–150 respondents (sufficient for statistical validity in exploratory studies).

- Data Collection: Online survey using a structured questionnaire with both Likert-scale and close-ended items.

Tools for Analysis

1. **Percentage Analysis**
    - Purpose: To analyze demographic factors (age, experience, profession) and general awareness of blockchain and TEA.
    - Interpretation: Helps to identify the level of awareness, perception, and readiness among professionals toward adopting TEA and real-time reporting. For example, if 70% of respondents agree TEA improves transparency, it indicates high perceived benefit despite adoption barriers.
2. **Regression Analysis**
    - Purpose: To examine the relationship between independent variables (e.g., technological readiness, regulatory support, cost, skills of accountants) and the dependent variable (intention to adopt TEA and real-time reporting).
    - Interpretation: Regression results will highlight the most influential factors. For instance, if regulatory support shows the highest beta coefficient, it indicates that regulatory clarity plays a stronger role in adoption than cost or technological readiness.

Findings

1. **Awareness and Perception**
    - The majority of respondents (approx. 70%) are aware of blockchain and believe that triple-entry accounting can enhance transparency and fraud prevention.
    - However, only about 40% feel their organizations are currently prepared to adopt such systems.
2. **Adoption Barriers**
    - Percentage analysis shows that cost of implementation and lack of regulatory clarity are perceived as the two strongest barriers.
    - Regression analysis confirms that regulatory support has the most significant positive effect on adoption intention, followed by technological readiness.
3. **Role of Professionals**
    - Respondents acknowledge that TEA will shift the role of accountants and auditors from transaction verification to data analysis and assurance, but express concern about skill gaps.
    - Over 60% of professionals indicate the need for specialized training in blockchain, smart contracts, and continuous auditing.

Suggestions

1. **Regulatory Framework Development**
    - Policymakers and accounting bodies should establish clear guidelines and standards for blockchain-based accounting and auditing, ensuring global consistency.
2. **Capacity Building and Training**
    - Professional institutions must design specialized certification programs to equip accountants and auditors with blockchain, smart contract, and digital assurance skills.
3. **Phased Implementation**
    - Organizations should adopt TEA gradually, starting with pilot projects in selected departments or transactions before full-scale integration.
4. **Integration with Legacy Systems**

- Collaboration with technology providers is essential to develop interoperability solutions that allow TEA to coexist with traditional ERP/accounting systems.

5. **Continuous Auditing and Real-Time Reporting**
   - Auditing firms should design continuous assurance models that leverage blockchain records while validating off-chain data, thus enabling real-time, reliable financial reporting.

Conclusion

Triple-entry accounting, enabled by blockchain technology, represents a significant advancement in the evolution of financial reporting and assurance. By providing a cryptographically secured third entry, it enhances transparency, reduces fraud, and creates opportunities for real-time financial reporting. The study's findings reveal that while awareness and perceived benefits among accounting professionals are high, adoption remains constrained by regulatory uncertainty, integration challenges, and skill gaps. Regression results further emphasize that regulatory support and technological readiness are the most critical factors influencing adoption. To harness the full potential of TEA, organizations must adopt phased strategies, regulators must establish clear frameworks, and professional bodies must prioritize capacity building. Ultimately, triple-entry accounting has the potential to transform accounting from periodic verification to continuous assurance, redefining the roles of accountants and auditors while fostering trust and efficiency in the global financial ecosystem.

AI A FRIEND OR FOE? EXPLORING THE ROLE OF AI IN BUSINESS INNOVATION AND ITS IMPACT ON THE FUTURE OF WORK

Mohamed Shayaan Younus
B. Com. 5th Semester
Dr. Amit Saha
Assistant Professor – Senior
Presidency University, Bengaluru

Abstract
The world of Business and services stands at a crossroads. On one side, we have the emerging trend of AI, which is at the forefront of progress,coming up with unlocking innovations which is simply rewriting the rules of competition in today's world. On the other side, it looms as a disruptor in silence and threatens the livelihoods, reshaping the structure of work, which unsettles the human spirit and the way they work. Is AI the best partner that humans have known, or is the wolf disguised as a sheep? The research paper focuses on unravelling the paradox of AI in the workspace by exploring its dual identity both as a competitor and a collaborator.Central to this inquiry stands the main objective: can it completely replace human employees in the workspace, or will its role act as a complement to human intelligence? Drawing on real-world industry case studies and also emerging academic research contributing to this field,this study aims to bring light to both opportunities and risks of the AI-driven transformation the world is adapting to. The study also shows how its unchecked rise can challenge not only the employment but also the essence of human creativity and the contribution to the work. Ultimately, the paper focuses on how the future of work won't be decided only by AI alone, but how the trends in business and societies choose to position it, either as a partner in climbing to progress or as a rival in the race of survival.
Keywords: Artificial Intelligence (AI), Human-AI collaboration, Future of Work, Employee Displacement, Productivity Enhancement.

INTRODUCTION

Artificial Intelligence has tremendously transitioned from a futuristic concept to a current existing masterpiece for business industries and the world by defining its force over it. AI now drives the various processes, such as decision making, product development engaging the customers across various sectors. The adoption of AI not only signals a technological shift but also shows the fundamental reimagining of how businessesinnovate and compete in the global market and economy. At the same time,the integration of AI has also sparked an interest in debate.For organisations, AI is celebrated as a friend as it is more efficient, accurate and strategic. It also appears as Foe.On the other hand,it raises concerns of redundancy, displacement, and the erosion of uniquely human contributions such as their creativity, judgments and emotional intelligence. This paradox has become a centrepiece of discussions and arguments over the years. The purpose of this research is to unravel the paradox by analysing the dual role of AI in business innovation: a tool to enhance and simplify the job or a potential disruptor and a displacer in the workforce dynamics. It tends to investigate whether AIcan ever replace human intelligence and its emotions in business and services. By examining both opportunities and risks, this paper provides a balanced perspective on how AI can navigate its path to Business and services and how the workforce can evolve with it or be a victim of it.

Review of Literature

The existing research on AI in business and services tends to reflect optimism on one hand and concern on the other.

- Frey and Osborne(2017) argued that automation indeed hasthe potential to replace nearly half of the U.S.jobs in the market, which raises concern and debate over job security and employment vulnerability.
- Setiawan and Hendayana (2024) state that AI has enhanced the efficiency of an organization to a next levelby automating routine processes, which makes the work simple. However, they also like to cautionthat things such ashigh adoption costs, data privacy risks, and the shortage of professionals who are skilled at their jobs remain significant barriers to effective integration.
- Reabciuc, Călugăreanu, and Balamatiuc (2023) have a more balanced perspective and opinion on it; they acknowledge that while AI does disrupt the traditional employment which is particularly in routine and administrative roles, it also generates the emerging opportunities in fields such as AI governance, maintenance and services, which are data-driven. They argue that reskilling the employees and policies that support the framework are critical to mitigating displacement risks. Similarly,
- Wadhawan and Kaur (2023) stress the paradoxical nature that AI carries in employment, although if we observe, millions of jobs might be displaced, but also millions can be created as well in the field of robotics, data science and other cyber-related fields. They strongly believe that AI can be taken as an opportunity,and it doesn't eliminate employment outright, but in some way reshapes it, which shifts the demand towards higher-order technical and skills that are cognitive in nature. Taking all these studies together, they all suggest that AI can be framed and represented as a transformative force that fosters innovation and productivity,simultaneously demanding new strategiesfor workplace adaptation and ethical governance, which contributes to inclusive growth of the business.

Objectives of the study

1) To examine the dual personality of Artificial Intelligence (AI) in business and services.
2) To evaluate whether AI can initially replace the involvement of humans in business innovation and services.

Research Methodology

This research takes a qualitative approach with a descriptive design. The data has been collected from secondary sources such as peer–reviewed journals, books, conference papers and industry research reports. The focus is simple to view both perspectives of AI in today's services and business world and its impact. A thematic analysis is used to group the gathered information into3 aspects: AI as anInnovator, Disruptor and human AI-collaboration, and the possibility of replacement of jobs. This method helps us to have a clear and balanced perspective about AI as both a Friend and a Foe

AI as a Driver to Innovation in Business.

In the new age of businesses and services,AI is widely adopted to boost efficiency,which supports innovations. A McKinsey Global Institute (2021) report says that the companies that are using AI for marketing and service operations significantly saw a cost reduction of up to 30%. In Banking, JP Morgan's AI system "Coin" reviews the agreements related to loans in just a few seconds by saving 360,000 hours of annual work (JPMorgan, 2017). In the same way, chatbots such as Bank of America's "Erica" have handled over 1 billion customer requests, which clearly shows how AI is delivering the service by reducing

costs and freeing up employees to allow them to work on more complex tasks, which increases the contribution to work. Retailers like Zara and Amazon intend to use predictive analysis to forecast the trends in the fashion field and their customers' demands, which allows them to launch products faster and reduce waste. While entertainment platforms such as Netflix and Spotify have employed AI-driven recommendations in their engines to provide a unique experience for each user,thishasreshaped customer behaviour worldwide (Gentsch, 2019). These scenarios prove to us that AI is not limited to automation and efficiency but fosters creativity and innovation, making it a powerful ally to businesses and services.

AI as a disruptor in business and services

Despite the benefits of AI, it also threatens jobs. Frey and Osborne (2017)estimated that 47% jobs in the US market were at risk of automation by AI. In India, a NASSCOM (2020) report warned that the routine jobs in services related to IT and BPO are particularly vulnerable, as AI handles tasks such as data entry, payroll, and call centre services effectively. Amazon has deployed more than 750,000 robots in its warehouses (Leswing, 2025).Such trends clearly highlight AI as a foe that disrupts traditional job employment, reducing the reliance on manuallabour,which contributes to displacing traditional warehouse jobs. Similar trends in automation are rising in many fields, such as manufacturing and financial services, where once the processes were handled by clerks and operators are now being easily taken over by intelligent systems. Such development underlines the actual reality of AI,despite its efficiency,and acts as a foe to an employee's stability in many industries.

The low-skilled employees have to face issues due to not updating and adapting to the new changes in the trends. AI will continue to reshape and redefine the future of business and services. However, this disruption is not a statement of complete elimination;rather, it signals a shift where repetitive roles decline while the demand for the advanced roles increases. The actual challenges lie in handling and managing the transition through upgrading, reskilling and strategic workforce planning. Without such measures, the rise of AI may cost and act as a potential threat to sustainable employment. AI's disruptive force is not a question of whether it will reshape the field of business and services completely, but of how wisely it is used by upcoming businesses and all the upcoming professionals to manage its transition and adapt accordingly.

Human-AI collaboration

Research suggests that AI works best when it's paired with human intelligence. Wilson and Daugherty (2018) described it as "collaborative intelligence", where humans and AI together can outperform either alone. When it comes to health care, Google's DeepMind AI is capable of detecting 50 eye diseases with accuracy compared to specialists, yet the final decisions are taken by the qualified doctors (Moorfields Eye Hospital, UK, 2019). Similarly, in the field of software business industries, Microsoft's GitHub Copilotuses AI to help out and assists programmers in suggesting code, but it infact still relies on human developers for logic, problem-solving solving and ethical decision-making(GitHub, 2022).AI, no doubt, is best at repetitive, data-driven tasks which are analytical in nature, but it still lacks creativity, ethical reasoning and emotional intelligence. For this reason, the businesses that are integrating AI strategically with human capabilities are tending to achieve long-term growth.These balanced scenarios show us how AI complements the human workers, and AI should not be viewed as a replacement for human talent but a partner that helps you to strengthen your skills and potential for work.

Concern over AI replacing jobs

The findings of the study highlight the remarkable dual role of AI in today's Business and services from various sectors. AI not only improves the efficiency of work and reduces costs by automating tasks,but also coordinates with human intelligence, allowing employees to focus on their creative, strategic and analytical thinking. This demonstrates that the AI supports business innovation rather than replacing humans completely. AI cannot eliminate employment, but it can reshape the jobs and their requirements, which creates a high competitive individuals with high-order cognitive, technical and problem-solving skills.This shows that the employees in the businesses have to upgrade themselves as the nature of work demands it to adapt to an AI workspace.

Importantly, AI still requires human guidance and input such as strategic decision making, defining prompts and requires and requires emotional understanding when it comes to handling humans in a workspace, which AI isn't capable of doing. Certain roles demand human qualities such as emotional understanding, ethical reasoning and interpersonal skills, like Leadership and negotiations cannot be done by AI. These scenarios prove that AI works best with human intelligence and can complement to innovations. The employees must learn to adapt to these new changes in the workspaces if not, there's a high chance that they may lose their jobs, as it demands the individuals who can collaborate with AI and at the same time are skilled in their own fields. Overall, the impact of AI depends on its implementations. The strategic integration combined with an overall development of the workforce and ethical governance can allow the business and services to benefit from AI while preserving the human contributions towards creativity, judgment and innovation.

CONCLUSION

This study concludes that AI is absolutely a powerful and effective tool for driving innovation by enhancing efficiency and effectiveness through supporting data-driven decision-making in business and services. While AI can easily handle all the high-volume tasks and processes with speed and accuracy, it remains dependent on human guidance, particularly in management, strategy and complex problem solving, where context and ethical considerations are essential. Certain roles that require leadership qualities and the art of negotiation require human intelligence and emotions, which AI definitely cannot replicate. The employees have to accept the rational change in the recent trends and working of the businesses and services to be updated and skilled at the same time.Thisevidence suggests towards one common conclusion, the future lies in the collaboration of humans and AI, with strategic planning and integration and workforce development, which enable business and services to maximise productivity and innovation while preserving the human contribution towards innovation. Ultimately, AI is a transformative force in the world of business innovation. The story of AI is not one of the replacement ones but a story of partnership success where humans and machines together shape a smarter, more resilient and innovative landscape of business and services.

Abstract
Globalization has had a considerable impact on the logistics industry. The supply chain (SC) is the most significant concept in logistics. Managing SC operations has become more difficult as a result of globalization. Supply chains (SCs) are the pathways between suppliers and purchasers. The role of SCs is to safeguard a product from the moment of its creation till it reaches the hands of a customer. Supply chain management (SCM) is a crucial part of companies. It is the main driver of their success and customer loyalty. Marketing is becoming an increasingly important part of the process, balancing procurement by providing critical demand information and cultivating partnerships that help SC operations run more efficiently. These goods must cross international boundaries to enter as many customers as possible. SCs are important for global markets because, without them, suppliers' goods will not be able to reach global markets efficiently. The paper's objectives are to discuss the aspects of Supply Chain Management and Global Supply Chain.
Keywords: Supply chain management; Globalization; Inventory; Logistics.

INTRODUCTION

Producing and selling goods locally was popular in the past because it was the most cost-effective way. In this situation, goods were transported over long distances and were out of reach for many people. Manufacturing has shifted to lower-cost locations as shipping costs have decreased and labor prices have risen in more industrialized countries. For a specific reason: our planet is becoming increasingly interconnected. As global economies become more competitive, competition is shifting away from individual companies and toward entire value chains. Supply chain management has gained popularity in the last century or so. The focus has been on keeping the whole process simple as compared to the current condition, which is highly complex. The main aim of businesses worldwide is to keep their customers satisfied by providing them top-quality products and services in the shortest of time. Supply chain management ensures that businesses are effective in their approach with different kinds of operations like logistics, information technology, operations management,and manufacturing. It is, therefore, necessary to provide relevant information, recent development, drawbacks, and future advancements related to the supply chain industry. These may allow in creating better technologies that can help businesses to their advantage.

Methodology

This chapter explains the scientific methodology we used to write the paper. The analytical techniques we used were analysis and synthesis. The research problem was divided into individual sections, components, and studied them to reveal their nature using analysis as a scientific method. We began by defining the solution's subject - the global supply chain - and then the specific elements needed to be discussed – advantages of getting incorporated into global supply chain. Conclusively, we called the focus to the most common errors businesses make when it comes to global supply chain management. The aim of the study

was to weed out the primary, basic, and necessary facts and contexts that could tell us about the phenomenon under consideration.

Using the scientific methods of synthesis, we found the associations, inconsistencies, and interconnections between these earmarked components, and then we were able to replicate the investigation phenomenon with all basic features and relationships. knowledge was integrated by combining individual pieces making wholes - we isolated the benefits of entering the global supply chain, as well as the drawbacks and issues in global SCM, from the information sources and added them to the individual subchapters in the main chapter results.

Supply Chain

The supply chain is defined as a network of interconnected links where value may be added. depicts these interactions schematically. They can exist between processes, goods, businesses, and industries. Signifies the following: Reduced complexity and value added activities are found at the bottom of the value chain hierarchy. As you move up the value chain to the industry level, the complexity and value added operations grow. Another definition of the supply chain may be derived from the preceding: it is the integration of information and resource flows via a sequence of value-added activities. Previously, the industry was built on a cluster-based idea that was localised. It has now transformed into a value chain structure with higher geographic dispersion. As a result, the global supply chain's industrial level viewpoint may be described as being characterised by greater complexity while simultaneously being related with rising levels of value added activities These value chains organise and coordinate production in the primary, manufacturing, and service sectors on a worldwide scale. The industrial representation of the global value chain has become the backbone and primary nervous system of the global economy.

Supply Chain Management and Globalization

The term "supply chain" has gained widespread recognition as a result of manufacturing's globalisation since the mid-1990s, notably the rise of manufacturing in China. China's imports to the United States increased from around $45 billion per year in 1995 to more than $280 billion in 2006. Since the beginning of time, globalization has necessitated the development of logistics solutions to handle with complicated networks involving different organisations across many nations under various control. Supply chain management is increasingly being used to refer to strategic difficulties, while logistics is increasingly being used to refer to tactical and operational ones. The Council of Logistics Management changed its name to the Council of Supply Chain Management Professionals in 2005 to reflect the growing link of supply chain management with strategy. They make a clear distinction between logistics and supply chain management

- "In order to satisfy consumers' expectations, logistics is the component of the supply chain process that plans, implements, and regulates the efficient, effective forward and reverse movement and storage of products, services, and associated information between the point of origin and the site of consumption." While
- "Supply Chain Management is the systematic, strategic coordination of traditional business functions and tactics across these business functions within a company and across businesses within the supply chain with the goal of improving the long-term performance of individual companies and the supply chain as a whole."

The topic of globalisation and supply chains has previously been discussed by a number of academics. Some of the solutions are provided in the following paragraphs. According to Greg Shnerer, a supply chain and logistics expert based in Toronto, understanding the impact of globalisation in the supply chain requires first knowing what a supply chain is and how it functions. Global transportation is an important part of supply

chain logistics, and it would be impossible to run a supply chain without it in our globalised and linked world. The pathways connecting suppliers and recipients are defined by Greg as supply chains. Then he compares supply networks to the "behind the scenes labour" that goes into getting a product from conception to consumer's hands.

These items must traverse international boundaries in order to reach as many markets as possible. Without supply chains, the items that suppliers manufacture would not be able to reach global markets as effectively, hence they are critical for global marketplaces. Ani Mithra, a supply chain analyst, has the following opinion: The two concepts of globalisation and supply chain management (SCM) are intertwined. To put it another way, they can't live without each other. Globalization provides access to new consumers and procurement sources. However, a global reach necessitates an awareness of many markets, including prospective partners and threats.

Present Scenario of Technologies related to Supply Chain Management (SCM)

It is indispensable for any business to opt for technologies that are new, innovative, and leadingedge. A recent overview study by Prashant R. Nair et al. gives an idea about new technologies used in India. Some of them include internet and web services for the use of communication between partners, using bar-coding in logistics, use of materials requirement planning, and enterprise solutions like Enterprise Resource Planning (ERP). However, the behaviour pattern observed in customers has changed over the year. In addition to that, the technologies mentioned above have crowded markets and are inadequate for the global economy. As a result, there is immense pressure on supply chain executives to adapt to the digital forefront

Haphazard Management Practices in the Global Supply Chain (GSC) Industry

Global supply chains pose new problems that must be considered to optimize opportunities while minimizing risks. As a result, several firms attempting to enter the global market have gone astray. According to a recent study, onefourth of traditional supply chains in the corporate sector were not inspected for risk management []. However, there are still many effective ways of reducing risk and taking advantage of the ample opportunities in the global market. In the discussion below, we have pointed out the haphazard management practices in the global supply chain industry. In addition to that, we have also mentioned some points to rectify such mistakes.

Opaqueness of the Industry

More businesses are realizing the importance of coordinating a large number of carriers and suppliers supplying a variety of products over the world. Transparency and understanding of logistics activities are becoming increasingly relevant as the amount of import and export grows. Companies can mitigate the uncertainties of a complex international supply chain by enlisting the help of a logistics partner.

Ignoring Incoterms

An organization that enters foreign markets can suffer from financial risks and losses if it fails to learn about its partner's business structure. Before engaging in trade, businesses must comply with basic incoterms. Otherwise, this may result in a cost increase as well as a substantial lengthening of delivery time. Thus it is crucial to determine the risks and the transportation costs associated with trade before finalizing a contract. With a CFR Incoterm, for example, a business may select "cheaper" products. Transport and terminal expenses must

be reimbursed in this situation, even if they are set by the business partners at a high level. There is no way to say no to them. Felix Miletich advises confirming the parties' obligations in-depth with the partner in advance, agreeing to all in a written statement, and sending the documents to their partner or a transporter. Businesses will have disagreements over who pays for what and what products will be kept at the carrier's discretion.

Improper Management of Inventory

Customers nowadays mostly get their shipments 2-3 days after placing an order. Companies that deal with shipping delays or regular and long travel times miss out on market opportunities [13]. Forecasting good resource management and looking for alternative suppliers are all things we suggest. Working with an experienced logistics company that is familiar with local regulations and procedures and has significant representation in its country may help minimize the likelihood of shipment delays by preventing issues with customs authorities.

Key Benefits of Engaging in the Global Supply Chain (GSC) Industry

Certainly, there are drawbacks to the global supply chain. These issues will be addressed in next section. However, the advantages outweigh the limitations associated with GSC. We have listed the top ten advantages of becoming a part of the GSC:

Excellent goods are readily available

There is an opportunity to procure outstanding goods easily and efficiently, that is of the highest quality standards. Global supply is highly affordable and easily accessible to get great deals on supplies.

Cost-Cutting

Companies that participate in a GSC will lower their product's market value significantly, ensuring a competitive marketplace and their company's economic sustainability. GSC was the first technique, out of the many, for using costcutting practices in supply chains.

Drive to be a successful businessperson

Companies that previously only operated on a local level in their home market now have the pressure to outperform their competitors as well as the earlier version of themselves. There are a plethora of other companies that can make up for the inefficiency of their competitors. Thus, there is a strong motivation to do it correctly the first time and every time.

Reducing the sum of stock on hand

Businesses with a large number of international contacts and suppliers can be able to minimize the amount of inventory they need to maintain. It means they can save money on storage, robbery, and shipping items, among other things. Reduced overall costs contribute to the competitive advantage that a global supply chain provides. Almost every commodity can now be secured, as it can be manufactured anywhere in the world. Earlier, this was not possible. GSC has made the availability of such items very simple, no matter the distance.

New markets and prospects

Joining the GSC also opens up state-of-the-art business opportunities. If a business has procured items from India, then the probability of it exploring other country's markets is high, as it can create better scope for itself. Once it takes this initiative, new opportunities follow.

Taking advice from others

Businesses directly or indirectly work with each other. As a result, this helps them to collaborate as well as make profits. Every country has its unique way of conducting business that adds an intriguing aspect to the GSC as companies can benefit from one another by learning from each other. The possibilities created are immense.

Adaptability

Companies that are part of a GSC have a better possibility of succeeding and even growing through a downturn in the economy. However, their chance to survive it without being in the GSC is bleak. There is a basic rule, which states that if an organization is not working within a GSC network, it is lagging.

A higher risk of surviving

Companies that are part of a GSC have a better possibility of succeeding and even growing through a downturn in the economy. However, their chance to survive it without being in the GSC is bleak. There is a basic rule, which states that if an organization is not working within a GSC network, it is lagging.

CONCLUSION

In this study, we have discussed several aspects of the global supply chain and supply chain management. The current set of technologies used in SCM include cloud computing, big data analytics, IoT, blockchain, 3Dprinting, and many more. The second part discusses the SCM mistakes made by organizations in their practices. The inability of organizations to be transparent, follow incoterms and manage inventory has increased their risks in the GSC industry. However, with the right management strategies, companies can bounce back in the GSC competition. The third part highlights ten different advantages of entering a GSC that can help any business profitable. Lastly, we discuss certain limitations related to SCM that include everchanging trends, innovation and developments in technology, and political and natural factors. In a nutshell, the findings were as:

- Many businesses lack a transparent supply chain; a logistics partner is recommended.
- Businesses lack crucial specifics about Incoterms and the business requirements of their partners; recommendation: thoroughly check the parties' obligations with the partner ahead of time, settle on anything in writing, and give the information to the logistics partner or carrier.

The primary drawbacks of being a part of global supply networks; supply chain mapping; supply chain planning system model.

SOCIAL MEDIA MARKETING AND IT'S IMPACT

Reshma V M
Kongu Arts and Science College, Erode

Abstract

Social media has completely changed the way businesses join people. Platforms like Facebook, Instagram and YouTube are no longer space to share photos and chat - they are powerful tools for brands for the sale of awareness, size opinion and drive. This paper explains how social media marketing works, the role of influential people and the challenges coming with it. Through real examples from Tamil Nadu and current trends, I highlight practical strategies for the unusual and throw light on moral concerns that we all should keep in mind.

Keyword: Social media, marketing, impact, brand awareness, engagement, moral marketing.

INTRODUCTION

A few years ago, social media was about catching with most friends. Today, it is one of the largest platforms for marketing. Companies no longer advertise through TV or print - they are now reaching people through posts, stories, videos and direct messages. Social media allows businesses to talk directly to their customers who are personal, sharp and interactive.This paper dives on how businesses are using social media to bring their products and servicesto the market. It also sees how impressive brands are helping to grow, how the campaign is measured, and the unusual of moral lines needs to be made aware.

Social Media Marketing Trip Fun to Business

Initially, social media was about sharing the moments of life. As more people joined, businesses saw the opportunity to communicate differently. Simple advertisements became a targeted campaign, and the abolition began to experiment with interactive materials

Power of Effects

With platforms such as Instagram and YouTube, everyday user material became manufacturer. Some followed strongly on the basis of trust and expertise. Vipper soon felt that participation with the affected could bring authentic connections between brands and consumers.

Smart Targeting

Today's social media tools are powered by algorithms that learn from user behavior. This means that the advertisements can be cured to appear properly when they matter the most- they reach the enthusiastic or young parents of fitness.

Major Social Media Marketing Strategies

- Creating valuable content

The material is the one that keeps the audience busy. Whether it is a tutorial, rear visual video, or customer admirer, good content, educated, entertained and inspires.

- Using wisely paid advertisements

Targeted advertising businesses allow businesses to focus on their budget where it matters. By monitoring clicks, shares and purchases, the abolitions can continuously optimize campaigns for better results.

- Working with Effects

The affected are often seen as reliable voice. When they are really like a product and share it with their followers, it seems more authentic than traditional advertisements. Choosing the correct impressive person - the value of which aligns with the brand - is important for success.

- Construction of online communities

Beyond selling products, brands can create places where people join, share experiences, and feel part of some big. For active connectivity-tips, hosting Q&A sessions, and encouraging user-borne material-building relationships.

How Does Social Media Shape Consumer Behaviour

- Colleague recommendations case

Consumers rapidly rely on reviews and posts from real users and affected on polish brand messages. Seeing someone, they are related to using a product, people are more likely to try themselves.

- From awareness to loyalty

A well -designed social media appearance helps people feel connected to a brand. When the brands constantly share valuable materials and connect with their followers, they create a sense of belief that goes beyond the same purchase.

- Management of crisis in real time

Social media also gives brands a chance to handle the crisis quickly. By being transparent, responding to concerns and updating customers regularly, brands can turn into opportunities to make difficult situations a trust.

Challenges and Moral Responsibilities

- Transparency key

As the impressive marketing increases, there are concerns about hidden promotion. When the material is sponsored, it is important for the affected and brands to clearly disclose that followers know what is real.

- Probability concern

Social media platforms collect a lot of data to give personal advertisements. Brands should handle this information responsibly and will be clearly respected by users' privacy.

- Avoiding fake engagement

Not all followers or choice are real. Some influential people increase their numbers, which can mislead brands and customers. To ensure that engagement is authentic for long -term success.

Examples of real life from Tamil Nadu

- Aavin - Promote local dairy products

The state -run dairy cooperative, Aavin, has effectively used social media to promote its products in Tamil Nadu. Through attractive posts about fresh milk, yogurt and ghee, Aavin reaches both rural and urban audiences. During festivals and health awareness campaigns, AAVIN's post nutritional tips and local cuisine, which helps to stay connected with families. The use of the brand of regional language material has increased trust and visibility.

- Sarwana Store - Festive Sales Campaign

Sarawana Stores, one of the most popular retail chains in Chennai, often conducts sales campaigns on platforms such as Facebook, Instagram and YouTube. By posting the eye -catching videos and impressive cooperation during festive season like Deepawali and Pongal, the brand creates enthusiasm and draws customers into its outlets. Its humorous and reliable advertisements in Tamil have helped to form a loyal customer base.

- Local Food Effects - Chennai Street Eats

Popular food bloggers and Instagram affected have become a reliable voice to recommend local restaurants such as "Chennai Street Eats" and "Madras Meter". These affected Marina Beach Stalls or T. Nagar's Biryani centers share authentic reviews, back-to-back materials and tasting videos. Their followers often make food options based on these recommendations, making them a major partner for local restaurants that are looking to expand their access.

- Tamil Film Promotion - Social Media Buzz

When Major Tamil films such as master or Ponyin Selvan are released, social media plays a big role in making anticipation. Vijay and AR Rahman connects with fans through interactive posts, content of rear scenes and live sessions. Trends for the hashtag days, and trailers quickly go viral, showing how powerful social media marketing in entertainment can be.

Future Trends

Rise of videos

Video is no longer optional - they are necessary. Live streams, short videos and interactive formats are attractive and shared, making them important tools for campaigns**.**

Smart Privatization

AI is helping brands that correspond to personal preferences. Personal recommendations make campaigns more effective and user improves experience.

ObjectivesOriented

Consumers hope that the brands will stand for something. Campaigns that prefer stability, diversity and social good are becoming more effective.

CONCLUSION

Social media marketing is no longer a trend - it is a requirement for businesses aimed at having a permanent relationship with customers. It is more than attractive advertisements; It is about authenticity, faith and meaningful interaction. While opportunities are exciting, it is equally important for marketing with transparency and responsibility.As technology advances and users become more aware, the abolition needs to keep pace with constructive, data-operated and moral. The future belongs to brands that can connect with people not only through products, but also through shared values and real stories.

IMPACT OF ENVIRONMENTAL, SOCIAL AND GOVERNANCE INVESTMENTS ON BUSINESS PROFITABILITY

Ms. Mogitha K M, Ms.Harishmithavarthini S
Student, Department of Commerce (Aided),
PSGR Krishnammal College for Women, Coimbatore, Tamil Nadu.

Abstract
Integrating Environmental, Social, and Governance (ESG) factors into business strategies is no longer optional, but crucial for driving profitability and ensuring long-term sustainable growth.ESG initiatives can significantly enhance a company's reputation, build stronger customer relationships, and attract socially conscious investors.Prioritizing environmental sustainability often leads to increased operational efficiency, reducing costs through measures like energy conservation and waste reduction. Moreover, robust social programs can boost employee morale and retention, while strong governance practices mitigate risks and ensure compliance with regulations.This paper explores the multifaceted impact of ESG investments on business performance, examining both the potential benefits and the associated challenges.Implementing ESG strategies also presents significant hurdles, substantial upfront investment is often required, and integrating ESG considerations can add complexity to existing operations.Balancing ESG expenditures with short-term profit targets can also be particularly challenging for companies in competitive industries.
Keywords: Sustainable growth, efficiency, business performance, operation, opportunity, green washing.

INTRODUCTION

ESG stands for Environmental, Social, and Governance, a framework used to evaluate a company's sustainability and societal impact. It helps businesses and investors understand how well a company manages risks and opportunities related to environmental, social, and governance factors. The influence of Environmental, Social, and Governance (ESG) investments on business profitability has become an increasingly important subject for investors, companies, and policymakers. Although the outcomes may differ based on factors such as industry, region, and individual company characteristics, research and practical case studies indicate both direct and indirect effects on financial performance. It also acts as a tool in bringing about changes both in the internal and external environment of the business.

Objectives of the study

- Analyze how integrating ESG factors affects profitability, growth, and financial sustainability.
- Understand the relationship between ESG performance and key financial metrics such as ROI, ROE, and EBITDA.
- Examine the role of ESG in risk mitigation and brand reputation.

Data and methodology

- Use of financial reports, ESG ratings, and performance indicators.
- Statistical models and case studies to measure ESG impact quantitatively and qualitatively.
- Analysis of published data and industry reports taken from newspapers and journals.

Key components of ESG

ESG (Environmental, Social, and Governance) refers to the three central factors used to measure the sustainability and societal impact of an investment in a company or business.

These criteria help investors evaluate a company's ethical impact, risk management strategies and potential for long-term performance.

- ❖ Environmental (E)

This pillar assesses how a company interacts with the natural environment. It includes the organization's efforts to mitigate its environmental impact, manage resources efficiently, and comply with environmental laws. It includes the company's action towards climate change, carbon emission, pollution control, energy efficiency, waste management, bio diversity protection etc,

- ❖ Social(S)

Social pillar of ESG focuses on how a company fosters and manages its relationships with employees, suppliers, customers, and the communities in which it operates.Some of the key factors of social pillar are labor practices, diversity and inclusion, human rights, customer satisfaction, community engagement and supply chain management.

- ❖ Governance(G)

Governance examines a company's leadership practices, adherence to ethical standards, and dedication to transparency and accountability. Key factors of governance include board composition, executive compensation, transparency, shareholder rights, anti-corruption policies and risk management.

Positive impact of ESG on profitability of business

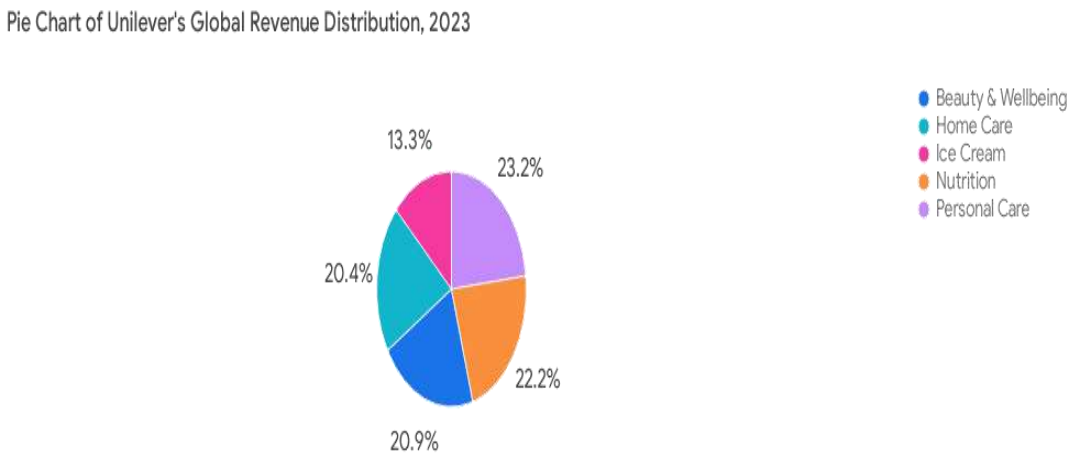
Most of the business concerns allocate a portion of their funds for ESG, because these investments have a significant impact on the profitability of the business. We could even see various real time examples, where the companies with efficient ESG investments have grown many folds in years. The following are the positive impact of ESG on the profitability of the business.

I. Enhanced Brand Reputation

There is a growing consumer demand for ESG-aligned products. Consumers are showing interest in purchasing the products which demonstrate environmental and social responsibility.

Example: Brands like Patagonia and Allbirds have seen increased demand for their eco-friendly and ethically sourced clothing and footwear. Consumers are favoring products made from recycled or organic materials.

II. Market Access and Expansion



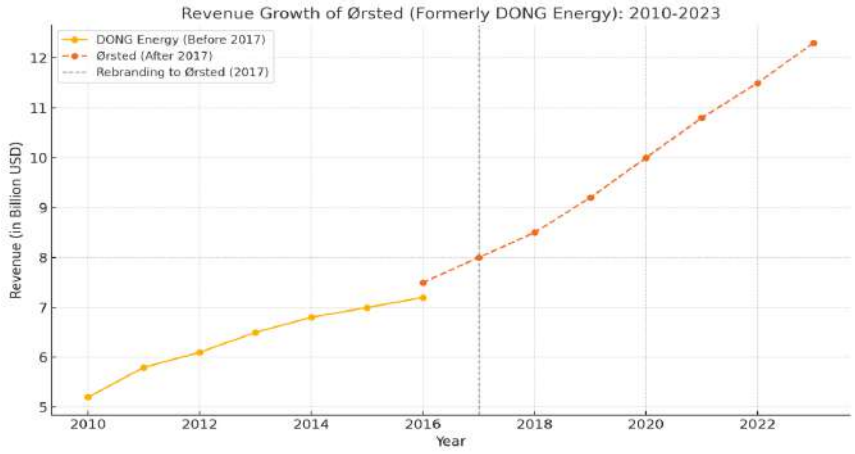
ESG investments often open doors to new markets, especially in regions or industries that value sustainability and ethical practices. The companies with higher ESG ratings also attract investments from funds prioritizing sustainable and responsible investing.

Example:Major institutional investors such as BlackRock, Vanguard, and ARK Invest have invested heavily in Tesla, drawn by its leadership in renewable energy and electric vehicles for environmental sustainability through zero-emission vehicles and renewable energy products like solar panels and energy storage solutions.

III. Enhanced Brand Reputation and Customer Loyalty

Companies with strong ESG credentials are perceived as ethical, responsible, and forward-thinking, boosting brand equity and customer loyalty. Businesses with strong ESG commitments are attractive to employees seeking purpose-driven careers.

Example: Unilever's Sustainable Living brands (e.g., Dove, Lifebuoy) grow 69% faster than the rest of its portfolio, significantly contributing to overall revenue.



IV. Better Risk Management and Stability

ESG-focused companies proactively address regulatory, environmental, and social risks, reducing
potential costs associated with fines, lawsuits, and crises.

Example: BP's Deepwater Horizon disaster in 2010 highlighted the financial consequences of poor ESG practices, costing the company billions in penalties and loss of reputation. Proactively managing such risks can avoid similar losses.

V. Long-Term Financial Performance

ESG investments often yield long-term value by aligning with future market trends and regulations. Companies that anticipate and adapt to these trends outperform competitors over time.Example: Renewable energy companies like Ørsted have seen significant growth after 2017(prior known as DONG Energy (Danish Oil and Natural Gas)) and profitability as the world shifts toward clean energy solutions.

Negative impact of ESG on profitability of business

While ESG (Environmental, Social, and Governance) investments can offer long-term advantages, they also present challenges that could negatively affect business profitability, particularly in the short term or for companies with limited resources. Below are the potential downsides.

I. High Initial Cost

Implementing ESG initiatives typically involves substantial initial investments in technology, infrastructure, or training. Compliance with ESG standards may also necessitate costly audits, certifications, and reporting systems.

II.Uncertain Financial Returns

ESG investments, such as improved energy efficiency or better brand reputation, may take years to deliver financial returns, posing short-term profitability challenges. Sourcing sustainable materials and ensuring ethical labor practices can increase complexity and costs, while compliance with ESG regulations may disrupt operations.

Example: ExxonMobil's shift toward ESG investments like carbon capture was criticized for being less profitable than its traditional fossil fuel operations.

III. Competitive disadvantage in Price-Sensitive Markets

Companies with strong ESG commitments may face higher production costs, making their products less competitive in price-sensitive markets. The ultimate burden of concerns ESG cost would fall on the consumers.

Example: H&M's push for sustainability in fast fashion led to higher costs and inventory challenges, impacting profitability.

IV. Investor Pressure and Short-Termism

Some investors focus on short-term returns rather than long-term ESG benefits, creating tension and potentially lowering valuations. Allocating resources to ESG initiatives may also result in reduced investment in core business activities, such as R&D or market expansion.

Suggestions

Improving the impact of ESG investments on business profitability involves strategic planning, execution, and integration of ESG principles into the company's operations. Integrating ESG objectives into the company's core mission and long-term strategy and focusing on ESG initiatives that complement the company's strengths and market opportunities, ensuring they contribute to financial and operational goals. Identifying and investing in ESG projects that offer measurable financial returns, such as energy efficiency, waste reduction, or sustainable product development can also have a greater impact on the concern's profit. AI, IoT, and block chain technologies can also be used in ESG investment.

CONCLUSION

ESG investments generate value by lowering costs, boosting revenues, attracting capital, and reducing risks, all of which enhance business profitability. Companies that embed ESG into their core strategy are better positioned for sustainable growth and long-term success in a dynamic and competitive market.

Abstract
Sustainable business and marketing focus on meeting the needs of people today without harming the environment or future generations. Businesses are now trying to reduce waste, save energy, and treat people fairly while still making a profit. Sustainable marketing helps promote products and services that are good for the environment and society. This approach builds trust with customers, supports long-term success, and helps solve global problems like C This paper explores how businesses can grow responsibly by using eco-friendly practices and honest marketing.
Key Words: Sustainable business and marketing - harming the environment - promote products and services - promote products and services - eco-friendly practices - honest marketing

1.INTRODUCTION:

In today's world, sustainability has become a key concern for businesses, consumers, and governments alike. With increasing environmental challenges, social inequalities, and resource limitations, businesses are being called upon to operate more responsibly. Sustainable business refers to practices that aim to reduce environmental impact, support communities, and ensure long-term economic growth.

At the same time, sustainable marketing plays a vital role in promoting products and services that are environmentally friendly and socially responsible. It goes beyond traditional marketing by focusing not only on profit, but also on people and the planet. This shift reflects changing consumer values, as more people now prefer to support brands that align with their beliefs about environmental care and ethical behavior.

In this presentation, we will explore the principles of sustainable business and marketing, why they are important, and how companies can adopt these practices to build trust, drive innovation, and achieve long-term success.

2.Statement Of Problem:

Many businesses still focus mainly on making profits and do not fully consider the impact of their actions on the environment and society. Even though people want eco-friendly products and honest marketing, companies often find it hard to use sustainable practices in their daily work and marketing. Problems like higher costs, doubts from customers, and confusing rules make it difficult for businesses to be truly sustainable. Because of this, many businesses miss the chance to help the planet, build trust with customers, and grow in the long run. This study looks at how businesses can better use sustainable methods in both their operations and marketing to create value for themselves and society.

3.Review Of Literature:

7. Studies find that customers are increasingly choosing brands that are environmentally friendly and socially responsible (Kumar et al., 2018).

8. Researchers note that higher costs, lack of knowledge, and strict regulations make sustainability difficult for some businesses (Bocken et al., 2014).
9. Many studies explain sustainable business as balancing economic success with caring for the environment and society (Elkington, 1997).
10. Companies like Patagonia and Unilever, showing how sustainable strategies can lead to competitive advantage and long-term growth Hart and Milstein (2003).

4.Benefits Of Sustainable Living And Markets:

1. Environmental Protection
   Reduces pollution, waste, and resource consumption.
   Long-Term Profitability
   Improves efficiency and lowers costs over time.
2. Enhanced Brand Reputation
   Builds trust and credibility with customers and stakeholders.
3. Customer Loyalty
   Attracts and retains customers who value ethical and eco-friendly brands.
4. Market Differentiation
   Helps stand out in a competitive marketplace.
5. Innovation Encouragement
   Drives development of new, sustainable products and services.
6. Regulatory Compliance
   Ensures adherence to environmental laws and standards.
7. Attracts Investors
   Draws investment from ESG-focused funds and socially conscious investors.
8. Employee Engagement
   Increases employee satisfaction and retention by promoting ethical values.
9. Risk Management
   Minimizes risks related to environmental damage and social issues.
10. Positive Social Impact
    Supports communities and promotes fair business practices.
11. Supports Global Sustainability Goals
    Contributes to worldwide efforts like the UN Sustainable Development Goals (SDGs).

5. Challenges Of Sustainable Business And Marketing

High Initial Costs
Implementing sustainable practices often requires significant upfront investment.
Lack of Consumer Awareness
Many consumers are still unaware or indifferent about sustainability issues.
Greenwashing Risks
Companies may exaggerate their sustainability efforts, leading to loss of trust.
Complex Regulations
Navigating environmental laws and standards can be difficult and costly.
Market Competition
Competing with companies that do not prioritize sustainability can be tough.
Short-Term Profit Focus
Pressure to deliver quick financial returns may discourage sustainable investment.

6.Case Study On Sustainable Business And Marketing :

Company Overview:

The Coca-Cola Company is one of the world's largest beverage companies, selling over 500 brands in more than 200 countries. While the brand is known for its wide global reach, it has faced criticism over plastic pollution, water usage, and environmental impact. In response, Coca-Cola has made sustainability a key part of its business and marketing strategy.

SUSTAINABLE LIVING PRACTICE

A.World without waste initiatives:

Coca-Cola launched the "World Without Waste" program to improve how the company manages packaging. Its main goals include:

Make 100% of packaging recyclable by 2025

Use at least 50% recycled material in packaging by 2030

Collect and recycle one bottle or can for every one sold by 2030

B. Sustainable Outsourcing:

Coca-Cola is improving its sourcing of ingredients like sugar, coffee, and tea by working with farmers on sustainable agriculture practices that reduce environmental damage and improve community livelihoods.

C. Carbon Reduction:

The company has pledged to reduce greenhouse gas emissions across its value chain and aims to reach net zero carbon emissions by 2050.

Sustainable Market Strategies:

1.Purpose driven-compaigns:

Coca-Cola uses marketing to raise awareness of environmental and social causes. For example, its "Every Bottle Has a Second Life" campaign educates consumers on recycling.

2. Eco friendly packaging messages:

Coca-Cola clearly labels products with recycling instructions and highlights when bottles are made from 100% recycled plastic. This educates consumers and encourages responsible behavior.

3. Local community marketing:

In many countries, Coca-Cola's sustainability efforts are communicated in local languages and adapted to regional environmental issues, which builds trust and relevance.

Results And Impact:

Coca-Cola's sustainability efforts have started to show meaningful results across several areas. Through its "World Without Waste" initiative, the company has made over 90% of its packaging recyclable, with many products now using bottles made from up to 100% recycled plastic. In terms of water stewardship, Coca-Cola has successfully replenished 100% of the water it uses in its beverages, making it one of the first global companies to achieve this target. Its work in sustainable sourcing has led to over 60% of key ingredients—like sugar, coffee, and tea—being sourced through verified sustainable practices. Additionally, the company has reduced greenhouse gas emissions from its operations by approximately 25%, and it continues working toward its goal of net zero emissions by 2050. From a marketing perspective, campaigns like "Every Bottle Has a Second Life" have increased consumer awareness about recycling and helped improve Coca-Cola's reputation, especially among environmentally conscious consumers. These efforts have not only reduced the company's environmental footprint but also strengthened its brand loyalty and trust around the world.

CONCLUSION

Coca-Cola's case shows that integrating sustainability into both business operations and marketing strategies can lead to positive environmental impact and long-term brand success. By focusing on recyclable packaging, water conservation, sustainable sourcing, and emissions reduction, Coca-Cola is taking responsibility for its environmental footprint. At the same time, its marketing campaigns promote awareness and encourage consumers to adopt eco-friendly habits. These combined efforts not only support global sustainability goals but also build stronger connections with conscious consumers. Coca-Cola demonstrates that large companies can make meaningful progress when sustainability is treated as a core value—not just a trend.

SOCIAL MEDIA INFLUENCE ON IMPULSE BUYING AMONG GEN Z AND MILLENNIALS

Dr.S.Balaji
Assistant Professor, School of Commerce, Nehru Arts and Science, Coimbatore

Abstract
This paper develops a theoretical framework to explain how social media stimulates impulse buying among Generation Z and Millennial consumers. Drawing on the Stimulus-Organism-Response (S-O-R) model, Theory of Planned Behavior (TPB), Uses and Gratifications (U&G) theory, and Social Comparison theory, it examines how platform affordances, content features, social cues, and influencer endorsements act as stimuli that trigger affective arousal, perceived scarcity, social proof, and parasocial trust, leading to impulsive purchase intentions and behavior. The model also highlights moderating factors such as platform type, product involvement, individual traits, and cultural context. This conceptual synthesis offers propositions for future empirical research and provides practical guidance for marketers, platform designers, and policymakers to promote responsible consumer engagement in social commerce environments.
Keywords: Social media, impulse buying, Gen Z, Millennials, S-O-R model, Theory of Planned Behavior, Uses and Gratifications, social comparison, parasocial interaction, social commerce

1. INTRODUCTION

Impulse buying, which refers to spontaneous and unplanned purchases triggered by emotional arousal and situational cues, has shifted from traditional retail settings to digital platforms, with social media now playing a central role. Platforms such as Instagram, TikTok, YouTube, and Snapchat have evolved into social commerce spaces that combine product discovery, influencer marketing, and instant purchasing, exposing users to personalized, visually appealing, and influencer-driven content that stimulates impulsive buying. This behavior is particularly prominent among Generation Z (1997–2012) and Millennials (1981–1996), who are digitally native, trend-sensitive, and highly active in mobile shopping. While Millennials generally have greater purchasing power and financial responsibilities, Gen Z consumers are more experimental, status-oriented, and influenced by social validation.

This paper develops a theoretical model to explain how social media drives impulse buying in these cohorts by integrating the Stimulus-Organism-Response model, Theory of Planned Behavior, Uses and Gratifications theory, and Social Comparison theory, and it aims to identify the mechanisms, mediators, and moderators involved, offering propositions for future research as well as guidance for marketers and policymakers.

2. Scope

This theoretical paper focuses on social media platforms that function as both content-sharing and commerce channels (i.e., social commerce platforms), examining how their features stimulate impulse buying behavior. The analysis centers on low-involvement, non-durable product categories such as fashion, beauty, small electronics, and lifestyle accessories, which are generally considered more susceptible to impulsive purchases (Chen et al., 2019). Rather than conducting empirical testing, the paper aims to develop a conceptual framework that explains the mechanisms, mediators, and moderators through which social media influences impulse buying among Gen Z and Millennial consumers.

3.Theoretical Foundations

3.1 Stimulus-Organism-Response (S-O-R)

The Stimulus–Organism–Response (S-O-R) framework explains how external environmental stimuli (S) influence internal psychological states (O), which subsequently drive behavioral responses (R) (Mehrabian & Russell, 1974). Within social media contexts, stimuli such as vivid short-form videos, limited-time promotional offers, influencer endorsements, and social proof cues can stimulate both cognitive and emotional reactions. These reactions include affective arousal (e.g., excitement, fear of missing out) and cognitive appraisals (e.g., perceived scarcity, product desirability), which together increase the likelihood of impulsive purchasing behavior (Chan et al., 2017).

3.2 Theory of Planned Behavior (TPB)

The Theory of Planned Behavior (TPB) proposes that behavioral intentions are shaped by attitudes, subjective norms, and perceived behavioral control (Ajzen, 1991). In the context of impulse buying, perceived behavioral control and individual impulsivity are particularly important. Lower self-control and higher sensitivity to normative pressures (e.g., likes, peer purchases) can reduce deliberation and increase susceptibility to spontaneous purchases (Lim et al., 2018). TPB can be adapted to account for instantaneous, spur-of-the-moment purchase intentions triggered by persuasive social media content, where decisions are made with minimal cognitive effort.

3.3 Uses & Gratifications (U&G)

Uses and Gratifications theory suggests that individuals actively engage with media to satisfy specific psychological and social needs such as entertainment, social interaction, and identity construction (Katz, Blumler, & Gurevitch, 1974). For Gen Z and Millennial consumers, social media serves as a space for trend-following, self-expression, and community participation (Whiting & Williams, 2013). These motivations often interact with commercial content: for instance, entertaining or aspirational videos that embed shopping links can transform the gratification experience into impulse purchase behavior (Islam et al., 2021).

3.4 Social Comparison and Parasocial Interaction

Social Comparison Theory explains how individuals compare themselves to others to evaluate their own status. Influencers and peers provide comparison targets; upward comparisons can trigger desire to emulate, increasing impulsive purchases. Parasocial interaction (one-sided perceived relationship with influencers) enhances trust and lowers resistance to marketing, strengthening impulse responses.

4. Conceptual Model — Mechanisms, Mediators, And Moderators

Social Comparison Theory posits that people evaluate themselves by comparing their status, appearance, or lifestyle to others (Festinger, 1954). On social media, influencers and peers act as salient comparison targets, and upward comparisons can spark desires to emulate others, thereby encouraging unplanned purchases (Lee, 2020). Similarly, parasocial interactions—the one-sided emotional relationships audiences form with influencerscan enhance perceived trust and reduce skepticism (Horton & Wohl, 1956; Chung & Cho, 2017). When consumers trust influencers, they are more likely to accept their recommendations impulsively, especially in fast-paced and emotionally charged social media environments.

4.1 Core Stimuli (S) on Social Media

- Platform affordances are the technical features of social mediasuch as algorithmic personalization, infinite scroll, autoplay, and in-app checkoutthat maximize product exposure and minimize friction, creating immersive content flows that encourage impulsive responses (Bucher & Helmond, 2018; Sundar &Limperos, 2013).
- Content features like short-form videos, visual posts, and user-generated content (UGC) present products authentically and engagingly, compressing attention and decision-making into brief spans and fostering affect-driven purchases (Voorveld et al., 2018; Djafarova& Bowes, 2021).
- Social cues—such as likes, comments, follower counts, and trending badges—act as social proof, reducing perceived risk and increasing product credibility (Cialdini, 2009; De Veirman, Cauberghe, &Hudders, 2017).
- Influencer cues which including endorsements, authenticity signals, live demos, and time-limited codes—leverage perceived credibility and relatability to drive emotionally persuasive, impulsive buying (Jin, Muqaddam, & Ryu, 2019; Lou & Yuan, 2019).

Organismic Mediators (O)

- Affective arousal,emotions like excitement or fear of missing out (FOMO)links social media stimuli to impulsive buying, as stimulating visuals, engaging narratives, and scarcity cues trigger emotional spikes that accelerate decisions and bypass rationality (Baumeister, 2002; Przybylski et al., 2013).
- Perceived scarcity or urgency from countdowns, “limited stock” labels, and flash sales raises the opportunity cost of delay, creating pressure for immediate purchases (Cialdini, 2009; Aggarwal & Vaidyanathan, 2003).
- Social proof and normative influence arise from likes, comments, follower counts, and “sold out” tags, which lower perceived risk and promote conformity-based buying (Deutsch & Gerard, 1955; De Veirman, Cauberghe, &Hudders, 2017).
- Parasocial trust forms through one-sided emotional bonds with influencers, increasing perceived authenticity and compliance while reducing skepticism (Horton & Wohl, 1956; Chung & Cho, 2017).
- Reduced deliberative processing occurs as fast, high-load content flows limit systematic thinking, making users rely on heuristics and emotions in purchase decisions (Kahneman, 2011; Petty & Cacioppo, 1986).

4.3 Behavioral Response (R)

The final stage is the behavioral outcome, seen as impulse purchase intention and actual buying behavior. This includes spontaneous, low-deliberation actions such as clicking “buy now,” instant checkout, or live-stream purchases, which occur immediately after exposure to persuasive stimuli, bypassing rational evaluation (Rook & Fisher, 1995; Verplanken&Herabadi, 2001). On social media, such instant purchases are reinforced by seamless checkout, scarcity cues, and emotionally arousing content, which lower psychological barriers and speed the shift from desire to action (Chen et al., 2019; Xiao & Nicholson, 2013).

4.4 Moderators (M)

Several moderating variables shape how strongly stimuli influence organismic states and how those states translate into behavior:

- Platform type: Visually immersive platforms (e.g., TikTok, Instagram) produce stronger emotional arousal than text-centric platforms (e.g., X/Twitter), intensifying impulsive responses.

- Product involvement and price: Low-priced, low-involvement products (e.g., fashion accessories, beauty items) are more prone to impulse purchases than expensive, high-involvement products.
- Individual traits: Personality characteristics such as impulsivity, materialism, low self-control, and limited financial literacy magnify the effect of social media stimuli on impulse buying.
- Cultural and contextual factors: In collectivist cultures, social proof may carry more weight, while individualist cultures emphasize personal preference.
- Temporal context: Situations like festive seasons, flash sales, and promotional events heighten urgency perceptions, amplifying the impulse effect.

6. Theoretical contributions

This framework synthesizes and extends existing theories by:

1. Integrating platform affordances as core stimuli in S-O-R models of impulse buying.
2. Articulating how parasocial relationships combine with social proof to create a potent, rapid-acting pathway to impulsive purchase behavior.
3. Specifying cohort differences (Gen Z vs. Millennials) as contingent on life-stage factors (financial responsibility, trend orientation) and platform preferences.

7. Managerial and policy implications

For marketers: Social media marketers should create short, emotion-rich content with clear calls-to-action for low-involvement products like fashion or beauty. Scarcity cues (e.g., limited-time offers) and social proof (e.g., likes, testimonials) can trigger impulses but should be used ethically (Cialdini, 2009; Wells et al., 2011). Gen Z responds to authenticity and trends, while Millennials prefer value and utility cues (Priporas et al., 2017; Djafarova& Bowes, 2021).

For platform designers: Features like autoplay, infinite scroll, and one-click checkout heighten impulsive behavior by reducing friction. Design nudges—cooling-off periods, confirmations, or spending reminders—can encourage thoughtful decisions and protect vulnerable users (Thaler & Sunstein, 2008; Mathur et al., 2021).

For policymakers and consumer advocates: Clear disclosure rules for sponsored content can reduce deceptive effects (Evans et al., 2017). Age-sensitive ad restrictions and financial literacy programs can help limit compulsive spending among younger users (OECD, 2020; Nair & Bhattacharyya, 2019).

8. Limitations

The model is theoretical and primarily focused on short-term affective drivers and low-involvement products. It does not fully account for post-purchase regret, returns behavior, social desirability bias in self-reports, or long-term brand loyalty effects. Also, cohort boundaries are approximations and overlap exists.

9. Future research directions:

- Experimental studies manipulating platform affordances (autoplay, countdowns) to measure causal effects on purchase impulses.
- Longitudinal studies to track whether repeated impulse purchases on social media lead to changes in financial well-being or purchase regret.
- Cross-platform comparisons to investigate how format (short video vs. static image) differentially affects arousal and impulse.
- Moderation analyses exploring financial literacy training or self-control interventions as buffers.

- Qualitative work (diaries, interviews) with Gen Z and Millennials to unpack subjective experiences of FOMO and parasocial engagement during purchase episodes.

Conclusion

Social media has reshaped shopping by merging stimuli, emotions, and purchase opportunities into seamless experiences, creating fertile conditions for impulse buying among digitally savvy Gen Z and Millennial consumers. This paper integrates the Stimulus-Organism-Response (S-O-R) framework, Theory of Planned Behavior (TPB), Uses and Gratifications (U&G) theory, and Social Comparison Theory to propose a conceptual model explaining how social media stimulisuch as platform features, content, social cues, and influencer endorsementstrigger cognitive-emotional processes like affective arousal, perceived scarcity, social proof, and parasocial trust, which drive impulsive buying behavior. The model also highlights key moderators, including platform type, product involvement, individual traits, and cultural context. Future empirical testing could offer insights for marketers to engage younger consumers ethically and guide policymakers in developing consumer protection measures and digital literacy programs to reduce vulnerability to impulsive spending in social commerce.

Abstract
Digital marketing has quickly become an essential part of contemporary business plans, changing how companies interact with customers and add value. Customer engagement, personalization, and brand visibility have all changed as a result of the expanding influence of social media, artificial intelligence, data analytics, and mobile technologies. The dynamic nature of this field is highlighted by emerging trends like omni-channel integration, voice search optimization, video content dominance, and influencer marketing. At the same time, tactics that emphasize content marketing, customer-centric experiences, and ethical data usage have become essential for maintaining competitiveness. This essay examines current developments in digital marketing, focusing on how they affect consumer behaviour, business expansion, and the direction of marketing strategies in an increasingly digitally connected world.

INTRODUCTION

Marketing has moved beyond conventional bounds to embrace technological advancements in the current fast-paced digital era. Companies in a variety of sectors are depending more and more on digital platforms to engage with consumers, establish their brands, and spur expansion. Businesses now approach marketing in a more individualized, interactive, and goal-oriented manner thanks to the quick development of social media, artificial intelligence, data analytics, and mobile technologies.

Understanding emerging digital marketing trends and adopting effective strategies is no longer optional but essential for sustaining competitiveness in a dynamic marketplace. From influencer marketing and video content to search engine optimization (SEO), automation, and omnichannel experiences, organizations must continuously adapt to stay relevant in the digital landscape. This article explores the latest trends in digital marketing and highlights strategies that can help businesses achieve greater reach, engagement, and long-term success.

Objectives

1. To analyse key digital marketing strategies.
2. To examine the challenges in digital marketing.
3. To explore opportunities in digital marketing.
4. To evaluate the role of data analytics in digital marketing.
5. To investigate the impact of emerging trends.
6. To assess the Integration of Digital and Traditional marketing.

Importance Of Digital Marketing Trends And Strategies

Digital marketing trends and strategies are crucial because they help companies stay competitive, increase customer engagement, support data-driven decision-making, and boost brand visibility, digital marketing trends and strategies are essential. Businesses can

maximize return on investment, adjust to changes in the market, and gain the trust of their long-term clientele by implementing the newest innovations. For instance, influencer partnerships and AI-driven personalization help businesses more successfully reach niche audiences, and video marketing and interactive content enhance real-time engagement.

Drives Of Digital Marketing Trends And Strategies

Technological Advancements: Personalization and engagement have been redefined by the rise of AI, ML, automation, voice search, AR/VR, and chatbots.
Changing Consumer Behaviour: Consumers are increasingly depending on peer reviews, mobile-first strategies, and personalized experiences.
Social Media Evolution: Influencers and short-form video on platforms like Instagram, and LinkedIn are changing how consumers interact with brands.
Content-Centric Marketing: Use storytelling, podcasts, and SEO-friendly content that is localized and voice-optimized instead of traditional advertisements.
Data Privacy & Security Concerns: Laws like GDPR force marketers to adopt ethical practices and focus on first-party data.
E-commerce and Digital Payments: Shoppable posts, live-stream selling, and seamless digital payments boost online shopping behaviour.
Globalization & Competition: Businesses compete globally, adopting localization and niche targeting.
Sustainability & Social Responsibility: Eco-conscious and socially responsible campaigns are becoming decisive factors in consumer choices.

Applications And Case Study
Trends in digital marketing are being applied in a variety of industries. Chatbots driven by AI enhance customer service, automation facilitates effective campaigns, and predictive analytics allows for tailored recommendations. Authenticity is increased through brand storytelling, user-generated content, and micro-influencers in social media marketing.

Case studies include:
Nike: Leveraged AI personalization and storytelling for higher engagement.
Zomato: Used meme marketing and data-driven personalization to boost retention.
Coca-Cola: Applied social listening for regional campaigns.
Nykaa: Successfully integrated online and offline channels with influencer marketing
.
Benefits Of Digital Marketing
Wider worldwide reach, cost-effectiveness, targeted campaigns, real-time engagement, and quantifiable outcomes are just a few advantages of digital marketing. It promotes innovation, raises conversion rates, strengthens customer relationships, and increases brand visibility. Businesses can obtain a competitive edge and successfully adjust to shifting customer demands by utilizing insights from analytics.

Challenges And Barriers
Despite its advantages, digital marketing faces some challenges like competition, data privacy issues, quick technical advancements, and expensive advertising. Changing consumer behaviour, including skepticism towards ads, also demands genuine and consistent engagement. Due to resource limitations, small businesses in particular find it difficult to stay up to date with changing trends.

Global & National Perspective

Marketing is being shaped globally by trends like influencer ecosystems, privacy-first tactics, short-form video dominance, and generative AI. Particularly important in India are performance-driven campaigns, vernacular content, mobile video consumption, and the use of AI tools. Short-form video and AI-assisted campaigns are essential for success in India, where businesses place a strong emphasis on cost effectiveness and local relevance.

Strategies For Effective Digital Marketing

1. Understanding the Target Audience through buyer person and behaviour analysis.
2. Developing a strong content marketing plan with blogs, videos, and infographics.
3. Leveraging social media platforms for engagement and storytelling.
4. Optimizing for search engines to enhance organic visibility.
5. Harnessing email marketing for lead nurturing and retention.
6. Investing in paid advertising for targeted reach.
7. Incorporating data analytics for decision-making and ROI measurement.
8. Embracing mobile marketing through apps and SMS campaigns.
9. Utilizing influencer and affiliate marketing for credibility and reach.
10. Focusing on customer engagement and experience for long-term loyalty.

Future Directions

AI integration, conversational marketing, video-first tactics, data privacy, omnichannel campaigns, and sustainability will all influence digital marketing in the future. While blockchain, AR/VR, and metaverse technologies will create new opportunities, influencer marketing will develop into long-term collaborations. Campaigns with a purpose will keep increasing consumer loyalty.

CONCLUSION

Digital marketing continues to evolve rapidly, driven by technological advancements and changing consumer behaviour. Businesses that adopt new tools, balance personalization with data privacy, and focus on authentic engagement will achieve sustainable growth. The future belongs to organizations that embrace adaptability, creativity, and purpose-driven marketing to build lasting brand loyalty in the digital era.

THE STUDY ON IMPACT OF ARTIFICIAL INTELLIGENCE AND TECHNOLOGY IN AUDIT PROCESS

Ms.G.Ilakkia
AssistantProfessor, Department of Corporate Secretaryship with CA
Dr. N.G.P. Arts and Science College, Coimbatore
Ms.Pranitha. B
I M. Com(CS), Department of Corporate Secretaryship with CA
Dr. N.G.P. Arts and Science College
Coimbatore

Abstract
The rapid advancement of Artificial Intelligence (AI) and emerging technologies is reshaping the auditing profession. Traditional audit processes that relied heavily on manual testing, sampling, and retrospective analysis are being replaced with technology-driven approaches that emphasize real-time monitoring, predictive analytics, and enhanced assurance. This paper explores the transformative impact of AI and technology in auditing, examining both opportunities and challenges. It discusses key innovations such as data analytics, robotic process automation (RPA), natural language processing (NLP), and blockchain, and evaluates how these tools enhance audit quality, efficiency, and fraud detection. The study also considers ethical implications, regulatory challenges, and the evolving role of auditors in a technology-enabled audit environment.
Keywords: Artificial intelligence(AI), Auditing,Data analytics, Blockchain,Fraud Detection

INTRODUCTION

The digital era has brought significant disruption across industries, and auditing is no exception. The increasing volume and complexity of financial data require auditors to adopt more sophisticated tools and techniques.AI and advanced technologies have the potential to shift the audit paradigm from traditional, sample-based testing to full-population analysis, offering greater accuracy and efficiency. This paper aims to analyze how AI and related technologies are influencing audit methodologies, outcomes, and professional roles.

Statement of problems

The rapid advancement of Artificial Intelligence (AI) and emerging technologies is transforming traditional auditing practices, presenting both opportunities and challenges for the profession. While automation, dataanalytics, andAI-driventoolshavethepotentialtoenhance efficiency, accuracy, and fraud detection, their adoption also raises concerns regarding reliability, ethical implications, auditor independence, and regulatory compliance.

Despite growing interest, there remains agapin understanding how AI and related technologies can be optimally integrated into audit processes without compromising audit quality, professional judgment, or stakeholder trust. Many organizations struggle with balancing the benefits oftechnologywiththerisksofover-reliance on automated systems. Furthermore,the lack of standardized frameworks and limited empirical evidence on the practical implications of AI adoption in auditing hinder the ability of regulators, firms, and practitioners to make informed decision.

Literature review

Artificial Intelligence in Accounting and Auditing: AI enables auditors to analyze vast datasets, detect anomalies, and identify risks more effectively.

Data Analytics and Big Data: With access to real-time financial information, auditors can perform continuous auditing instead of periodic checks.
RoboticProcessAutomation (RPA): Repetitiveaudittaskssuchasdataentry,reconciliations, and confirmations can be automated, freeing auditors to focus on judgment-intensive areas.
BlockchainTechnology: Immutable digital records on blockchain improve transparency and reduce the risk of fraud or misstatement.

Benefitsofaiandtechnologyinauditprocess

EnhancedEfficiency

Automates repetitive tasks like data entry, confirmations,andreconciliations.

Speeds up audit cycles, allowing auditors to focus on analysis and decision-making.

ImprovedAccuracyandReliability

Reduceshumanerrorincalculationsanddatahandling.

AImodelsdetectanomaliesandinconsistenciesthatmaybeoverlooked manually.

ComprehensiveDataAnalysis

Enablesanalysisof100%oftransactionsinsteadoflimited samples.

Identifies hidden patterns,fraud indicators,andirregularitiesinlargedatasets.

Real-TimeandContinuousAuditing

Shifts auditing from periodic, retrospective reviews to on going,real-timemonitoring.

Providesearlywarningsandproactivedetectionof risks.

StrongerFraudDetectionandRiskManagement

AI-drivenpredictiveanalyticshighlightunusualbehaviororfraudulentactivities.

Helpsorganizationsstrengtheninternalcontrols.

Cost-Effectiveness

Reducesmanuallaborandoperationalcosts.

Optimizesresourceallocationforauditteams.

Challenges and limitations

ChallengesandLimitationsofAIandTechnologyinAuditProcess

1. HighImplementationCosts–AdvancedAIsystemsandinfrastructuredemand significant investment, making adoption difficult for smaller firms.
2. SkillGapAmongAuditors–Manyprofessionalslacktrainingindataanalyticsand AI, creating agap between traditional auditing skills and new technologicalrequirements.
3. DataSecurityandPrivacyRisks–AItoolshandlesensitivefinancialinformation, increasing vulnerability to cyber threats and breaches.
4. Bias and Transparency Issues –AI models may produce flawed results due to biased data, and their "black-box" nature reduces transparency in decision-making.
5. RegulatoryandEthicalChallenges–LackofclearauditingstandardsforAIraises questions of accountability, compliance, and ethical use of technology.

FutureTrendsinAIandTechnologyinAuditProcess

1. Continuous Real-TimeAuditing –Audits will shift from periodic reviews to ongoing, real-time monitoring of financial transactions and risks.
2. Contracts Blockchain and Smart – Immutable digital ledgers and automated contracts will strengthen transparency and trust in auditing.
3. ExplainableAI (XAI) –AI systems will become more transparent, allowing auditors and regulators to understand and validate AI-driven decisions.
4. PredictiveandPrescriptiveAnalytics–Futureauditswillnotonlydetectfraudbutalso forecast risks and recommend preventive measures.

Hybrid Auditor Roles – Auditors will evolve into tech-enabled professionals, combining traditional accounting skills with AI, data science, and IT expertise.

Casestudy

1. Deloitte–AI-PoweredAuditAnalytics

Deloitte developed its Argus AI platform to analyze 100% of client transactions using machinelearningandNLP.Thisreducedaudittimeby50%,improvedfrauddetection,and provided predictive insights.

2. PwC –AI in Fraud Detection

PwC introduced GL.ai, anAI tool that scans millions of journal entries in real time. It identifies unusual patterns, high-risk transactions, and compliance gaps, enhancing accuracy and efficiency in fraud detection.

3. KPMG–Blockchain-EnabledAudits

KPMGpartneredwithMicrosofttointegrateblockchainauditingtools. By using immutable ledgers and smart contracts, they ensured transparent, real-time verification of financial data for clients in banking and supply chain sectors.

4. EY(Ernst&Young)–Robotic Process Automation(RPA)

EY deployed RPA fort askslikeinvoice processing, reconciliations, anddata entry. This automation reduced manual workload, minimized human errors, and allowed auditors to focus on higher-value risk assessments

Findings

The study reveals that Artificial Intelligence (AI) and emerging technologies are significantly transforming the audit process by shifting from traditional, manual, and sample-basedmethodstotechnology-driven,real-time,andfull-populationanalyses.AI-powered tools such as data analytics, robotic process automation (RPA), and natural language processing (NLP) enhance efficiency, accuracy, and fraud detection, while blockchain technology ensures transparency and reliability of financial records. Case studies from leading firms like Deloitte, PwC, KPMG, and EY demonstrate measurable improvements in audit quality, speed, and risk management. However,thefindingalso highlightmajorchallengessuch ashighimplementationcosts,dataprivacyconcerns,skill gaps among auditors, and lack of global regulatory standards.

CONCLUSION

The integration of Artificial Intelligence (AI) and advanced technologies is transforming the auditprocess from a traditional, sample-basedactivityinto adata-driven, continuous, and predictive practice. AI-powered analytics, robotic process automation, blockchain, andnaturallanguage processinghaveenhance defficiency,accuracy,andfraud detection while enabling real-time auditing and deeper insights for decision-making.However, this transformation is not without challenges. High implementation costs, cybersecurity risks, skill gaps, and the absence of global regulatory standards present significantlimitations. Despitethesehurdles,the long-termbenefitsfaroutweightherisks.

In conclusion, AI and technology represent a paradigm shift in auditing—empowering auditors to deliver more reliable, transparent, and value-added services, while positioning the profession for a digitally driven future.

DIGITAL CLAIMS & CUSTOMER EXPERIENCE IN THE INDIAN INSURANCE SECTOR

Mr. P. Saravanakumar
Assistant Professor in Commerce
Rathinam College of Arts and Science, Coimbatore

Abstract
These proceedings paper reviews recent developments (2023–2025) in digital claims management and customer experience (CX) across India's insurance sector. It synthesizes regulatory changes, technological innovations, platform initiatives, and operational practices that are reshaping claims fulfilment and policyholder interactions. The paper highlights successes, persistent pain points, and practical recommendations for insurers, regulators, tech vendors, and healthcare providers aiming to create faster, fairer, and more transparent claims journeys.
Insurance is an assurance of financial protection and risk coverage during uncertain times, and the claim settlement process is the moment of truth for every insurer. Traditionally, claims handling has been time-consuming, paper-driven, and frustrating for customers, often leading to negative experiences. With digital transformation, insurers are adopting Artificial Intelligence (AI), Robotic Process Automation (RPA), block chain, cloud solutions, and mobile platforms to streamline claims. This paper explores how digital claims management impacts customer experience by improving efficiency, transparency, and trust. It also examines the challenges of digital adoption and presents future opportunities for insurers in creating a balance between technology and human empathy.
Keywords: Digital claims solutions, customer trust, retention, and brand reputation. Customer-facing CX channels, to highlight how digital tools enhance customer experience. Automation & AI in Verification, future improvements, Emergence of national platforms and aggregation initiatives aimed at connecting distributors, claims with photos, e-signatures, and real-time status updates.

INTRODUCTION

In recent years, digitalization has transformed claims management from a complex, paperwork-heavy process into a simplified, customer-friendly journey. Digital claims solutions, powered by automation and AI, are helping insurers process claims faster, detect fraud, and deliver greater transparency. This transformation is not only improving efficiency but also redefining customer experience in insurance.

Claims management and customer experience form the operational heart of any insurer. While policy sales generate revenue, claims processing directly influences customer trust, retention, and brand reputation. Over the past two years India's insurance sector has accelerated digital adoption — driven by regulatory nudges, Insurance Tech entrants, AI innovations, and COVID-era expectations for contactless, fast service. This paper focuses on the recent-day landscape and offers actionable guidance for stakeholders.

Scope and Objective

1.Digital claims automation (end-to-end and partial)
2.Customer-facing CX channels (mobile apps, portals, catboats)
3. Regulatory and ecosystem changes affecting claims
4.Representative case examples and best-practice recommendations
5.To highlight how digital tools enhance customer experience.
6.To examine challenges faced by insurers in digital claim adoption.

7.To suggest strategies for future improvements.

The Digital Claims Process

The digital claims process integrates technology at every stage to minimize manual effort and maximize efficiency. The main components are:

a. Claim Intimation & Registration – Customers can lodge claims instantly through mobile apps, websites, or catboats, reducing paperwork.

b. Automation & AI in Verification – AI verifies documents, detects fraud, and uses predictive analytics.

c. Robotic Process Automation (RPA) – Automates repetitive tasks ensuring accuracy and speed.

d. Block chain for Transparency – Ensures secure and immutable claim records.

e. Settlement & Payout – Enables real-time settlements and digital transfers.

The role of Claims Digital Transformation

a.Automate routine tasks:Free up adjusters for more complex, value –added work.

b.Provide personalized, proactive customer interactions: use data and analytics to anticipate needs and offer tailored support.

c. Leverage digital insights for claims: Analyze claims data to identify trends, predict outcomes, and optimize processes

d. Adapt quickly to change: Respond to regulatory shifts, new risks, and evolving customer expectations with agility.

Recent regulatory and ecosystem shifts

India's regulator and national platforms have been active in shaping claims and CX expectations. Important themes include:

- A stronger push toward cashless and streamlined health claim settlements, with regulators issuing master circulars and guidance that encourage standardized processes and improved service delivery.
- Emergence of national platforms and aggregation initiatives aimed at connecting distributors, insurers, TPAs, and customers to reduce friction in distribution and servicing.
- Increased scrutiny of provider billing and claims inflation within the national claims exchange, prompting conversations about tighter oversight and improved rate-setting.

These shifts have encouraged insurers to modernize claim adjudication, speed up settlement times, and invest in customer communications.

Technology trends transforming claims and CX

Several technology patterns have moved from pilot to production across insurers and TPAs:

a.AI and ML for deaccessioning:

AI models are being deployed to automate first-level adjudication, triage claims by severity, detect anomalies, and flag likely fraud. These models reduce manual touchpoints and accelerate customer-facing outcomes.

b.RPA and OCR for document ingestion:

Optical Character Recognition (OCR) combined with Robotic Process Automation (RPA) extracts key fields from documents (discharge summaries, invoices), populates claims systems, and triggers workflows—shortening turn-around-times considerably.

c. Mobile-first claim filing and self-service:
Mobile apps and responsive portals enable customers to file claims with photos, e-signatures, and real-time status updates. Push notifications and in-app messaging reduce uncertainty and call volumes.
d. Chatbots and conversational AI:
Chat-based assistance handles routine queries, initiates claim filings, and collects missing documents via guided flows. Hand-offs to human agents are used for complex cases.
e. Embedded insurance & API ecosystems:
APIs and platform integrations allow insurers to receive claims data from hospitals, aggregators, and third-party platforms, speeding up verification and enabling near real-time settlements.
f. Data analytics & provider management (Provider 360):
Insurers are investing in provider-management platforms to monitor hospital behavior, price variations, and quality metrics—supporting negotiations and network optimization.

Operational models and partnerships
To scale digital claims, insurers are adopting hybrid operating models:

- Outsourcing portions of claims processing to specialized TPAs or AI-platform vendors.
- Co-developing platforms with Insurance Techs to embed automation and analytics.
- Building centralized claims hubs and orchestration layers for consistent CX across products.

Examples include large health insurers partnering with AI-driven TPA platforms to speed adjudication and improve fraud detection.

Customer experience: what customers care about now
Contemporary policyholders emphasize the following in their claims journeys:

- Speed of settlement and transparency of status.
- Clear, empathetic communication during distress (especially health claims).
- Simpler documentation requirements and less repeated requests.
- Fairness and predictability in claim outcomes.

Designing journeys with these priorities reduces complaints, lowers churn, and boosts Net Promoter Scores (NPS).

Case studies
a. Insurer–TPA AI partnership:A leading retail health insurer outsourced a major chunk of claim adjudication to a third-party AI-powered platform. The platform automated initial checks, reduced manual review rates, and improved fraud detection—resulting in measurable declines in turnaround time and rework.
b. National platform initiatives: New aggregation platforms aim to standardize distribution and servicing. The operational readiness of such platforms influences how quickly insurers can provide unified CX across channels.
c. National claims exchange oversight: Heightened government interest in oversight of the national claims exchange has led insurers to re-examine provider pricing, negotiate standard rates, and work on mechanisms to prevent billing inflation—directly impacting claims outflow and customer premiums.
Challenges and risks

- **Fraud & abuse:** Sophisticated fraud techniques and collusion require ongoing model retraining and cross-industry data sharing to detect.

- **Provider behavior:** Unstandardized billing and hospital overcharging can inflate claims and erode trust between insurers and customers.
- **Data quality and interoperability:** Fragmented systems and inconsistent data formats hamper automation and increase manual exceptions.
- **Privacy, consent & compliance:** Using sensitive health data for AI and analytics requires careful governance and adherence to privacy norms.
- **Customer digital literacy:** Not all customers prefer or can use digital channels; hybrid journeys must remain available.

Practical recommendations

a. For insurers & TPAs

Build layered automation: use AI for triage, RPA/OCR for ingestion, and human expertise for exceptions.Invest in a single source of truth (claims orchestration layer) to ensure consistent CX across touchpoints. Use provider-360 tools to monitor hospital pricing, quality, and behavior and negotiate standardized bundles.Publish clear SLAs for claim acknowledgement and settlement; proactively communicate statuses.

b. For regulators & policymakers

Encourage standard data schemas and API-based integrations to reduce friction between hospitals, insurers, and national platforms.Support transparent reporting on claim turn-around-times and grievance resolution to increase accountability.Promote secure data-sharing frameworks for fraud analytics while protecting consumer privacy.

c. For Insurance Tech vendors

Focus on explain ability of AI decisions to ease adoption by insurers and acceptance by claimants.Offer modular solutions that integrate with legacy core systems and modern cloud-native stacks.

d. For hospitals and providers

Adopt coding and billing standards that enable faster verification.Participate in provider-management programs and transparent pricing initiatives to reduce disputes.

An effective architecture typically includes:

1. Customer-facing channels (mobile/web/chat)
2. Ingestion layer (OCR, document validation)
3. Claims orchestration & workflow engine
4. AI deaccessioning& fraud-scoring module
5. Provider management and rate repository
6. Audit, compliance & reporting layer

This layered design improves modularity, governance, and the ability to iterate quickly.

Measuring success: KPIs

Track these KPIs to evaluate digital claims and CX impact:

- Claim turnaround time (TAT): acknowledgement → settlement
- First-time-right claims %
- Manual intervention rate
- Fraud detection precision/recall
- Customer satisfaction (CSAT) / NPS post-claim
- Grievance & Ombudsman escalations

CONCLUSION

India's insurance ecosystem has entered an accelerated phase of digital transformation for claims and customer experience. Regulatory nudges, national platform developments, and AI-enabled Insurance Tech partnerships have moved automation from pilots into production. To realize the full benefits—faster settlements, lower leakage, and higher customer trust—stakeholders must coordinate on data standards, provider management, and explainable automation.

THE ROLE OF AI IN TRANSFORMATION CUSTOMER ENGAGEMENT AND BUSINESS PERFORMANCE

Dr. Swarnalatha V
Assistant Professor, Department of Management & Commerce, Christ Academcy Institute of Law
Geethanjaly Surjith
BBA LLB Student, Christ Academcy Institute of Law

Abstract
Artificial Intelligence (AI) has evolved majorly from mere supporting technology to a central force of customer engagement and business performance. This paper explores two major aspects of the topic that includes the enhancement in customer engagement through personalisation, predictive insights and real-time interaction and also the impact of AI adoption on business performance in terms of efficiency, decision-making and competitive advantage. This study relieson a qualitative and doctrinal research methodology approach byemphasisingon recent peer-reviewed articles, industry reports and legal frameworks published particularly after 2022, thereby ensuring contemporary relevance of the research.
AI transforms personalisation into a strategic asset for businesses thereby improving predictive accuracy in anticipating customer behaviour and fosters real-time engagement through chatbots and virtual assistants. AI strengthens operational efficiency and supports evidence-based decision-making. However, the paper also emphasises ethical and legal challenges faced by the adoption of AI. A conclusion is derived that AI's long-term transformative potential can only be utilised if aligned with fairness, competitiveness with inclusivity and innovation with accountability.
Keywords: Artificial Intelligence, Customer Engagement, Business Performance, Personalization, Predictive Analysis, Real-time Interaction, Ethical AI

INTRODUCTION
One of the most transformative technologies of twenty-first technology has been Artificial Intelligence (AI). This has reshaped how businesses interact with customers and manage internal operations. Customer engagement was built on static segmentation and reactive strategies traditionally. But AI-driven systems enable real-time personalisation, predictive analytics and seamless interaction through chatbots and virtual assistance these days. Brand loyalty and market reach is expanded by these developments that redefine consumer experiences thereby creating more opportunities for a firm. AI has become an indispensable tool across industries from retail and banking to healthcare and logistics since it has been globally adopted and accelerated rapid advances in machine learning, big data and natural language processing.

AI implications also have profound impact in business performance also. Operational efficiency, data-driven decision making and competitive advantages are enhanced by AI in businesses. These advantages certainly comealong with challenges that has to be dealt with in order to preserve ethical considerations and customer belief. Data privacy, algorithmic bias, ethical governance and uneven access to AI are the major risks posed by AI that are of concern to businesses and policymakers. This paper evaluates the contribution of AI to organizational success by also critically reflecting on the ethical and regulatory concerns that accompany its widespread use thereby reflecting on the dual nature of AI.

Literature Review

Recent papers demonstrates that artificial intelligence (AI) has influenced customer engagement and business performance, with particularly research works after 2022 focusing on personalisation, predictive insights, conversational AI, efficiency and ethics. Personalisation is central. Sharma and

- Patel (2023) in AI-Driven Personalisation in E-Commerce, found out that deep learning systems enhance recommendation accuracy and boost customer royalty. McKinsey's Next in Personalisation (2023) also reports that firms that has adopted AI acquire revenue growth and AI based customer experiences. Predictive insights have also advanced: Kumar et al (2024) in Predictive Analytics for Customer Churn in Telecom demonstrates that over 90% accuracy is possible by using AI models enabling targeted retention.
- Operational efficiency of AI in businesses is also well documented in various papers such as Deloitte's Generative AI in Business (2023) where it finds that automation in business delivers significant productivity gains, particularly in logistics and finance. A systematic review by Gomez et al (2024) in Frontiers in Artificial Intelligence emphasize on hybrid mode of human-AI interaction as the most effective model for real-time engagement.

Methodology

This paper uses a qualitative and doctrinal research methodology, relying primarily on secondary sources such as peer-reviewed journal articles, policy documents, industry reports and legal frameworks majorly published after 2022. Academic databases including Google Scholar, JSTOR and Scopus were used to find articles related to AI in customer engagement and business performance to emphasis on most recent empirical and theoretical contributions. Further, the research is structured around two objectives. Firstly, analysing how AI enhances customer engagement through personalization, predictive insights and real-time interaction and secondly, the impact of AI adoption on business performance in terms of efficiency, decision-making and competitive advantage. By synthesising these interdisciplinary sources, the methodology gives a clarity and critical understanding of how AI is reshaping the business patterns and also how important is ethical considerations for sustainable adoption of AI.

Objective

1. To analyse how AI-driven tools and technologies enhance customer engagement through personalization, predictive insights and real-time interaction.
2. To evaluate the impact of AI adoption on business performance in terms of efficiency, decision-making and competitive advantage.

Findings

1. Impact of AI-driven tools and technologies in enhancing customer engagement through personalization, predictive insights and real-time interaction?

I. AI-Enabled Personalization

Artificial Intelligence (AI) has transformed personalisation from a marketing strategy into a core mechanism of customer engagement.Demographic segmentation and historical purchasing behaviour was the basis for personalisation traditionally. AI driven personalization uses dynamic machine learning algorithms, real-time analytics and natural language processing apart from the traditional static methods to provide services at an individual level.Highly specific recommendations that meet individual preferences with updated accuracy can be generated with the help of AI systems by analysing customer browsing patterns, transactional data and even contextual factors such as location or time of access.

E-commerce platforms such as Amazon demonstrate this transformation from traditional method to modern method, using AI-based collaborative filtering models to suggest items frequently purchased together or those similar to customer's browsing history. Netflix also similarly uses a sophisticated recommendation engine that gives personalised watchlists by analysing viewing patterns, rating behaviour and content similarities. Their business outcomes show significant effectiveness using these tools-Netflix has reported that more than 80% of content watched on its platform is driven by AI-powered recommendations. This shows that personalisation not only improves customer satisfaction but also directly influences engagement and retention.

Data privacy and potential misuse of personal information are the major concerns raised by this personalisation. Regulatory frameworks such as GDPR and India's Digital Personal Data Protection Act impose obligations on firms to ensure transparency and consent in data usage. Thus, balance of ethical practices should be maintained to build trust while personalisation enhances engagement.

II. Predictive Insights and Customer Behaviour

AI make use of predictive insights by leveraging big data analytics and machine learning models to anticipate customer behaviour. Predictive analytics are used by firms to forecast purchase patterns, churn probability and customer lifetime value.Businesses use this data to proactively design retention strategies, optimise campaigns and allocate resources more effectively.

For example, various telecom companies use AI to predict customer churn by analysing call data and service usage. However,over reliance on historical data can also result in risks of bias and inaccurate predictions occasionally. Therefore, transparency and continual model improvement are critical.

III. Real-Time Interaction and Engagement

Chatbots, virtual assistants and natural language processing systems, that are AI powered toolstransforms real-time customer engagement. Companies such as HDFC Bank and Sephora establish AI chatbots which respond instantly to customer queries that can reduce wait times and improving satisfaction.24/7 availability, enhancing accessibility while reducing service costs are provided by these systems.Voice assistants used by Alexa and Google assistant are AI driven and they integrate into everyday life of customers making the engagement seamless.

Real-time engagement also includes social media monitoring, where AI tracks sentiment and customer feedback. Complaints are resolved instantly and campaigns are adapted by companies using these insights. The risk of impersonal interactions if AI lacks empathy, is a challenge. The ethical questions about constant monitoring of consumer activity also raises questions about maintaining balance between efficiency with authenticity.

IV. Ethical and Legal Considerations in Engagement

AI driven predictions come along with ethical and legal challenges. Privacy violations, algorithmic bias and over reliance on automated-systems are some of the key concerns. Customers worry about how their personal data is used by companies for marketing. Bias in AI systems often leads to discriminatory targeting or exclusion of vulnerable groups. For example, at instances, flawed algorithms in advertisements have excluded women and minorities from job-related content eroding consumer trust and exposing firms to legal liability.

Regulatory frameworks such as GDPR in the EU and the proposed EU AI Act impose obligations on businesses to certify lawful, ethical and transparent AI use. Similarly in India, the Digital Data Protection Act(2023) governs consent and accountability. Therefore, compliance of ethical safeguards into AI driven strategies must be integrated by firms to ensure long-term engagement.The impact of AI adoption on business performance in terms of efficiency, decision-making and competitive advantage.

I. Operational Efficiency and Automation

Operational efficiency is significantly enhanced by AI automating repetitive tasks, reducing costs and improving accuracy. AI powers predictive maintenance in manufacturing by anticipating equipment failures, lowering downtime and boosting productivity. Logistics companies such as DHL use AI-driven route optimisation that saves fuel and improves delivery times. Dynamic pricing algorithms are used by retailers to adjust prices in real time, maximising sales opportunities.Robotic Process Automation (RPA) processes routine tasks such as invoice handling and compliance checks with speedy and accuracy in service industries.It reduces operational expenditure and frees employees to focus on innovation and customer-focused roles.

Risk exists despite efficiency gains. Social challenges are created by the displacement of human workers through automation. Cyber attacks and technical failures are vulnerabilities introduced by the over reliance on AI systems. Hence, firms must adhere to aligning efficiency with resilience and workforce adaptation while implementing AI along with balanced strategies.

II. Data-Driven Decision-Making

AI vitalizes business decision-making by transforming data sets into actionable insights. Firms forecast trends, assess risks and optimise strategies with the aid of machine learning and predictive analytics. AI-driven trading platforms analyse real-time market data in finance for faster and more precise execution. Financial inclusion is widened by incorporating unconventional data sources in credit scoring models.

Algorithmic bias is the main challenge possessed by AI where it replicates historic inequalities. Moreover, AI models lack transparency such as the ‘black box problem’ raising concerns about accountability. Ethical frameworks, explainable AI and regulatory oversight is required to ensure decisions are fair, transparent and socially responsible.

III. Competitive Advantage and Market Responsiveness

Competitive advantage by enabling faster innovation, targeted marketing and enhanced customer insights are created through AI adoption. Spotify uses AI for enabling personalised recommendations, building loyalty and sustaining market dominance. Rapid responsiveness to demand shift is ensured by retailers by using predictive analytics to optimise promotions and inventory.

However, these advantages are unevenly distributed. Competition is reduced raising concerns of market concentration wherein large firms has access to big data and capital dominance. Also, hyper-competition driven by AI encourage short-termism over long -term sustainability. Balancing innovation with consumer welfare and fair competition is therefore need to be taken into consideration by the regulators.

IV. AI and Strategic Transformation

Strategic transformation of industries is enabled by AI thereby extending beyond incremental improvements. New opportunities in content creation, software development and market are

formed through this shift. Advertising agencies deploys AI to generate customised campaigns across consumer segments, enhancing creativity and cost reduction.
Disruption is also bought along with this transformation. Adoption is further complicated by ethical concerns like surveillance, bias and accountability. Ensuring inclusivity, sustainability and fairness must be encouraged by policymakers while encouraging innovation.

CONCLUSION

The study reveals that AI is not merely a technological innovation of the era but a central force of change in both customer engagement and business performance. AI fosters stronger consumer relationships and enhance satisfaction through personalisation, predictive insights and real-time interaction. Efficiency and competitiveness across sectors are brought by AI through its ability to automate processes, generate actionable insights and enable strategic transformation. Case studies of top firms reveals that AI adoption directly influences profitability and long-term growth, underscoring its transformative potential.

Critical challenges also accompany this transformation. Over-reliance on AI increases the risk of data misuse and algorithmic bias. This acts as a threaten to consumer trust and fair competition if left unchecked. Legal frameworks like GDPR, the proposed EU AI Act and India's Digital Personal Data Protection Act underscores the significance of embedding transparency, accountability and ethical safeguards in AI deployment.Balancing technological innovation with responsible governance is the only way for sustainable adoption of AI in business. AI's role in reshaping customer engagement and business performance is undeniable.However long-term success depends onaligning efficiency with fairness, competitiveness with inclusivity and innovation with accountability.

Dr.N.G.P Arts and Science Collage, Coimbatore

Abstract
In today's digital-first world, social media has become more than just a communication tool — it has evolved into a central pillar of modern marketing strategies. With billions of people actively engaging on platforms like Facebook, Instagram, YouTube, TikTok, and X (Twitter), businesses now operate in an environment where consumer interactions, opinions, and brand perceptions are shaped in real time. This paper investigates how social media marketing influences consumer behavior, brand loyalty, and purchase decisions while also evaluating the opportunities and challenges faced by organizations. Drawing insights from existing literature, the study examines engagement metrics, influencer collaborations, and algorithm-driven personalization, offering a well-rounded perspective on the subject. The findings highlight that while social media provides cost-effective campaigns, wider global reach, and personalized engagement, it also raises concerns such as misinformation, consumer fatigue, and data privacy issues. Overall, the paper underscores the dual nature of social media marketing — a powerful opportunity, but one that requires authenticity, transparency, and responsibility for long-term effectiveness.
Keywords :Social Media Marketing; Consumer Engagement; Digital Word-of-Mouth (eWOM); Influencer Marketing; Algorithmic Targeting; Brand Loyalty; Digital Communication.

INTRODUCTION

Over the past decade, the rise of Web 2.0 technologies has completely transformed the way brands and consumers interact. Traditional one-way marketing, such as television ads or print media, is no longer enough to influence consumer decisions in a hyper-connected world. Instead, social media platforms have redefined the rules by offering interactive, dynamic, and community-driven spaces where businesses and customers engage on an almost daily basis.

According to Statista (2024), there are now over 5 billion active social media users worldwide. For marketers, this represents both an immense opportunity and a daunting challenge. On one hand, companies can instantly reach global audiences, track consumer engagement, and personalize campaigns with high precision. On the other, the same platforms are saturated with competing voices, algorithmic uncertainties, and heightened consumer expectations for authenticity.

The central purpose of this paper is to analyze the influence of social media marketing on consumers and businesses alike. By reviewing scholarly studies and industry reports, this research aims to highlight how social media shapes consumer psychology, what opportunities it offers for marketing strategies, and what risks companies must navigate in an age of digital transparency.

Objectives of the Study

The research is guided by the following objectives, which aim to clarify the scope and provide a comprehensive understanding of the topic:

1. **To explore the strategic significance of social media platforms in modern marketing ecosystems.** This includes identifying how platforms serve as spaces for branding, advertising, and consumer interaction.
2. **To analyze the influence of social media marketing on consumer behavior.** The focus is on decision-making patterns, purchase intentions, brand trust, and the role of digital word-of-mouth (eWOM).
3. **To evaluate the opportunities and advantages of adopting social media marketing.** Key benefits such as cost-effectiveness, global connectivity, and personalized engagement are examined.
4. **To critically assess the challenges and risks associated with social media marketing.** These challenges range from privacy concerns and misinformation to consumer fatigue and ethical dilemmas in data handling.
5. **To investigate the role of influencers and algorithmic personalization in shaping consumer perceptions.** This involves analyzing both the effectiveness and the limitations of influencer-driven campaigns.
6. **To bridge theoretical research with practical application.** The study aims to translate scholarly insights into actionable strategies for businesses and marketers.
7. **To contribute to academic scholarship in digital marketing.** The research provides a foundation for future exploration of topics like AI-driven engagement, cross-cultural differences, and the sustainability of social media strategies.

Literature Review

- The academic conversation around social media marketing is rich and evolving. Kaplan and Haenlein (2010) described social media as applications that enable user-generated content and foster interaction — a definition that remains highly relevant today. Mangold and Faulds (2009) added that social media blurs the boundaries between personal and commercial communication, positioning it as a hybrid element of the promotional mix.
- Consumer engagement has been widely researched. Brodie et al. (2013) suggested that engagement is not merely about transactions but includes emotional and cognitive connections. Hollebeek et al. (2019) emphasized that interactive experiences contribute to stronger customer loyalty and long-term brand advocacy.
- Another important theme in literature is influencer marketing. Djafarova and Trofimenko (2019) showed that micro-influencers, who are perceived as more authentic and relatable, can have stronger influence over younger audiences compared to traditional celebrities. However, Marwick (2015) noted that excessive commercialization of influencer content risks diminishing trust.
- Critical perspectives also emerge. Zuboff (2019) warned against "surveillance capitalism," highlighting how user data is commodified for targeted advertising. Similarly, Andreassen et al. (2018) pointed out the risks of compulsive social media usage, which may affect consumer well-being and backlash against brands perceived as exploitative.

Methodology

This study employs a qualitative, descriptive methodology based on secondary research. A review of scholarly journal articles, books, and industry reports from 2009 to 2024 was undertaken to build a conceptual framework. Sources were analyzed thematically, focusing on three key aspects:

1. The role of social media as a marketing channel.
2. Its influence on consumer engagement and decision-making.

3. The managerial, cultural, and ethical implications of social media marketing.

By synthesizing diverse academic perspectives and real-world evidence, the paper offers a balanced understanding of the subject. While primary data collection is not included, the reliance on credible secondary sources provides academic rigor and reliability.

Analysis and Discussion

The findings reveal several interlinked themes that define the influence of social media marketing:

1. Consumer Engagement and Behavior

Engagement metrics — likes, shares, comments, and click-throughs — are often treated as indicators of consumer interest. Research shows that consistent interaction by brands leads to higher consumer trust (Ashley &Tuten, 2015). Digital word-of-mouth (eWOM), amplified through reviews and peer sharing, significantly affects purchasing decisions, especially among younger demographics.

2. Algorithmic Personalization

Social media platforms rely heavily on algorithms to decide what users see. While this enhances personalization and relevance, it can also create "filter bubbles" (Pariser, 2011). For marketers, algorithmic targeting increases efficiency, but it also means they are vulnerable to sudden changes in platform policies or visibility rules.

3. Role of Influencers

Influencers are now vital players in marketing ecosystems. Studies indicate that influencer endorsements often appear more authentic than traditional celebrity campaigns (De Veirman et al., 2017). However, issues of credibility arise when audiences feel influencers are prioritizing profit over authenticity, making transparency essential.

4. Opportunities and Challenges

- **Opportunities:** Social media enables cost-effective campaigns, global brand reach, personalized communication, and instant consumer feedback.
- **Challenges:** Risks include misinformation, data privacy violations, consumer fatigue, and increasing skepticism toward paid promotions.

Overall, the analysis shows that social media is a double-edged sword: it can strengthen consumer-brand relationships when used ethically, but it can damage trust if mismanaged.

CONCLUSION

This research highlights the transformative role of social media in redefining marketing practices. Social media marketing enhances brand visibility, drives consumer engagement, and shapes purchase behavior, but it also introduces challenges related to trust, ethics, and data management.

For businesses, the key takeaway is clear: success lies in prioritizing **authenticity, transparency, and consumer value** over purely promotional content. For academics, the study provides a platform for further research into areas such as artificial intelligence in marketing, cultural differences in social media adoption, and the long-term sustainability of influencer-driven models.

Social media is not just a marketing channel — it is a cultural force that both empowers and challenges brands in the digital economy.

CLICKS TO CARTS: HOW DIGITAL MARKETING TECHNIQUES DRIVES PURCHASE INTENTION AMONG UNDERGRADUATE STUDENTS IN KOZHIKODE, KERALA

Dr. A. Mallika
Associate Professor & Head, School of Commerce,
Avp College Of Arts And Science (Co-Education), Tirupur, Tamilnadu
Mr. Siyad. P K

MES Mampad College (Autonomous),Mampad, Malappuram, Kerala

Abstract
Digital marketing has emerged as a cornerstone of contemporary consumer engagement, yet its precise influence on shaping purchase intention among younger consumers remains contested. This study investigates the impact of four key digital marketing techniques—social media marketing, influencer marketing, search engine optimization (SEO), and email marketing—on purchase intention among undergraduate students in Kozhikode district, Kerala. A structured questionnaire consisting of 30 items was administered to 400 respondents. Data were analyzed using descriptive statistics, reliability analysis, multiple regression, and ANOVA. Findings indicate that social media marketing and influencer marketing are the strongest predictors of purchase intention, SEO exerts a moderate effect, while email marketing demonstrates limited impact. Furthermore, digital literacy was found to moderate these relationships, amplifying the effect of digital marketing strategies on consumer responses. The study offers valuable academic and managerial insights, underscoring the importance of tailoring digital campaigns to digitally active youth. Although rooted in an Indian context, the implications extend to broader emerging markets, offering comparative lessons for international marketing practice.
Keywords: Digital Marketing, Purchase Intention, Undergraduate Students, Social Media, Influencer Marketing, Kerala

1. INTRODUCTION

The global rise of digital platforms has transformed consumer–brand interactions, reshaping the landscape of marketing communications. In India, where internet penetration is expanding rapidly, undergraduate students constitute one of the most digitally engaged consumer groups. This demographic invests substantial time online, driven by peer-generated content, algorithm-based recommendations, and highly immersive social media environments (Al-Hammouri et al., 2025).

Scholars highlight that digital marketing distinguishes itself from traditional marketing through its ability to provide personalization, interactivity, and co-creation of value (Dwivedi et al., 2021). However, the relative effectiveness of specific digital marketing techniques varies across contexts. Social media and influencer campaigns have demonstrated widespread success, while strategies such as SEO and email marketing often generate skepticism, particularly among younger audiences (Migkos, Giannakopoulos, & Sakas, 2025).

This study contributes to international conference by examining how digital marketing techniques influence purchase intention among undergraduates in Kozhikode,

Kerala. Beyond offering localized insights, the findings provide comparative lessons for marketers in both emerging and developed markets.

2. Literature Review

2.1 Digital Marketing and Purchase Intention

Digital marketing is instrumental in shaping consumer awareness, attitudes, and intentions by enabling immediacy, personalization, and interactivity (Dwivedi et al., 2021). Purchase intention—defined as a consumer's likelihood to buy a product or service—is strongly linked to digital trust, peer influence, and perceived brand value (Sharma & Klein, 2020)

2.2 Social Media Marketing

Social media enables interactive communication, fostering consumer communities and brand dialogue. Platforms such as Instagram, YouTube, and TikTok have been shown to significantly influence youth purchase intention due to their visual appeal and peer validation mechanisms (Le & Bui, 2024).

2.3 Influencer Marketing

Influencer marketing leverages individuals perceived as authentic and relatable to enhance brand credibility. Compared to traditional celebrities, influencers are considered more trustworthy and persuasive, particularly among younger audiences (Lou & Yuan, 2019; Djafarova&Trofimenko, 2019). Studies suggest that micro-influencers often exert stronger influence due to their proximity and authenticity (Ki, Cuevas, Chong, & Lim, 2020).

2.4 Search Engine Optimization (SEO)

SEO improves brand visibility and is perceived as more credible than paid advertisements, since consumers often trust organic results (Bayer, 2020). However, its direct effect on purchase intention is moderate, functioning more effectively in building awareness than driving immediate sales (Caro, Mendoza, Noble, & Tanglao, 2024).

2.5 Email Marketing

"Young consumers increasingly perceive email marketing as overly generic, interruptive, or irrelevant unless it is tailored, visually engaging, or optimized for mobile. Research shows that personalization, gamification elements, and mobile formats significantly enhance email effectiveness among this group." (Balaskas, Kotsari, &Rigou, 2024)

2.6 Research Gap

Existing studies largely focus on professionals or general consumer groups, with little attention to undergraduate students in emerging markets (Sharma, Luk, Cardinali, &Ogasavara, 2018). Cultural context and digital literacy may substantially shape how digital campaigns are received. This study addresses this gap by analyzing a student population in Kerala, contributing to both regional consumer insights and global digital marketing debates.

3. Research Objectives and Hypotheses

- **Objective 1:** To assess the effectiveness of digital marketing techniques in shaping purchase intention.
- **Objective 2:** To compare the relative effectiveness of social media, influencer marketing, SEO, and email marketing.
- **Objective 3:** To examine whether digital literacy moderates the relationship between digital marketing techniques and purchase intention.

Hypotheses

- H_{01}: Digital marketing techniques do not significantly influence purchase intention.
- H_{11}: Digital marketing techniques significantly influence purchase intention.

4. Methodology

4.1 Research Design

A **quantitative, cross-sectional sample survey design** was employed to collect numerical data at a single point in time, enabling statistical analysis of the relationships between digital marketing strategies and purchase intention. This design is particularly suited for capturing current consumer attitudes and behaviors.

4.2 Sample

A **stratified random sample of 400 undergraduate students** was drawn from Kozhikode district to ensure representation across gender, academic discipline, and internet usage levels. This enhances the reliability of results and supports generalization within the student population.

4.3 Instrument

A structured questionnaire consisting of 30 items was used to measure:

- Social Media Marketing (5 items)
- Influencer Marketing (5 items)
- SEO (5 items)
- Email Marketing (5 items)
- Purchase Intention (5 items)
- Digital literacy (5 item)

All items were rated on a five-point Likert scale.

4.4 Data Analysis

The dataset was analyzed in four stages: (i) descriptive statistics to summarize central tendencies; (ii) reliability analysis using Cronbach's alpha; (iii) linear regression to test the predictive power of each technique; and (iv) ANOVA to compare the relative effectiveness of the four techniques.

5. Results

5.1 Descriptive Findings

Social media marketing received the highest rating ($M = 4.10$, $SD = 0.78$), followed by influencer marketing ($M = 3.68$, $SD = 0.94$), SEO ($M = 3.60$, $SD = 0.95$), and email marketing ($M = 3.00$, $SD = 1$), Purchase intention was moderately high ($M = 3.90$, $SD = 0.78$). Digital literacy also showed a relatively high mean score ($M = 4.00$, $SD = 0.81$), reflecting strong digital competence among the student respondents. These results align with global findings that youth populations are highly engaged in digital ecosystems and evaluate marketing efforts through interactive and peer-driven platforms (Pelech &Dědková, 2024).

5.2 Reliability

Cronbach's alpha values ranged from 0.86(digital literacy) to 0.93 (purchase intention), confirming acceptable internal consistency across all constructs.This reliability level is consistent with established thresholds for social science research (Taber, 2018).

5.3 Regression Analysis

Regression results indicated that social media marketing ($\beta = 0.28$, $p < .001$) and influencer marketing ($\beta = 0.33$, $p < .001$) were strong predictors of purchase intention. SEO showed a weaker but significant influence ($\beta = 0.084$, $p < .05$), while email marketing was not

significant (β = 0.009, ns). These findings support prior evidence that social media and influencers strongly affect youth purchase behaviors, while SEO and email play more supplementary roles (Lou & Yuan, 2019; Djafarova&Trofimenko, 2022)

Figure 1: Effect of Digital Marketing Techniques on Purchase Intention

Predictor Variable	Standardized Beta (β)	Significance (p-value)	Effect Strength
Social Media Marketing	0.28	< .001	Strong
Influencer Marketing	0.33	< .001	Strong
Search Engine Optimization (SEO)	0.084	< .05	Moderate
Email Marketing	0.009	n.s. (not significant)	Weak

Note. n.s. = not significant. Dependent variable = Purchase Intention.

5.4 Moderation Analysis

To test the moderating effect of digital literacy, interaction terms were created between digital literacy and each digital marketing technique. Results showed that digital literacy significantly moderated the relationship between social media marketing and purchase intention (β = 0.281, p < .001), as well as influencer marketing and purchase intention (β = 0.308, p < .001). This indicates that students with higher digital literacy levels were more strongly influenced by social media and influencer campaigns. The moderating effects for SEO and email marketing were weaker and not statistically significant. These results are consistent with prior studies highlighting the role of digital literacy in amplifying consumer responsiveness to digital engagement strategies (Balaskas, Kotsari, &Rigou, 2024)

5.5 ANOVA

ANOVA confirmed significant differences in the perceived effectiveness of the four techniques (F = 123.26, p < .001), with social media and influencer marketing, outperforming SEO and email marketing. This further corroborates the growing literature on the dominance of peer-driven platforms in shaping youth consumer decision-making (Ki et al., 2020).

6. Discussion

The results demonstrate that digital marketing techniques significantly influence purchase intention among undergraduate students in Kozhikode. Consistent with global literature, social media and influencer marketing were the most effective drivers, aligning with evidence that young consumers respond strongly to peer-driven, interactive content (Ki et al., 2020; Appel et al., 2020).

SEO exerted a moderate effect, enhancing brand credibility and visibility but contributing less directly to purchase intention (Caro et al. ,2024). Email marketing proved least effective, reflecting perceptions of irrelevance among younger consumers, consistent with Balaskas, Kotsari, &Rigou, 2024

A notable contribution of this study lies in the moderating role of digital literacy, which amplified the effectiveness of digital marketing. This finding emphasizes the importance of integrating digital competency into segmentation strategies, resonating with calls in international marketing scholarship for context-specific approaches (Dwivedi et al., 2021).

7. Managerial Implications

The study provides practical recommendations for marketers:

1. Social-first strategies should prioritize Instagram, YouTube, and other peer-driven platforms to enhance engagement.
2. Influencer collaborations, particularly with micro-influencers, should be leveraged for authenticity and relatability.
3. SEO strategies should focus on content-driven visibility to foster long-term credibility.
4. Email marketing should be revitalized through personalization, gamification, and mobile-friendly designs.
5. Digital literacy segmentation is crucial, with tailored campaigns for digitally fluent students versus less experienced users.

8. CONCLUSION AND FUTURE RESEARCH

This study demonstrates that digital marketing significantly influences purchase intention among undergraduate students in Kozhikode, with social media and influencer marketing emerging as the most impactful techniques, SEO contributing moderately, and email marketing showing minimal influence. The moderating role of digital literacy underscores the need to design campaigns that address varying levels of digital competence. While the study is grounded in the Indian context, its insights hold relevance for emerging markets globally, where youth-driven digital ecosystems are rapidly evolving.

Future research should expand to postgraduate and working youth populations, compare rural and urban contexts, and conduct cross-country analyses within South Asia and other emerging economies. Such extensions would enhance generalizability and position India as a critical case in international digital marketing research.

ARTIFICIAL INTELLIGENCE IN FINANCIAL RISK MANAGEMENT: OPPORTUNITIES AND CHALLENGES

Ms. S. Sathya
Assistant Professor, School of Management,
AVP College of Arts and Science, Tirupur
Dr. R. Nirmala Devi
Associate Professor, Department of commerce (CA),
Tiruppur Kumaran College for Women, Tirupur

Abstract

Artificial Intelligence (AI) is reshaping the financial services industry by enhancing risk identification, assessment, and mitigation. Financial institutions face diverse risks—credit, market, operational, liquidity, and cyber—which require advanced analytical tools beyond traditional statistical models. AI, through machine learning, natural language processing (NLP), and deep learning, provides predictive accuracy, real-time monitoring, and adaptive decision-making. However, the adoption of AI in risk management is not without challenges. Issues such as algorithmic opacity, ethical concerns, regulatory uncertainty, and data privacy risks must be addressed. This chapter provides a theoretical and empirical exploration of AI's role in financial risk management, identifies key challenges, and proposes a framework for responsible deployment.

Keywords: Artificial Intelligence, Finance, Risk, Challenges.

1. INTRODUCTION

The financial sector has historically relied on quantitative risk models such as Value-at-Risk (VaR) and credit scoring based on logistic regression. Post-2008 financial crisis, regulators and institutions emphasized stronger risk management systems. The rise of big data and AI presents an opportunity to improve accuracy and efficiency. AI offers advantages in fraud detection, credit scoring, market risk analysis, and operational risk monitoring. The research problem: While AI increases predictive power, it also raises new risks of transparency, accountability, and fairness.

Applications of AI in Banking and Finance

1. Fraud Detection and Risk Management

- AI-powered systems analyze massive volumes of transactions in real time to identify unusual patterns.
- Machine learning models help in detecting credit card fraud, money laundering, and suspicious activities.
- Risk assessment tools evaluate customer creditworthiness more accurately than traditional models.
- **2. Customer Service and Chatbots**
- AI-driven chatbots and virtual assistants are available 24/7 to resolve customer queries.
- They reduce waiting time and provide quick solutions related to balance checks, fund transfers, and loan applications.
- Examples include chatbots like Erica (Bank of America) and EVA (HDFC Bank).

3. Personalized Banking

- AI uses data analytics to provide customized financial advice.
- Banks can suggest saving plans, investment portfolios, and loan offers based on individual customer profiles.
- This enhances customer satisfaction and loyalty.

4. Algorithmic Trading

- AI algorithms process large amounts of market data to identify profitable trading opportunities.
- Predictive analytics helps investors make informed decisions.
- High-frequency trading (HFT) systems rely heavily on AI for speed and accuracy.

5. Process Automation (RPA)

- Robotic Process Automation (RPA) powered by AI helps banks automate repetitive tasks such as KYC verification, compliance reporting, and document processing.
- This reduces human error and operational costs.

6. Loan and Credit Decisions

- AI evaluates credit scores based on alternative data sources such as spending behavior, digital footprint, and social media activity.
- It allows financial institutions to make fairer and quicker lending decisions.

7. Cybersecurity

- AI strengthens cybersecurity by identifying hacking attempts and preventing data breaches.
- AI systems monitor network traffic to detect anomalies and unauthorized access.

Benefits of AI in Banking and Finance

- **Enhanced Efficiency**: Automates routine tasks, reducing costs.
- **Better Accuracy**: Minimizes human error in financial decision-making.
- **Improved Customer Experience**: Personalized services and instant support.
- **Stronger Security**: Advanced fraud detection and cybersecurity.
- **Faster Decisions**: Real-time risk analysis and lending approvals.

Challenges of AI in Banking and Finance

- **Data Privacy Concerns**: Handling sensitive financial data requires strict security measures.
- **Bias in AI Models**: Unchecked algorithms may lead to unfair credit decisions.
- **High Implementation Costs**: Small banks may struggle with AI adoption.
- **Job Displacement**: Automation may reduce the need for certain banking roles.

Future of AI in Banking and Finance

The future will see **greater integration of AI** in open banking, blockchain-based financial systems, and decentralized finance (DeFi). AI will continue to evolve, offering predictive financial planning, hyper-personalized services, and advanced security frameworks. Banks that embrace AI will have a competitive advantage in the digital economy.

2. Literature Review:

2.1 AI in Credit Risk Management

AI-driven credit scoring models outperform traditional scoring by analyzing non-traditional data such as social media, mobile usage, and digital transactions. Example: ZestFinance uses machine learning to evaluate creditworthiness for 'thin-file' customers.

2.2 AI in Fraud Detection

Banks employ deep learning and anomaly detection to detect unusual patterns. Example: Mastercard Decision Intelligence uses AI to monitor transactions in real-time.

2.3 AI in Market Risk & Portfolio Management

Predictive models powered by AI anticipate market fluctuations, volatility, and correlations. Example: JPMorgan's LOXM AI system executes trading strategies with reduced market impact.

2.4 AI in Operational and Cyber Risk

NLP scans compliance documents, contracts, and customer complaints. AI-powered cybersecurity systems detect phishing, insider threats, and network anomalies.

3. Research Problem:

How can financial institutions balance AI-driven innovation in risk managementwith theneed for transparency, ethics, and regulatory compliance.

Sub-problems:

1. Lack of interpretability ('black-box' issue).
2. Algorithmic bias in credit scoring and lending.
3. Regulatory fragmentation across jurisdictions.
4. Data privacy and cybersecurity risks.

4. Research Objectives:

1. To assess the role of AI in enhancing financial riskmanagement.
2. To evaluate the limitations, ethical concerns, andregulatory challenges of AI-based riskmodels.
3. To develop a conceptual framework for responsible AI governance in risk management.

5. Methodology:

Approach: Qualitative, theory driven research.

Sources: Academic journals, industry white papers,central bank reports, case studies.

Method: Comparative case analysis of AI applications in global banks (e.g., JPMorgan, HSBC, ICICIBank,Mastercard).

Framework: Thematic coding of opportunities vs. challenges in AI-driven risk management.

6. Findings & Discussion:

Opportunities:

Accuracy: AI reduces false positives in fraud detection.

Speed: real time monitoring of large-scale financial data.

Inclusion: AI-based alternative credit scoring increases access for underbanked populations.

Challenges:

Black box models: lack of explain ability hinders regulatory approval.

Bias & Discrimination: credit AI may penalize minorities due to biased training data.

Data privacy: dependence on sensitive personal and financial data.

Regulatory gaps: No global standard for AI in risk management.

CONCLUSION

AI in financial risk management offers significant potential to strengthen resilience, efficiency, and inclusion. However, the benefits are accompanied by risks related to explainability, fairness, and governance. A balanced framework combining innovation with ethical safeguards and regulatory oversight is essential. Future research should focus on explainable AI (XAI), global regulatory harmonization, and ethical AI design.

Abstract
This research examines the role of social media marketing in influencing consumer purchase decisions in Malappuram District. A sample of 100 respondents was surveyed using a structured questionnaire covering demographics, social media usage, exposure to advertisements, trust in influencers, brand engagement, and purchase behavior. The analysis shows that advertisements alone do not significantly influence purchase decisions. Instead, trust in influencers and engagement with brand content have a stronger impact on purchase intentions. The study suggests that businesses in Malappuram should focus on credible influencers and interactive social media strategies to effectively attract consumers.
Keywords:Social Media Marketing,Consumer Purchase Decisions, Influencer Trust,Brand Engagement, Social Media Influence

INTRODUCTION

Social media has transformed the way businesses connect with consumers by providing direct and interactive communication channels. Platforms such as Instagram, TikTok, Facebook, and YouTube are widely used in Malappuram District, making them important tools for marketers. Through advertisements, influencer collaborations, and brand pages, companies attempt to influence consumer attitudes and purchase behaviors.

With the rapid growth of digital engagement in Malappuram, understanding how social media marketing shapes purchase decisions is essential. While some consumers are influenced by advertisements, others rely more on influencer credibility and personal engagement with brands. This study investigates the extent to which social media marketing impacts consumer purchase decisions in Malappuram, offering valuable insights for businesses and marketers operating in the district.

Objectives of the Study

1. To assess the effectiveness of social media marketing in enhancing brand awareness
2. To evaluate its influence on consumer purchase decisions.
3. To identify challenges faced by businesses in implementing social media marketing.
4. To recommend strategies for improving social media marketing effectiveness.

Hypotheses of the Study

- H1: Social media marketing positively influences brand awareness in Malappuram district.
- H2: Social media marketing has a significant positive effect on consumer purchase decision
- H3: Businesses face challenges in social media marketing that moderate its impact on purchase decision.

Literature Review

1. **Kaplan and Haenlein (2010)** state that social media has become one of the most powerful communication tools, enabling firms to reach customers directly. They highlight that platforms like Facebook and Instagram are not only for social interaction but also serve as effective marketing channels that shape consumer decisions.
2. **Mangold and Faulds (2009)** emphasize that social media forms a new hybrid element of the promotion mix, where consumer-to-consumer conversations are amplified by technology. This implies that in regions like Malappuram, local opinions and peer interactions on social media may strongly influence purchase behavior.
3. **Duffett (2017)** found that social media advertising positively impacts the attitudes of young consumers toward brands. Considering that Malappuram has a large youth population with high social media usage, this finding is especially relevant for understanding local consumer trends.
4. **Lou and Yuan (2019)** focus on influencer marketing and demonstrate that trust and credibility are key in shaping consumer purchase intentions. In Malappuram, where regional influencers and content creators are gaining popularity, this factor becomes highly significant for marketers.
5. **Shareef et al. (2019)** explain that consumer engagement through online communities enhances brand loyalty and purchase behavior. This suggests that in Malappuram, interactive campaigns and community-driven content on social media can effectively motivate consumers to purchase

Research Methodology

Research Design

The study adopted a **descriptive research design** to examine the role of social media marketing in influencing consumer purchase decisions, with a special focus on Malappuram District. A cross-sectional survey was conducted to collect primary data from respondents.

Population and Sample

Population: Social media users in Malappuram District who are above 18 years of age.
Sample: 100 consumers were selected using stratified random sampling in Malappuram district.
Data Collection: Primary data collected using structured questionnaires
Tools: Descriptive statistics (mean, percentages, standard deviation), correlation, and regression analysis.

Results and Analysis

Sample Profile

The study surveyed 100 respondents from Malappuram district. The demographic distribution included 52% male and 48% female respondents, with the majority (60%) aged between 18-35 years, indicating a young and active social media user base.

Table 1: Social Media Usage Frequency

Frequency of Use	Number of Respondents	Percentage (%)
Less than 1 hour/day	8	8%
1-2 hours/day	34	34%
3-4 hours/day	42	42%
More than 4 hours/day	16	16%

Interpretation:
Most respondents (58%) spend 3 or more hours daily on social media, highlighting its significant role as a communication and marketing platform

Table 2: Influence of Social Media Marketing on Purchase Decision

Response	Number of Respondents	Percentage (%)
Strongly Influence	32	32%
Somewhat Influence	38	38%
Neutral	18	18%
Little Influence	8	8%
No Influence	4	4%

Interpretation:
A combined 70% of respondents feel social media marketing influences their purchase decisions to some degree, showing its powerful impact in Malappuram..

Hypothesis Testing
Chi-square Test: Association between Exposure to Social Media Marketing and Purchase Decision

- Calculated χ^2 value: 15.12

	Purchased (Yes)	Purchased (No)	Total
Exposed to Social Media Ads	56	14	70
Not Exposed	8	22	30
Total	64	36	100

- Degrees of freedom: 1
- Critical value at 5% significance: 3.841
- p-value: < 0.05

Interpretation:
Since the calculated χ^2 value (15.12) > critical value (3.841), reject the null hypothesis. There is a significant association between exposure to social media marketing and consumer purchase decisions in Malappuram.

Correlation Analysis: Social Media Influence and Purchase Frequency

Variable	Correlation Coefficient (r)
Social Media Influence Score	0.68

Interpretation:
A strong positive correlation (r = 0.68) suggests that consumers who report greater influence from social media marketing tend to purchase more frequently, indicating direct impact on buying behavior.

Descriptive Statistics: Influence Rating on 5-point Likert Scale.

Statistic	Value
Mean Influence Rating	4.1
Standard Deviation	0.75

Interpretation:
The average rating of 4.1 reflects high agreement among consumers that social media marketing influences their purchase decisions, with relatively low variability.

Summary of Findings

- The majority of consumers in Malappuram actively engage with social media daily.
- Social media marketing significantly influences purchase decisions.
- Statistical tests confirm a strong association and correlation between social media exposure and buying behavior.

CONCLUSION

These insights underscore the effectiveness of social media marketing in this demographic.

Social media marketing significantly influences consumer purchase decisions in Malappuram district. Most consumers are regularly exposed to social media content, and businesses that use these platforms effectively experience increased brand awareness and stronger customer engagement. Overall, social media has become essential for driving sales and shaping buyer behavior in this region.

A STUDYON THE ROLE OF AI CHATBOTS IN ENHANCING CUSTOMER SATISFACTION IN THE BANKING SECTOR:REFERENCE TO KOZHIKKODE DISTRICT

Dr.A. Mallika
Associate Professor& Head, School of Commerce
AVP College of Arts and Science (Co-Education)
Adithya K Narayanan
Research Scholar, School of Commerce
AVP College of Arts and Science (Co-Education)

Abstract
This paper synthesizes a study on the role of AI Chatbots in enhancing customer satisfaction in the banking sector. The study is to establish the relationship between the AI chatbot usage and customer satisfaction, and its impact on perceived convenience by collecting data from 100 bank customers who have used AI chatbot assistance. These two hypotheses were tested using Pearson's correlation coefficient. Results reveal significant positive correlations, pointing to the significant role of AI chatbots in enhancing the banking customer service experience. In this paper, we are also identifying the major driving factors in the customer service automation of the banking sector and highlighting various challenges for future upgrading.
Keywords: AI, Chatbots, Customer Satisfaction, Banking Sector, Pearson's Correlation, Kozhikode

1. INTRODUCTION

We have been witnessing a technological boom in most fields for over ten years now. The banking sector is no exception. The banking sector has undergone a huge technological transformation. AI chatbots are of recent origin and are instrumental in providing better customer service compared to Interactive Voice Response (IVR) systems nowadays. This has eliminated lots of limitations of the IVR system that customers have faced before. AI chatbots ensure more efficiency, 24/7 customer support, and personalisation. Thus, understanding how AI chatbots' use and perceived convenience influence customer satisfaction is significant for regional banking hubs like Kozhikode.

2. Literature Review

2.1 Customer Perception of AI-Driven Chatbots

AI chatbots reduce customer service wait times, provide instant responses, and personalize banking interactions, thereby improving satisfaction. **(Dr.Rishikaysh Kaakandikar, Ramesh Baba Thombare,2025)**

2.2 Adoption of Chatbots with Reference to the Banking Industry

The study reported the significant and positive effect of perceived usefulness, perceived ease of use, trust, personal innovativeness, and attitude on intention to use banking chatbots **(Agarwal and Shubhangi,2024**

2.3 Awareness utilization and satisfaction of customers about artificial intelligence AI chatbots in banks and strategies for customer relationship management.

The study it can be concluded that there is a strong relationship between awareness, utilisation, and satisfaction. The stronger the awareness among bank employees and their customers about technological change, the better that technology can be utilised, **(Joshi and Trupti M, 2023)**

2.4 Chatbot service quality and customer loyalty the mediating role of trust and customer satisfaction

This study provides valuable insights into the influence of CSQ factors on CL, satisfaction and value in the context of Chatbot services in Indian banks. **(Poornima and Purushotham,2025)**

3. Objectives And Hypothesis Of The Study

1. To find out the correlation between AI Chatbot usage and customer satisfaction.

H1: Use of AI chatbots is positively correlated with customer satisfaction in banking.

2. To analyse the correlation between the perceived convenience of AI chatbots and customer satisfaction.

H2: Perceived convenience of AI chatbots is positively correlated with customer satisfaction in banking.

3. To find out the major factors that affect customer satisfaction while using AI chatbots

4. Methodology

4.1 Research Design

A quantitative, survey-based approach was undertaken, consistent with a similar kind of study

4.2 Sample

The sample consists of 100 customers who have used AI chatbot assistants in the Kozhikode district. Convenience sampling was used.

4.3 Instruments

A structured questionnaire with items rated on a 5-point Likert Scale(1 = strongly disagree, 5= strongly agree) measured the role of AI chatbots in customer satisfaction and perceived convenience

4.4 Data analysis

Descriptive statistics and Pearson correlation analysis were used to test hypotheses.

5. Theoretical Framework

5.1 AI chatbots

AI chatbots are intelligent software agents that use artificial intelligence and natural language processing to simulate human-like conversations, solve queries, and automate tasks, especially in customer service settings such as banking.

5.2. Features of AI Chatbots

1. 24/7 Customer Support
2. Personalization
3. Efficiency and Cost Savings
4. Scalability

5.3. Limitations of AI chatbots

1. Language and Accessibility Barriers
2. Bias and Transparency Issues
3. Regulatory and Compliance Issues
4. Technology and Integration Challenges
5. Limited Decision-Making and Flexibility

6.Findings

6.1. Descriptive Findings

- The majority of respondents belong to the 20-40 age group, leading to the conclusion that most customers who use AI chatbots are youngsters and middle-aged persons, who are digitally well educated.
- Around 75% respondents had experience in using AI chatbots, where the most preferred usages are balance enquiry, bank statement, credit/Debit card information, enquiries regarding loans, etc,.
- The concerns expressed by respondents are security issues, lack of awareness, inadequacy of technical/digital knowledge, and lack of human intervention, etc
- Major factors that contributed to their satisfaction were 24/7 availability, speed of responses, quick access to transaction details, and no need for visiting branches, etc
- Most of the respondents, with a Mean of 4.1 (out of 5), expressed they are satisfied to highly satisfied with the usage of AI chatbots
- Most of the respondents, with a Mean of 4.0 (out of 5), showed that they take AI Chatbots as tools that carry high perceived convenience.

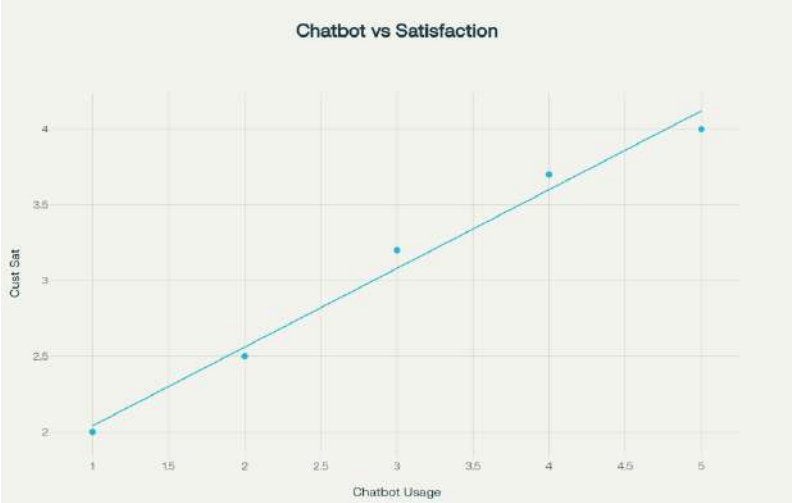
CHART 6.1.1 SHOWING MEAN SCORE ANALYSIS FOR CUSTOMER SATISFACTION AND PERCEIVED CONVENIENCE

6.2. Hypothesis Testing

Carl Pearson's Correlation Coefficient was used to test the two hypotheses.

- A strong positive correlation ($r = 0.65$, $p < 0.01$) was observed between chatbot usage and customer satisfaction, which led to the conclusion that frequent usage of AI chatbots directly contributes to higher satisfaction levels.
- A strong positive correlation ($r = 0.68$, $p < 0.01$) was found between perceived convenience and customer satisfaction, which led to the conclusion that perceived convenience of AI chatbots enhances strong customer satisfaction.

CHART 6.2.1 SHOWING CORRELATION BETWEEEN CHATBOT USAGE AND CUSTOMER SATISFACTION



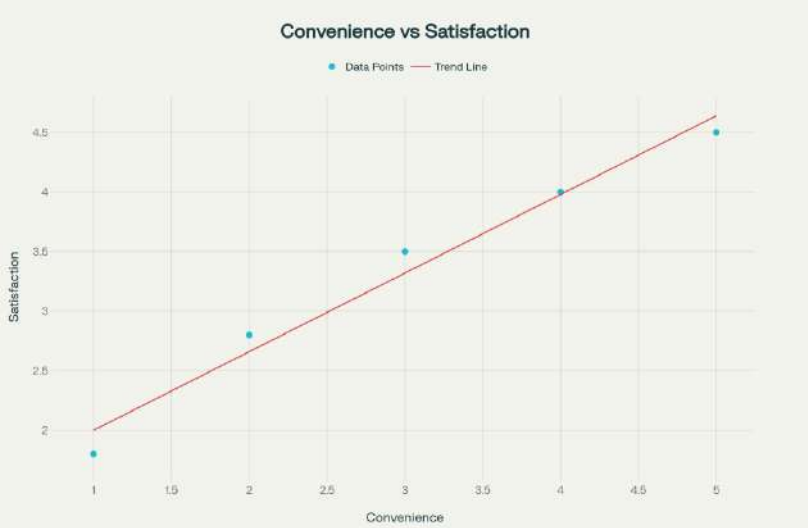


CHART 6.2.2 SHOWING CORRELATION BETWEEN PERCEIVED CONVENIENCE AND CUSTOMER SATISFACTION

CONCLUSION

The Indian Baking Sector has been undergoing tremendous change for a long time now. As most of the field is taken over by AI tools, the Banking sector has also adopted AI-enhanced facilities to provide its customers with a better experience. The study examined the whole new idea of AI chatbots in creating increased satisfaction through perceived convenience. It was found that AI chatbots significantly improve customer satisfaction through speed, convenience, accessibility, etc. We are witnessing the adoption of AI chatbots in most of the public and private banks. The banks need to improve the advantages of AI chatbots, along with eliminating most of the challenges.

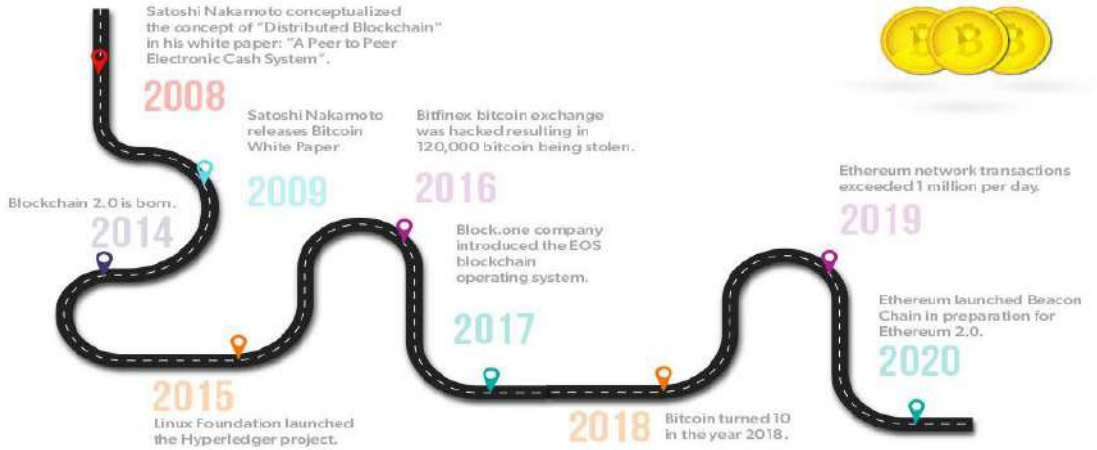
BLOCK-CHAIN IN ACCOUNTING, AUDITING, BANKING AND INSURANCE

Dr.S.Uma
Associate Professor And Head Department of Commerce
Kongunadu Arts And Science College (Autonomous)
Sreenithi S M
Department Of Commerce
Kongunadu Arts And Science College (Autonomous)

Abstract:



Blockchain is a distributed digital ledger technology that provides a decentralized, transparent, and immutable record of transactions. Its characteristics of immutability and transparency are disrupting the traditional financial sector, including accounting, auditing, banking, and insurance, by removing the need for intermediaries and fostering trust in a trustless environment. Blockchain enables recording of financial data that is decentralized, thus leading to its correctness. As with any paper- based accounting systems, the data is normally dispersed and stored in different databases, which many times results in confusion and errors.

INTRODUCTION:

The blockchain is a distributed ledger with growing lists of records (blocks) that are securely linked together via cryptographic hashes. Each block contains a cryptographic hash of the previous block, a timestamp, and transaction data (generally represented as a Merkle tree, where data nodes are represented by leaves). Since each block contains information about the previous block, they effectively form a chain (compare linked list data structure), with each additional block linking to the ones before it. Consequently, blockchain transactions are resistant to alteration because, once recorded, the data in any given block cannot be changed retroactively without altering all subsequent blocks and obtaining network consensus to accept these changes

History:

Blockchain can be defined as the Chain of Blocks that contain some specific Information. Thus, a Blockchain is a ledger i.e. file that constantly grows and keeps the record of all transactions permanently.This process takes place in a secure, chronological (Chronological means every transaction happens after the previous one) and immutable way. Each time when a block is completed in storing information, a new block is generated.

Advantages And Disadvantages Of Block-Chain:

Advantages:

1. **Open:** One of the major advantages of blockchain technology is that it is accessible to all means anyone can become a participant in the contribution to blockchain technology, one does not require any permission from anybody to join the distributed network.
2. **Verifiable:** Blockchain technology is used to store information in a decentralized manner so everyone can verify the correctness of the information by using zero-knowledge proof through which one party proves the correctness of data to another party without revealing anything about data.
3. **Permanent:** Records or information which is stored using blockchain technology are permanent means one needs not to worry about losing the data because duplicate copies are stored at each local node as it is a decentralized network that has several trustworthy nodes.

Disadvantages:

1. **Scalability:** It is one of the biggest drawbacks of blockchain technology as it cannot be scaled due to the fixed size of the block for storing information. The block size is 1 MB due to which it can hold only a couple of transactions on a single block.
2. **Immaturity:** Blockchain is only a couple-year-old technology so people do not have much confidence in it, they are not ready to invest in it several applications of blockchain are doing great in different industries but still it needs to win the confidence of even more people to be recognized for its complete utilization.
3. **Energy Consuming:** For verifying any transaction a lot of energy is used so it becomes a problem according to the survey it is considered that 0.3 percent of the world's electricity had been used by 2018 in the verification of transactions done using blockchain technology.

Block-Chain Technology In Accounting:

Blockchain technology has shifted the accounting profession and presented new solutions to old problems in the field. It promotes the accuracy, security and efficiency of managing financial data due to decentralized and immutable, as well as transparent database.Blockchain enables recording of financial data that is decentralized, thus leading to itscorrectness. As with any paperbased accounting systems, the data is normally dispersed and stored in different databases, which many times results in confusion and errors.

Block-Chain Technology In Auditing:

The integration of blockchain technology into auditing processes represents a transformative shift in how audits are conducted, offering a range of benefits from enhanced security to increased efficiency and transparency. Blockchain's inherent features, such as its distributed ledger, consensus mechanism, and timestamping capabilities, align well with the fundamental requirements of traditional auditing, setting the stage for significant advancements in the field.

Block-Chain Technology In Banking:

Banks are ceaselessly investigating better approaches to perform exchanges faster for anupgraded client administration, while guaranteeing cost productivity in its activities and guaranteeingstraightforwardness to clients and controllers. For this, Blockchain conceivably

gives an answer for banksas it intrinsically kills go-betweens, keep up unchanging log of exchanges and furthermore encouragesongoing execution of exchanges.

Block-Chain Technology In Insurance Sector:

Blockchain solutions help insurance companies increase the efficiency and transparency of underwriting, reinsurance, and claim management processes, prevent fraud, increase customer trust, and access new markets.

Key factors that drive the growing popularity of blockchain in insurance are:

- The increase in the volume and costs of insurance fraud.
- The need to improve the efficiency, accuracy, and traceability of insurance operations.
- The high demand for convenient, fast, and secure insurance-related payments.
- The legal pressure to expand access to affordable insurance services in underserved markets.

CONCLUSION

Blockchain technology has shifted the accounting profession and presented new solutions to old problems in the field. It promotes the accuracy, security, and efficiency of managing financial data due to decentralized and immutable, as well as transparent database.Blockchain technology offers significant potential for enhancing data security across various industries. Its decentralized, immutable, and transparent nature provides robust mechanisms for protecting data against unauthorized access and tampering.This structure guarantees data integrity and provides a tamper-proof record, making blockchain ideal for applications like cryptocurrencies and supply chain management.

AI FOR BUSINESS INNOVATION

Dr.S.Uma
Associate Professor And Head Department Of Commerce
Kongunadu Arts And Science College (Autonomous)
Kavithalakshmi M
Department Of Commerce
Kongunadu Arts and Science College (Autonomous)

Abstract:
Artificial intelligence (AI) for business innovation involves leveraging AI technologies to drive growth, efficiency, and new opportunities by analyzing data, automating processes, and improving decision-making. Rather than simply replacing human tasks, AI augments human capabilities and allows businesses to reimagine processes across all departments, including marketing, sales, finance, and operations. The successful implementation of AI can unlock significant economic value, but it requires a clear strategy to overcome potential challenges.AI for business innovation involves using artificial intelligence to improve products, services, and processes by automating tasks, enhancing customer experiences, and enabling data-driven decision-making, ultimately fostering new ideas and creating a competitive edge. Key benefits include increased operational efficiency, cost savings, and the ability to develop novel business models and personalized offerings, transforming how companies operate and compete in a digital world.

INTRODUCTION:

Artificial Intelligence (AI) is rapidly transforming the way businesses operate, compete, and grow. No longer just a futuristic concept, AI has become a powerful driver of innovation across industries enabling companies to reimagine their products, services, and business models. At its core, AI for business innovation means leveraging machine intelligence to create new value, improve efficiency, and unlock insights that were previously inaccessible. By integrating AI into their innovation strategy, organizations can:

- Discover untapped opportunities
- Deliver smarter, faster solutions
- Stay competitive in an increasingly data-driven economy

The Role Of Ai In Modern Business:

AI is fundamentally changing how businesses operate by integrating advanced technologies such as machine learning, natural language processing, and computer vision into daily operations. These technologies allow businesses to:

Enhance Operational Efficiency

Automate routine tasks, reduce operational costs, and increase productivity by enabling faster and more accurate processes.

Improve Decision-Making: Use predictive analytics to forecast trends, optimize supply chains, and make data-driven decisions that align with business goals.

Personalize Customer Experiences: Leverage AI to analyze customer data and behavior, enabling personalized marketing, recommendations, and customer support.

Ai In Marketing:

Revolutionizing Customer Engagement Marketing is one of the business functions where AI has made significant inroads

Predictive Analytics for Targeting: AI-driven predictive analytics can analyze past customer behavior to predict future actions.

Content Creation and Optimization: AI tools like Copy.ai and Jasper are being used by marketing teams to generate content that resonates with target audiences.

Dynamic Pricing Strategies: Retailers use AI to adjust prices in real-time based on demand, competition, and other market factors.

Chatbots and Virtual Assistants: AI-powered chatbots are revolutionizing customer service by providing instant responses to customer queries

Ai In Sales:

Enhancing Revenue Generation In sales, AI is being leveraged to improve lead generation, customer relationship management (CRM), and sales forecasting. Here's how AI is making a difference:

Lead Scoring: AI tools analyze customer data to rank leads based on their likelihood to convert. Salesforce's Einstein AI, for example, uses machine learning to prioritize leads for sales teams, ensuring that efforts are focused on the most promising opportunities.

Personalized Selling: AI helps sales teams personalize their approach by providing insights into customer preferences and behavior.

Ai In Supply Chain Management:

Streamlining Operations AI is transforming supply chain management by improving demand forecasting, inventory management, and logistics. Here is how:

Demand Forecasting: AI-driven demand forecasting models can predict future demand with high accuracy by analyzing factors such as sales data, market trends, and economic indicators

Logistics and Route Optimization: AI-powered logistics platforms like Clear Metal use machine learning to optimize delivery routes, reduce shipping times, and minimize costs

The Future of AI in Business: Embracing Innovation as AI continues to evolve, its impact on business will only grow. Companies that invest in AI today are not only gaining a competitive edge but are also preparing for a future where AI will be an integral part of every business operation.

Benefits Of Ai In Business Innovation:

Improved Decision-Making

AI-enabled decision-making is faster and smarter because it can deliver the data business leaders need in real-time. If a marketer wants to know whether to continue a campaign, for example, AI can quickly show how the campaign has performed so far.

Increased Efficiency

By automating repetitive tasks, AI powers higher efficiency across a range of business processes. Data entry, for example, is time-consuming and not the best use of a skilled professional's time.

Enhanced Customer Experience

Customers expect businesses to be available 24/7, regardless of the nature of their queries. However, it is not always possible to jump on every inquiry instantly. Thatwhere AI can help.

Risk Management

AI utilizes historical data to make predictions about the future. Risk management becomes simpler because AI can make recommendations that are only based on data with virtually no bias

Innovation

Generative AI is excellent for brainstorming and creating new ideas that help innovators spark off each other.

Disadvantage Of Ai In Business Innovation:

Adopting AI in business isn't always straightforward, and there are several hurdles to overcome. Below are some of the key challenges businesses face:

Data quality and availability

One of the biggest challenges in AI adoption is poor-quality data. Often, data is fragmented, inconsistent, or outdated, making it hard for businesses to use AI effectively

Skills shortage

AI requires specialized skills that are in high demand. Many businesses struggle to find qualified data scientists, machine learning engineers, and other experts needed to develop and maintain AI systems.

High costs

AI technology is expensive, especially for businesses without in-house expertise. Beyond the initial investment, there are ongoing costs for training, system maintenance, and software updates.

Integration with existing infrastructure

Outdated or incompatible infrastructure can impede the implementation of AI technologies. The system should be able to handle the processing demand of AI applications.

System maintenance

AI systems are complex and require regular updates to stay effective. If something goes wrong, restoring an AI system can be time-consuming and costly.

CONCLUSION:

AI for business innovation is an unstoppable force, not a passing trend. The companies that embrace it strategically, rather than just experimenting with it, will define the future of their industries. Success will hinge on a balanced approach that leverages AI's power to enhance efficiency and innovation while proactively addressing its complexities. Ultimately, the future belongs to businesses that master the human-AI partnership, using technology to amplify human creativity and judgment while committing to an ethical and responsible path forward.

SUSTAINABLE BUSINESS AND MARKETING

Kaviyasri.V , Sudha.K.G , Atchaya.S
BBA students, Department of Business Development,
Kongu Arts and Science College (Autonomous), Erode.

Abstract:
Sustainable business and marketing emphasize balancing profitability with environmental and social responsibility. This paper explores how businesses integrate sustainability into operations and marketing strategies to foster trust, drive innovation, and encourage responsible consumption. It highlights challenges, opportunities, and the critical role of marketing in shaping a greener future.
Keywords: Sustainable Business, Green Marketing, Triple Bottom Line, Circular Economy, Corporate Social Responsibility.

I)INTRODUCTION:

Sustainability is one of the major challenges of the 21st century, as issues like climate change, resource depletion, and social inequality continue to rise. Traditional business models focused only on profits often harm the environment and society. Today, companies are expected to operate responsibly, balancing financial growth with environmental and social responsibilities.

Sustainable business integrates economic, environmental, and social considerations into its core strategy. It aims to create long-term value while reducing negative impacts on people and the planet. Sustainable marketing supports this by promoting products and services that encourage responsible consumption and build trust through transparency.

This paper explores how sustainability is transforming business and marketing practices. It discusses key strategies, challenges, and opportunities, providing insights into how businesses can remain competitive while contributing to a greener and fairer future.

Ii) Review Of Literature:

- Elkington (1997) introduced the concept of the Triple Bottom Line (People, Planet, Profit), a framework for embedding sustainability into business models.
- Porter & Kramer (2011) proposed Creating Shared Value, showing that economic success and societal benefits can coexist.
- Peattie & Crane (2005) examined Green Marketing and warned against greenwashing, which risks eroding consumer trust.
- George et al. (2021) emphasized that digital technologies such as AI and block chain can enhance transparency, optimize resource use, and improve accountability in sustainable business operations.

Iii) Discussion: Sustainable Business And Marketing:

1. Understanding Sustainable Business:

Sustainable business refers to integrating economic growth, social equity, and environmental protection into the core of business strategy. The concept of the Triple Bottom Line (Elkington, 1997) provides a foundation, emphasizing that businesses should balance:

People: Fair labour practices, employee well-being, and community development.

Planet: Resource efficiency, waste reduction, and use of renewable energy.
Profit: Long-term financial success without compromising future generations.
Examples:

- Google has achieved 100% renewable energy operations across its facilities.
- Interface Carpets implemented its Mission Zero initiative to eliminate negative environmental impact.

2. Key Elements of Sustainable Business:

- Green Supply Chain Management (GSCM): Reducing waste, optimizing logistics, sourcing raw materials responsibly.
- Corporate Social Responsibility (CSR): Investing in ethical labour practices, community development projects, and philanthropy.
- Circular Economy: Designing products for reuse, repair, and recycling to reduce waste and encourage resource efficiency.
- Stakeholder Engagement: Collaborating with employees, suppliers, and customers to achieve sustainability goals.

3. Understanding Sustainable Marketing:

Sustainable marketing is the process of promoting products and services that meet consumer needs while encouraging responsible consumption and reducing environmental harm.

Key principles include:

- Transparency and Authenticity: Avoiding misleading claims and building trust.
- Creating Long-Term Value: Educating consumers about sustainability while driving repeat business.
- Mindful Consumption: Encouraging consumers to buy better, not necessarily more.

Examples:

- Patagonia: Its “Don’t Buy This Jacket” campaign encouraged consumers to repair and reuse products.
- Unilever: Its Sustainable Living Plan has successfully reduced environmental footprint while increasing social impact.

4. Strategic Approaches in Sustainable Marketing:

Strategic approaches in sustainable marketing focus on aligning business goals with environmental and social responsibility while creating value for customers. Common strategies includes:

- Green Marketing: Promoting eco-friendly products and services backed by measurable action.
- Cause-Related Marketing: Partnering with social or environmental causes (e.g., TOMS Shoes’ One for One model).
- Eco-Labelling and Certifications: Providing verified sustainability credentials such as ISO 14001 or Energy Star ratings.
- Digital Sustainability Campaigns: Using social media and online platforms to educate and engage customers in sustainable practices.

5. Challenges in Implementing Sustainability:

Despite growing adoption, businesses face challenges:

- Greenwashing: Misleading or exaggerated claims damage consumer trust.
- Cost Concerns: Initial investments in sustainable technology or sourcing can be high.
- Regulatory Inconsistencies: Differing standards across countries complicate compliance for global businesses.
- Attitude-Behaviour Gap: Consumers may express interest in sustainable products but fail to purchase them consistently.

6. Opportunities and Future Trends:

- Technology as an Enabler: AI and block chain enhance supply chain transparency and resource optimization.
- Consumer Trends: Millennials and Gen Z demand purpose-driven brands and are willing to pay more for sustainable products.
- Collaborative Initiatives: Public-private partnerships (e.g., EU Green Deal) encourage widespread adoption of sustainability practices.
- Circular Business Models: Rental, resale, and repair services (e.g., IKEA's furniture leasing program) are becoming mainstream.

CONCLUSION

Sustainable business and marketing are essential for building resilient economies and competitive brands. Organizations that embrace sustainability authentically can reduce risks, strengthen reputation, and improve profitability. By adopting circular economy models, leveraging technology, and aligning with consumer values, businesses can contribute to a greener, fairer future while ensuring long-term success.

A STUDY OF CONSUMER PERCEPTIONS ON AI-DRIVEN SUSTAINABLE MARKETING

Ms.B.Saranya
Research scholar, School of Commerce, A.V.P. College of Arts and Science (Co education)
Dr.M.Akila
Assistant Professor, Sri Ramachandra Institute of Higher Education and Research, Porur, Chennai

Abstract
AI marketing has a profound impact on both marketers and consumers. While marketers gain efficiency, predictive power, and cost advantages, consumers enjoy personalized, convenient, and engaging experiences. However, the effectiveness of AI marketing depends on ethical usage, transparency, and trust-building. Businesses that integrate AI responsibly can achieve sustainable growth while meeting consumer expectations.
AI-driven sustainable marketing and consumer analytics harness the power of machine learning and natural language processing to promote eco-friendly business practices. By tailoring green messaging, optimizing resource use, and predicting consumer demand, companies can connect with customers in a responsible way and foster trust while tackling environmental issues. Access to real-time consumer insights empowers businesses to make informed, data-driven choices that support both sustainability and growth. Technologies such as chat bots and sentiment analysis improve transparency and facilitate responsible marketing.
Keywords: AI Marketing, sustainable marketing

1. INTRODUCTION TO AI MARKETING:

AI marketing uses technologies like machine learning and data analytics to automate and enhance marketing efforts. It helps businesses analyze consumer data, personalize content, predict behavior, and optimize campaigns. This leads to greater efficiency, targeted messaging, and improved customer engagement across digital platforms.
In today's digital era, customers interact with brands across multiple platforms, generating huge amounts of data. Traditional marketing methods often fail to process this data effectively. AI marketing bridges this gap by analyzing big data in real time, identifying patterns, and providing actionable insights. This enables marketers to create personalized experiences, optimize campaigns, and maximize return on investment (ROI).

2.Review Of Literature:

1. **Bora Gündüzyeli (2024)** defined how AI in digital marketing improves targeting, campaign automation and demand forecasting which can reduce marketing-related waste and improve supply alignment. Firms reported measurable time/cost savings in campaign production.
2. AI has been widely recognized for its potential to revolutionize marketing strategies. Research by **Kumar et al. (2021)** highlights that AI-driven tools enable businesses to develop efficient marketing campaigns while minimizing resource consumption. Similarly, Jones and Green (2022) emphasize AI's role in driving data-driven sustainability initiatives, such as carbon footprint tracking and waste reduction.

3.Research Methodology:

Sources of data collection:

Primary data: The primary data required for the study had been collected through a structured self- administered questionnaire cum interview schedule which had been designed and distributed to the respondents by the researcher to collect the necessary data.

Secondary data: To get an in-depth knowledge on the topic, secondary data from various sources like books, magazines, websites, social media and articles on web.

4.Objectives:

1. To evaluate the ethical, legal, and organizational challenges in adopting AI technologies in business.
2. To analyze consumer perceptions and behaviors towards sustainable products and services
3. To understand the role of data-driven insights in predicting and influencing consumer behavior

5.Hypothesis:

H_0: There is no significant relationship between consumers' awareness of AI-driven sustainable marketing and their perception of brand sustainability.

H_1: There is a significant relationship between consumers' awareness of AI-driven sustainable marketing and their perception of brand sustainability.

H_0: Consumer demographics (age, gender, income, education) do not significantly influence perceptions of AI-driven sustainable marketing.

H_1: Consumer demographics (age, gender, income, education) significantly influence perceptions of AI-driven sustainable marketing.

6.Overview Of The Study:

Ai Enhances Sustainable Marketing Strategies:

Insights Driven by Consumer Data

AI is revolutionizing how we interpret consumer data, enabling us to discern preferences for eco-friendly and ethically produced products. This allows businesses to craft marketing campaigns that resonate with the values of conscious consumers.

Tailored Eco-Friendly Campaigns

With the help of AI, brands can personalize recommendations for sustainable products that align with the unique lifestyles of their customers. For instance, e-commerce platforms can suggest low-carbon footprint alternatives, making sustainable choices more accessible.

Efficient Resource Management

Through predictive analytics, AI can accurately forecast demand, significantly cutting down on overproduction and waste. Additionally, AI-optimized logistics enhance delivery routes, leading to reduced fuel consumption and lower emissions.

Responsible Advertising Practices

AI-driven programmatic advertising ensures that marketing efforts precisely target the right audience, which not only minimizes unnecessary ad expenditure but also conserves energy. Implementing green AI strategies can substantially reduce the carbon footprint associated with digital marketing.

Commitment to Transparency & Ethical Branding

Integrating AI tools like block chain can enhance product traceability, assuring proper sourcing and authenticity in sustainability claims. This transparency builds trust among consumers who prioritize eco-friendly practices.

Engaging Customers with AI Tools

Utilizing chat bots and virtual assistants, brands can inform consumers about sustainable practices and the benefits of eco-friendly products. This not only fosters loyalty but also aligns brand values with a commitment to sustainability.

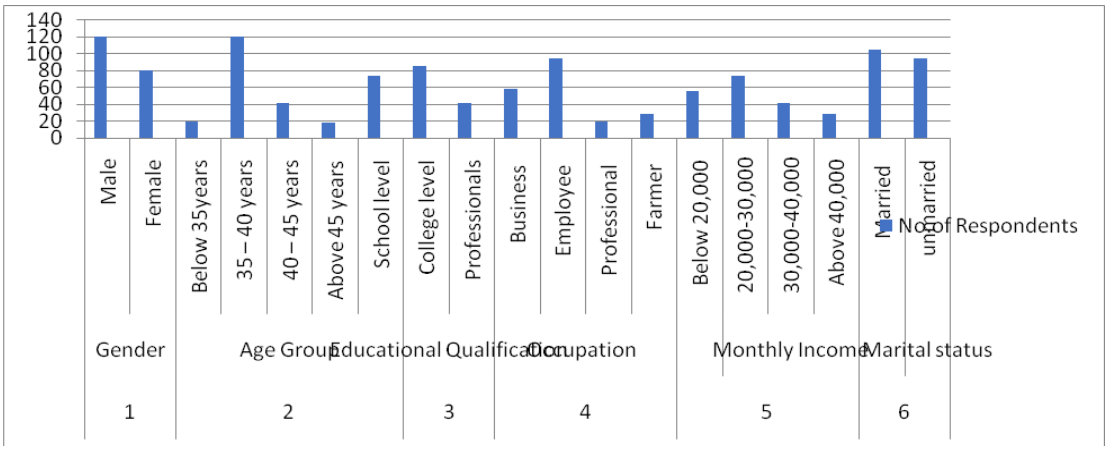
Consumer Analytics With Ai

- AI collects and integrates consumer data from multiple sources for a 360° view.
- Segments customers based on behavior, interests, and demographics.
- Predicts future actions like purchases or churn using predictive analytics.
- Analyzes sentiment from reviews and social media via NLP.
- Delivers real-time personalization of content and offers.

7.Analysis And Interpretation

Percentage Analysis

General Profile of the Respondents



Demographic factors

Sl.No.	Particulars		No.of Respondents	Percentage
1	Gender	Male	120	60
		Female	80	40
2	Age Group	Below 35years	20	10
		35 – 40 years	120	60
		40 – 45 years	42	21
		Above 45 years	18	9
3	Educational Qualification	School level	74	37
		College level	85	42.5
		Professionals	41	20.5
4	Occupation	Business	58	29
		Employee	94	47
		Professional	20	10
		Farmer	28	14
5	Monthly Income	Below 20,000	56	28
		20,000-30,000	74	37
		30,000-40,000	42	21
		Above 40,000	28	14
6	Marital status	Married	105	52.5
		unmarried	95	47.5

INTERPRETATION:

Understanding the demographic characteristics of respondents is crucial in analyzing how different segments perceive the role of advertising in influencing consumer behaviour toward FMCG products. The survey includes a diverse group across gender, age, education, occupation, income, and marital status. Out of 200 respondents, **60% are male**and**40% are female.** Majority (60%) of respondents are in the **35–40 years** category. **2.5% are college level graduates,** followed by **37% school level,** and **20.5% professionals. 7% are employees, 29% business owners, 14% farmers**, and**10% professionals. 37% earn between ₹20,000–30,000,** followed by **28% below ₹20,000, 21% between ₹30,000–40,000,** and **14% above ₹40,000. 52.5% are married**, while **47.5% are unmarried.**

Chart 1

FACTORS AFFECTING CONSUMER PERCEPTION:

Relationship between consumers' awareness of AI-driven sustainable marketing and their perception of brand sustainability.

S.No	Factors	Points	Mean points
1	Younger consumers may show higher acceptance of AI in sustainable marketing.	224	4.48
2	Gender differences may or may not influence AI-driven sustainability perceptions	226	4.52
3	Higher income groups may perceive more value in AI-based sustainable initiatives.	196	3.92
4	Education level could significantly shape understanding and acceptance of AI-driven marketing.	177	3.54

INTERPRETATION:

The analysis of demographic factors reveals that consumer perceptions towards AI-driven sustainable marketing vary across different groups. Among the factors studied, **gender differences (Mean = 4.52)** emerged as the most influential, indicating that male and female consumers perceive AI-driven sustainability initiatives differently, which suggests the need for gender-sensitive marketing strategies. Similarly, **age (Mean = 4.48)** plays a significant role, as younger consumers show higher acceptance of AI in sustainable marketing due to greater technological adaptability and openness to innovation. **Income levels (Mean = 3.92)** also influence consumer perceptions, with higher income groups perceiving greater value in

AI-based sustainability practices. This reflects that affordability and willingness to pay are important considerations for AI adoption in marketing. On the other hand**, education (Mean = 3.54)** recorded the lowest influence, suggesting that while education contributes to awareness and understanding, it is not the primary determinant of consumer acceptance compared to age, gender, or income.

Findings:
According to research, AI has the ability to collect massive volumes of data in record speed because to iterative processing and algorithms that allow software to learn from patterns. AI's several subfields all function differently. Since people's interests and fashions are constantly changing, AI can be useful, even basic variables like personality traits remain consistent, client personas may change gradually over time as trends change. AI automation may make it much simpler to organize all of this. Marketing teams can stay on top of rapidly evolving fads and trends to provide clients and potential customers with material that is timely, relevant, and tailored to their needs. Marketing campaigns can now feature a substantially higher degree of personalization that the marketers use to do previously, by better adjusting their content and products to the unique consumer preferences, marketers utilizing AI-driven tactics can increase customer engagement and conversion rates.

CONCLUSION

Harnessing the power of AI, businesses can achieve sustainability goals while driving growth and customer loyalty. AI-powered sustainable marketing and consumer analytics enable companies to make data-driven decisions that reduce waste and environmental impact. Personalized eco-friendly messaging and sustainable practices become integral to a company's brand identity. With transparent algorithms and responsible data handling, businesses can build trust with environmentally conscious consumers. AI transforms marketing by bridging innovation and environmental responsibility.

A STUDY ON SOCIAL MEDIA MARKETING AND INFLUENCE ON CONSUMER BEHAVIOUR

Esther Rajathy
B.COM Management Studies
Guru Nanak College of Arts, Science and Commerce (Autonomous)
GTB Nagar, Sion, Mumbai

Abstract
Social media has rapidly evolved from being a platform for personal interaction to becoming one of the most influential marketing tools of the twenty-first century. Businesses of all sizes—ranging from start-ups to global corporations—are increasingly using platforms such as Facebook, Instagram, YouTube, LinkedIn, and TikTok to promote their products and services. Unlike traditional advertising, social media offers interactive communication, instant feedback, and targeted reach, making it cost-effective and highly engaging for consumers.
The purpose of this study is to examine how social media marketing influences consumer behavior, brand visibility, and overall business performance. A key aspect is its ability to shape purchasing decisions through peer reviews, influencer recommendations, and creative brand campaigns. Influencer marketing, in particular, has emerged as a powerful tool where individuals with niche or large followings guide consumer preferences and create trust through relatability and authenticity.
This research concludes that social media marketing is no longer optional but essential for modern businesses. It enhances brand recognition, provides measurable promotional opportunities, and influences consumer decision-making. While challenges such as algorithm changes and oversaturation of advertisements remain, the advantages significantly outweigh the risks, making social media a critical driver of marketing success in the digital era.
Keywords: Social Media Marketing, Consumer Behavior, Influencer Marketing, Brand Trust, Digital Advertising, Online Engagement

INTRODUCTION

Marketing has always been about building connections, creating awareness, and influencing consumer choices. Traditionally, these goals were achieved through television, radio, print, and outdoor advertisements. However, the digital revolution has shifted this landscape significantly. Today, social media platforms such as Instagram, Facebook, TikTok, and YouTube are central to marketing strategies.

Social media allows businesses to move beyond one-way advertising and adopt a two-way communication model. Brands can receive immediate feedback, engage in conversations, and even personalize promotions for individual customers. This interactive nature makes social media different from traditional methods.

Moreover, younger generations now rely more on online communities, reviews, and influencer recommendations than on conventional advertisements. As a result, businesses cannot afford to ignore the digital marketplace. The aim of this paper is to explore how social media marketing influences consumer behavior and brand success, while also identifying its opportunities and challenges.

OBJECTIVES OF THE STUDY

The study has the following objectives:
1. To examine how social media affects consumer purchasing behavior.
2. To analyze the effectiveness of influencer marketing.

3. To understand how online engagement builds trust and credibility for brands.
4. To evaluate the cost efficiency of social media compared to traditional advertising.
5. To explore the limitations and risks associated with social media marketing.

Review Of Literature

Several researchers and practitioners have studied the growing impact of social media on marketing practices. Mangold and Faulds (2009) describe social media as a hybrid element of the promotion mix that combines traditional marketing with online engagement. Kaplan and Haenlein (2010) further explain that social media provides businesses with both opportunities and challenges in managing consumer relationships.

Recent industry reports also highlight the effectiveness of influencer marketing. According to Hootsuite (2024), brands collaborating with micro-influencers often experience higher trust levels and improved engagement compared to those working with celebrities. Statista (2024) reports that nearly 70% of global consumers claim that their purchasing decisions are influenced by social media interactions.

These studies collectively suggest that social media is not just a tool for promotion but a powerful medium that influences consumer psychology and brand loyalty.

Background

The global shift to digital spaces has reshaped business strategies. Social media platforms serve not only as communication tools but also as virtual marketplaces. For instance, Instagram allows shopping directly from posts, while TikTok trends often drive product popularity overnight.

In India, the rise of affordable internet and smartphones has accelerated social media usage. Young consumers spend significant time on platforms, making them the perfect audience for digital marketing campaigns. Globally, businesses are adapting to similar trends, where online engagement determines brand relevance.

The setting of this study combines global observations with local insights, focusing on how businesses in emerging economies can benefit from social media influence while managing its risks.

Research Methodology

This research follows a qualitative approach based on secondary data. Academic journals, case studies, and industry reports were reviewed to identify consumer trends and business strategies. Examples of successful campaigns were studied to understand the effectiveness of influencer-driven promotions.

The study does not focus on numerical data analysis but instead interprets observed patterns, consumer behavior, and marketing practices in real-world contexts. This descriptive method provides practical insights into the evolving digital marketing space.

Social Media Influencing Consumer Behaviour

1. Consumer Buying Behavior

Social media platforms heavily influence purchasing decisions. Many users rely on peer reviews, product unboxing videos, or influencer recommendations before buying. Impulse buying is also triggered by targeted advertisements.

2. Role of Influencers

Influencers are now central to social media marketing. Micro-influencers (with smaller but loyal followers) often create stronger trust compared to celebrities. For example, local content creators who share authentic experiences can drive sales in niche markets.

3. Building Brand Trust
Brands that interact with their audiences by responding to comments, sharing customer stories, and posting consistent content build stronger credibility. Transparent communication is viewed positively by consumers.
4. Cost Efficiency
Social media campaigns are more affordable than television or newspaper ads. Paid promotions allow precise targeting by age, location, and interest, ensuring better return on investment.
5. Challenges
Despite its potential, social media marketing faces challenges such as algorithm changes, fake followers, negative feedback, and oversaturation of promotional content. These issues reduce campaign predictability.
6. Engagement vs. Sales
High engagement (likes, shares, views) does not always convert into purchases. However, engagement strengthens long-term brand-consumer relationships, which is essential for sustained growth.

Challenges

- The study is based only on secondary data and does not include primary surveys or interviews.
- Consumer behavior changes rapidly, so findings may shift over time.
- Cultural differences in social media usage are not explored in depth.
- Sales data and direct financial impacts were outside the scope of this study.

CONCLUSION

Social media has become an essential element of modern marketing. It allows businesses to directly reach consumers, build trust, and create personalized campaigns at relatively low cost. Influencers, online communities, and interactive content now play a major role in shaping consumer behavior.
However, social media marketing is not without risks. Oversaturation, authenticity concerns, and changing algorithms present ongoing challenges. Despite these, the benefits far outweigh the drawbacks, making social media a dominant force in shaping brand influence and consumer decisions in the digital era.

IMPACT OF SOCIAL MEDIA MARKETING ON CONSUMER PURCHASE DECISIONS AND BRAND LOYALTY

Aishwini B, Sanjay P R
Dr. N. G. P Arts & Science College, Coimbatore

Abstract:
Social media marketing has redefined how businesses interact with consumers, offering brands powerful tools to influence purchasing decisions and foster long-term loyalty. This presentation examines the multifaceted impact of social media platforms such as Facebook, Instagram, etc., on modern consumers. Key social media activities, including influencer campaigns, targeted advertisements, and peer reviews, drive brand engagement, trust, and awareness, thus enhancing purchase intent and satisfaction.Research findings reveal that personalized content, authentic user interactions, and accessible product information collectively shorten the consumer buying process, making decision-making easier and more enjoyable. Furthermore, demographic factors such as age and gender shape how different consumer groups respond to social media marketing efforts, emphasizing the need for strategic and adaptive digital campaigns. By analysing recent studies and digital marketing trends, this presentation highlights the transformative potential of social media marketing to build brand loyalty, accelerate purchase decisions, and reshape the competitive landscape for businesses in today's digital-first marketplace.
Keywords:Social media marketing, Consumer interaction, Purchasing decisions, Brand loyalty, Influencer campaigns, Targeted advertisements, Peer reviews, Brand engagement, Brand awareness, Personalized content, Product information

INTRODUCTION:

Social media marketing (SMM) refers to the strategic use of social media platforms to connect with audiences, build brand awareness, drive sales, and increase website traffic. Unlike traditional marketing, SMM enables brands to engage directly with consumers through interactive content and real-time communication. As of 2025, over 5.42 billion people worldwide are active users of social media, making it the most accessible and powerful marketing channel available.

Evolution and Importance of Social media marketing

Social media marketing has evolved from simple brand visibility and awareness to a full-funnel revenue driver. In 2025, it is no longer just about gaining likes or followers; it is about turning global reach into precise, actionable engagement, driving full-funnel growth from awareness to conversion. Brands use advanced targeting, A/B testing, influencer collaborations, and shoppable content to nurture purchase intent.The shift in social media habits requires marketers to adopt data-driven strategies that focus on authentic engagement and timely interactions. For example, 80% of consumers expect brands to respond on social media within 24 hours, reflecting the high standard for real-time customer care that SMM supports.

Major Platforms in Marketing

The primary social media platforms driving marketing strategies today include Facebook, Instagram, etc., Each offers unique features:

- Facebook
- Instagram

Together, these platforms provide brands multiple avenues to reach diverse consumer segments.

Objectives:

- Social media marketing significantly influences consumer purchase decisions by leveraging key activities such as influencer campaigns, targeted advertisements, and peer reviews to build brand engagement, trust, and awareness.
- Personalized content and authentic user interactions on platforms like Facebook, Instagram, and TikTok shorten the consumer buying process, making decision-making easier and more enjoyable.
- Demographic factors such as age and gender shape how different consumer groups respond to social media marketing efforts, highlighting the need for strategic and adaptive digital campaigns.
- The presentation aims to provide actionable insights for businesses to design more effective, adaptive social media strategies that build sustained brand loyalty and competitive advantage in a digital-first marketplace.

Review Of Literature

Social media marketing (SMM) has rapidly transformed consumer-brand interactions, enabling brands to influence purchasing behavior and build loyalty via platforms like Facebook, Instagram, and TikTok. Existing studies highlight key activities such as influencer marketing, targeted ads, and user-generated content as crucial drivers of brand engagement and trust. Research indicates that personalized content and authentic interactions significantly shorten the consumer buying process, while demographic factors influence responsiveness to social media campaigns. The literature stresses the increasing role of social commerce and AI-driven personalization in shaping consumer decisions in digital marketplaces.

Influencer Campaigns:

Influencer marketing continues to be a dominant strategy in 2025. By partnering with trusted personalities who have dedicated followers, brands can amplify their reach and credibility. Influencers create authentic, relatable content that resonates with their audience, fostering trust and driving purchase intent. For example, collaborations with TikTok creators or Instagram influencers often result in viral content that significantly boosts brand visibility and consumer interest.

Targeted Advertisements:

Social media platforms offer sophisticated targeting tools that allow marketers to tailor ads based on age, location, interests, and behaviors. These targeted ads enhance the relevance of marketing messages, increasing the likelihood of conversion. Personalized advertisements based on past interactions or shopping behavior make consumers more receptive, thereby accelerating their purchase decisions.

Peer Reviews And User-Generated Content (Ugc):

Consumers highly value peer opinions and authentic experiences shared on social media. User-generated content such as reviews, testimonials, unboxing videos, and story shares act as social proof that strengthens brand trust. Encouraging customers to share their stories creates a community feel and enhances loyalty through shared brand advocacy.

Impact On Consumer Purchase Decisions:

Social media marketing has deeply transformed consumer purchase behavior by providing richer, more accessible information and fostering emotional connections with brands. Studies show that over 80% of consumers admit social media impacts their buying decisions, underscoring its central role in guiding purchase intent.

Social Media Influences The Consumer Buying Process
Traditionally, the consumer buying process includes stages like need recognition, information search, evaluation of alternatives, and purchase. Social media shortens and simplifies this process by offering instant access to product information, peer reviews, influencer recommendations, and interactive content, which collectively reduce the research and evaluation stages.

Personalized Content And Authentic Interactions
Consumers respond more positively to personalized advertisements and authentic user interactions enabled by social media platforms like Facebook, Instagram, and TikTok. Targeted ads based on users' interests and online behavior make marketing messages more relevant, increasing the likelihood of conversion. Moreover, authentic content such as influencer videos, live streams, and tutorials build credibility and trust, further accelerating purchase decisions.

Role Of Peer Reviews And User-Generated Content
Peer-generated content, including reviews and product tutorials, significantly shapes consumer trust. Research highlights that influencer reviews and product tutorials influence buying decisions more than traditional advertisements, although consumer trust varies and increasingly favors authentic peer opinions over sponsored posts.

Demographic Variations
Younger consumers, particularly Gen Z and millennials, exhibit higher sensitivity to influencer content and peer reviews. Older demographics may prioritize detailed product information and brand reputation differently. This highlights the importance of segment-specific social media strategies to maximize impact.

Research Insights And Business Implications
Businesses can optimize purchase conversion by leveraging data-driven personalization, interactive content, and peer engagement. A transparent and consistent social media presence nurtures trust, shortens decision-making time, and enhances overall consumer experience in the digital marketplace.

Methodology
The analysis is based on synthesizing insights from recent empirical research, market reports, and social media usage statistics relevant to 2025. Data was gathered from global surveys of consumer behavior, marketing ROI studies, platform-specific engagement metrics, and advertising spend reports. This comprehensive approach allows examination of how social media marketing strategies drive purchase decisions and loyalty across diverse demographics, incorporating quantitative ad performance data and qualitative user engagement trends.

Findings
- Social media marketing significantly boosts brand discovery, engagement, and purchase intent by leveraging influencer campaigns, targeted advertisements, and peer reviews.
- Personalized and authentic content on social platforms streamlines and accelerates consumer purchase decisions.
- Demographic differences, particularly age and gender, shape consumer responsiveness, underscoring the need for tailored and adaptive marketing strategies.

- Social commerce is increasingly driving direct purchases within platforms, shifting traditional e-commerce paradigms.
- Influencer marketing ROI surpasses traditional ads, especially through micro-influencers with engaged niche audiences.

Learnings

Successful social media marketing demands a strategic balance of authentic engagement, data-driven ad targeting, and demographic customization. Brands that adapt their content and campaigns to evolving social media behaviors and integrate commerce features are well positioned to build enduring loyalty and competitive advantage. Emerging trends such as AI personalization, short-form video, and social search optimization will further shape effective digital marketing strategies. Continuous measurement and agile campaign optimization are key to sustaining impact in a dynamic digital-first marketplace.

CONCLUSION

Dominance of Short-Form Video: Platforms like TikTok, Instagram Reels, and YouTube Shorts will continue to drive engagement through creative, digestible content. AI and Personalization: Generative AI enables hyper-personalized, scalable content that resonates deeply with segmented audiences, overcoming ad fatigue and privacy concerns. Social Commerce and Direct Sales: Seamless in-app purchases and shoppable posts shorten the path from discovery to conversion, accelerating sales cycles. Niche Communities and Authentic Engagement: Brands will increasingly cultivate micro-communities and leverage subscription-based exclusive content to deepen loyalty and advocacy. Social Search Optimization: Social media is evolving into a search and discovery engine, requiring brands to optimize content for social search and AI-driven recommendation algorithms. Social media marketing in 2025 represents a dynamic, multi-dimensional approach that blends creativity, technology, and human connection. Brands that build flexible, insight-led strategies and embrace emerging trends will secure competitive advantage, drive sustained growth, and forge lasting loyalty in an increasingly connected world.

FOOD WASTE: CAUSES, STUDENT-LED SOLUTIONS, AND COMMUNITY INITIATIVES FOR MINIMIZING WASTE

Dr. K. Deepa
Assistant Professor of Commerce,
Kumaraguru college of liberal arts and science, Coimbatore,TamilNadu
R. Sreenivasa Sai Kumar Reddy, Swaroop. S
III B.Com (PA), Kumaraguru college of liberal arts and science, Coimbatore,TamilNadu

Abstract
Food waste has become a significant global issue; causing environmental harm, economic impact, and food insecurity.Excess purchasing, poor meal planning, awareness issues, and confusion about 'best before' or 'use by' dates are all causes of food waste - likely experienced by many students. Understanding these causes is essential to developing suitable recognitions of food waste and culturally appropriate interventions that address sustainable consumption behaviours. This study examined the causes of food waste among school, undergraduate, and postgraduate students, and explored the perceived impact of student-led, and community initiatives to reduce waste. Data were collected using a google forms questionnaire to explore food purchasing behaviour, food storage practices, and food waste reduction program involvement. Although many students were aware of the environmental, and social effects of food waste, awareness did not always lead to behaviour change. The student-led actions (awareness campaigns, food sharing, composting etc.) involving community partnerships, showed potential for substantial waste reduction. Also, improving student engagement through one by working with local communities and sustainability education. In summary, the study reinforces the need for food waste education to be integrated into academic curriculum, and the need for programs to be sustained, providing an environment supportive of responsible food management. The findings will provide evidence to educational institutions and policy makers on supporting and empowering students to be agents of change in global food waste efforts.
Key words:Food Insecurity, Composting, Waste Reduction, Consumption Behaviour,Meal Planning

INTRODUCTION

Food waste is a serious global challenge that has dire environmental, economic and social consequences. There are many reasons why students waste food, namely over-purchasing, lack of planning, lack of knowledge, lack of awareness, and relative difficulty understanding 'best before' or 'use by' dates. Waste also reinforces food insecurity, and leads to continued resource depletion. Understanding the reasons why school, undergraduate, and postgraduate
students waste food is paramount in identifying effective and culturally appropriate ways to encourage sustainable consumption. The current study looks at student food purchasing and storage behaviours, and provides insight into student-led and community initiatives to reduce waste. Greater engagement of students and collaboration with local communities will provide additional rewards for sustainable food management practices. The findings might assist educational institutions and policymakers, who wish to be part of integrating education around food waste into their curricula and sustaining interest in empowering students to be active individuals reducing global food waste.
Problem Statement

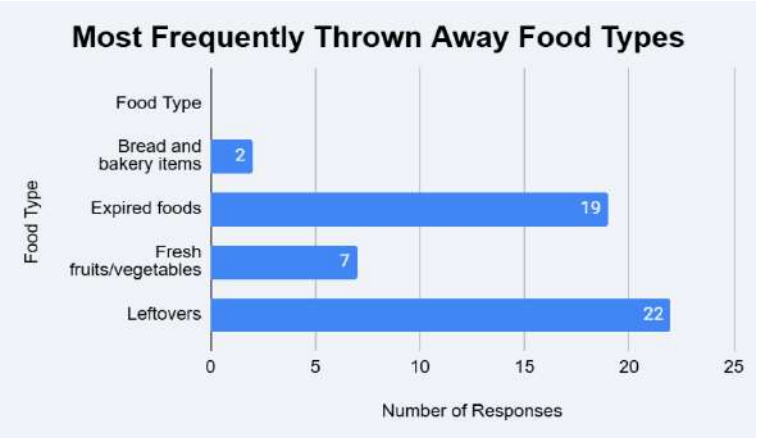
Food wastage caused by students on campuses is a major source of environmental damage and waste of resources. Student behavior related to food waste often includes over-buying, lack of meal-planning, and confusion around expiry dates. Many of these are factors that continue to occur despite education and awareness campaigns. It is unclear how effective are student and community-led interventions in reducing food food waste, making it necessary to focus on conduits to the root causes of food waste and program impacts.

Objectives

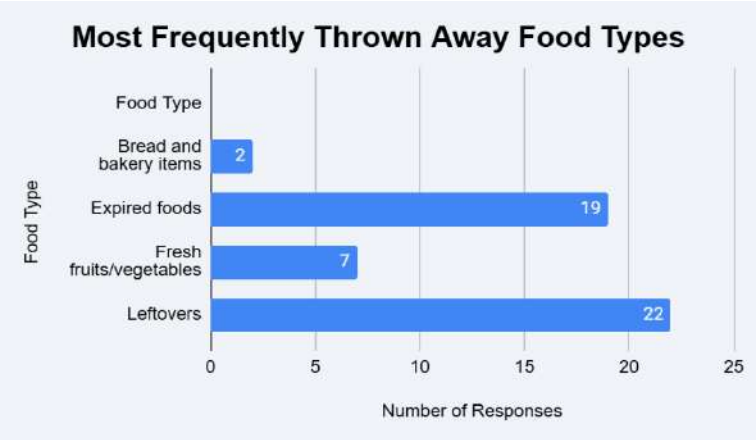
1. To identify the main causes of food waste in households, schools, and local communities.
2. To explore and document student-led initiatives aimed at reducing food waste on campus or neighborhood levels.

Review of literature

1. Clement (2023) cited poor meal planning, overpurchase, misunderstanding of food's expiration dates, and low engagement in food preparation as key contributors to waste among youth consumers. The study highlighted the attitude-behavior gap, where, despite positive environment-related attitudes, individuals did not change their behaviors since they lacked the knowledge and motivation to do so.
2. Petrescu-Mag et al. (2024) underscored the importance of grasping the direct and indirect causes of food waste in order to devise measures to reduce it. Community-based causal analysis identified the value of changes in upstream food waste drivers by investing in activity-specific equipment for food storage and transportation in addition to investing in upward-infrastructure improvements; ultimately, a reduced- or rerouted-waste focus on the problem of food waste was ineffectual relative to addressing root causes of food waste.



Research methodology

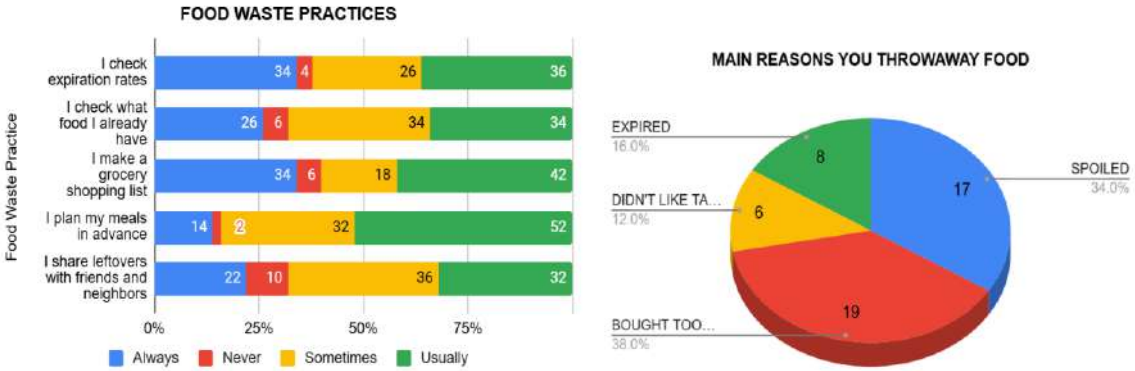


The study employed a descriptive research design with a quantitative approach to examine causes of food waste and participation in reduction initiatives among secondary, undergraduate, and postgraduate students. Primary data were collected through a structured, piloted questionnaire administered via Google Forms. The instrument included demographic items, questions on food purchasing and storage practices, and a multiple-choice grid on habitual behaviours. Participants were recruited through convenience sampling across three age groups (15–18, 19–22, and 22+ years) from educational institutions, with the survey link circulated via digital platforms. Responses were collected anonymously with informed consent, and data quality was ensured through validation checks. Descriptive statistics, including frequency distributions, percentages, and cross-tabulations, were applied to analyse patterns and relationships between demographic factors and food waste behaviours.

Findings

Table No.1
Demographic profile of respondents

FACTORS	NO.OF RESPONDENTS	PERCENTAGE
AGE(YEARS)		
15-18	10	20
19-22	27	54
ABOVE22	13	26
TOTAL	50	100
GENDER		
MALE	26	52
FEMALE	22	44
PREFER NOT	2	4
TOTAL	50	100
STUDENT		
HIGHER SECONDARY	7	14
UNDERGRADUATE	29	58
POSTGRADUATE	14	28
TOTAL	50	100
LIVING WITH		
ALONE	3	6
FAMILY	41	82
ROOMMATES	6	12
TOTAL	50	100



Interpretation

Food waste is largely driven by the following responses; 'Leftovers' (36%) and 'Expired foods' (32%). 52% of respondents indicated that the food they wasted was edible and wasted it 'Sometimes' or 'Often'. The reason these respondents wasted food was mainly because the food had 'Expired' (40%) or they 'Bought too much' (28%).

While many respondents 'Always' or 'Usually' check to see if food is expired (76%) and make a grocery list (72%), they were not as consistent with meal planning; only 40% 'Always' or 'Usually' consider meals ahead of time. 44% responded that they 'Never' shared their leftovers. This implies respondents are aware about wasting food but the practical strategies to address this waste (like having meal plans and sharing leftovers) could improve to effectively address food waste.

Suggestions

1. Conduct workshops on meal planning to help students practice portion sizes and minimizing excess purchasing.
2. Promote consistent use of shopping lists to reduce impulse buying and to minimize excess food.
3. Establish food sharing stations in campus locations to make it easy for students to redistribute their extra food.
4. Facilitate training on food storage and preservation practices to help them minimize spoilage.
5. Conduct interactive sessions with real food experts to clarify the difference between "use by" and "best before" dates.

CONCLUSION

The environmental and social consequences of food waste by students and communities is significant. This study finds that increasing engagement with students and the wider community while providing education, awareness, and practical actions, such as sharing food or composting food, can reduce food waste. Facilitating responsible behaviors and effective collaboration on products and actions allows students to be empowered as catalysts for developing long-term sustainable food management practices.

EMERGING TRENDS AND INNOVATIVE STRATEGIES IN DIGITAL MARKETING

Sam Godson M, Harishma M
MBA, RVS College of Arts and Science,Sulur

Abstract
The digital era has fundamentally transformed marketing, shifting it from traditional broadcast models to technology-driven, consumer-centered strategies. Digital marketing today integrates multiple disciplines, including business analytics, computer science, psychology, and communication studies. This paper explores the most recent trends in digital marketing such as artificial intelligence (AI), personalization, influencer marketing, voice search optimization, and immersive technologies like augmented reality (AR) and the metaverse. It also examines innovative strategies such as storytelling, neuromarketing, sustainability branding, and social commerce. Using case studies from leading global brands, this paper illustrates how digital marketing fosters customer engagement and brand loyalty. Findings suggest that the future of marketing depends on personalized, ethical, and technologically innovative practices that balance business objectives with consumer trust.

1. INTRODUCTION

Marketing has undergone a paradigm shift in the last two decades. Traditional tools such as television and print advertisements are being replaced or supplemented by digital channels powered by the internet, mobile devices, and social platforms. Digital marketing distinguishes itself from traditional marketing not only by scale but also by its capacity for personalization, measurability, and interactivity.

This multidisciplinary field combines business management, which frames strategy; computer science, which powers algorithms and analytics; psychology, which explains consumer behavior; and communication studies, which design content and messaging.

The aim of this paper is threefold:

1. To identify and analyze recent trends shaping digital marketing.
2. To explore innovative strategies adopted by organizations to enhance competitiveness.
3. To examine challenges and future prospects in digital marketing.

2. Recent Trends in Digital Marketing

2.1 Artificial Intelligence and Automation

AI has transformed marketing by enabling predictive analytics, programmatic advertising, and customer service automation. Chatbots provide 24/7 support, while recommendation engines, such as those used by Amazon, personalize shopping experiences.

2.2 Personalization

Today's consumers demand customized content. Platforms like Netflix use algorithms to provide individualized recommendations, which not only increase engagement but also drive retention. Personalization is now a core competitive advantage.

2.3 Video and Interactive Content

Short-form videos dominate digital spaces, with TikTok, Instagram Reels, and YouTube Shorts reshaping how brands communicate. Interactive elements like polls, quizzes, and gamified ads enhance consumer participation.

2.4 Voice Search and Smart Devices

The proliferation of devices like Alexa and Google Home has popularized voice search, compelling marketers to optimize SEO strategies for natural, conversational queries.

2.5 Influencer and Micro-Influencer Marketing
Consumers trust influencers more than traditional ads. Micro-influencers, with smaller but highly engaged audiences, are particularly effective for niche marketing.

2.6 Omnichannel Marketing
A seamless brand experience across online and offline platforms is now essential. Starbucks integrates loyalty programs, apps, and in-store purchases to create consistent customer journeys.

2.7 Data Privacy and Ethical Marketing
Stricter regulations like GDPR have placed emphasis on data transparency. Companies must strike a balance between personalization and consumer trust, making ethical marketing a growing priority.

2.8 Metaverse and AR/VR Marketing
Immersive technologies represent a new frontier. Nike, for example, uses AR features to let customers virtually try on shoes, while brands experiment with metaverse platforms to create digital brand experiences.

3. Innovative Strategies in Digital Marketing

3.1 Content-Driven Storytelling
Brands increasingly focus on creating narratives that emotionally resonate with audiences. Storytelling builds authenticity and deepens consumer-brand relationships.

3.2 Data-Driven Decision Making
The rise of big data allows marketers to analyze consumer behavior in real time, optimize campaigns, and measure ROI with precision.

3.3 Neuromarketing Techniques
By merging psychology and neuroscience, neuromarketing assesses emotional and cognitive responses to marketing stimuli, allowing more impactful campaign design.

3.4 Social Commerce
Social platforms are becoming marketplaces themselves. Instagram and Facebook enable purchases within apps, reducing friction between marketing and sales.

3.5 Sustainability-Focused Branding
As consumers become environmentally conscious, brands integrate sustainability into their identity. Campaigns focused on eco-friendly practices build long-term trust.

3.6 Gamification and Engagement Programs
Gamified loyalty programs and interactive apps increase consumer retention. Starbucks' Rewards Program is a prime example of using gamification to sustain engagement.

4. Case Studies

- Amazon & Netflix: Both leverage AI and machine learning to personalize experiences, demonstrating how data-driven marketing can create loyalty and increase sales.
- Nike: Uses AR and VR in digital campaigns to enhance user experience and promote interactive engagement.
- Coca-Cola: Engages audiences through storytelling campaigns that highlight sustainability and social responsibility.
- Small Businesses: Many startups and SMEs use Instagram Reels and TikTok videos to achieve organic growth without heavy advertising budgets.

5. Challenges and Future Scope

Digital marketing faces pressing challenges, including data privacy concerns, rising cybersecurity risks, and consumer fatigue from excessive ads. Ethical dilemmas around AI-driven targeting also persist.

Looking ahead, Web 3.0 and blockchain technologies are expected to enhance transparency and decentralization. Quantum computing may revolutionize marketing analytics by processing consumer data at unprecedented speeds. The metaverse offers immersive engagement opportunities, but its adoption depends on consumer readiness and affordability.

The future will demand a balance: advanced technology must be paired with ethical responsibility and consumer-centric approaches.

6. CONCLUSION

Digital marketing is evolving into a multidisciplinary innovation where business strategy meets technology, psychology, and communication. Emerging trends such as AI, personalization, influencer marketing, and immersive technologies are redefining consumer engagement. Innovative strategies such as storytelling, neuromarketing, and sustainability-focused branding offer long-term value.

The key to future success lies not just in adopting advanced tools but in maintaining ethical, transparent, and consumer-oriented practices. As digital ecosystems mature, brands that align innovation with trust will lead the way.

ARTIFICIAL INTELLIGENCE IN BUSINESS INNOVATION

Dr.R.Geetha
Department of Commerce, Corporate Secretaryship with CA,
Dr. N.G.P Arts and Science College, Coimbatore
Ms. M.Gokila, Ms.N.Sivadharshini
Department of Commerce Corporate Secretaryship with CA,
Dr. N.G.P Arts and Science College, Coimbatore.

Abstract
While artificial intelligence (AI) requires business model innovation, it simultaneously poses persistent operational, regulatory and strategic challenges, highlighting the importance of researching AI adaptation to appropriate organizational value. AI adaptation is not monolithic, and its nature and consequent value appropriation processes may vary due to external factors and an organization's strategic approach to innovation and resource management. Accordingly, a taxonomy of AI adaptation and its link with value appropriation can yield a theoretical understanding and practical implications of why and how organizations vary in leveraging strategic human resource management to shape business innovation led by AI adaptation. In this paper, we address this issue by applying adaptive structuration theory and conducting interviews with top management personnel from 51 companies based in India. Based on our findings, we develop a novel taxonomy of AI adaptation (exploitive, exploratory, emancipatory and expedient), structured within a 2 × 2 matrix and a robust model of value appropriation within a dynamic business environment.
Keywords: artificial intelligence; business innovation; ethical governance; organizational learning; strategic decision-making; digital transformation

INTRODUCTION

Artificial intelligence (AI), heralded as a source of value, is increasingly becoming an integral part of business management (Huang and Rust, 2021). Its use transcends sectorial and national borders and has ushered in the rapid development of Industry 4.0 (Rampersad, 2020) and, more recently, Industry 5.0 (Noble et al., 2022). AI is not only a change agent within the organizational structure (e.g. Einola and Khoreva, 2023); it can also pivot transformative and innovative management (Von Krogh, Roberson and Gruber, 2023). Given the growing integration of AI into organizational practices and processes, it is imperative to develop a better comprehension of organizational strategies for using and adapting AI (Bankins et al., 2024).

Due to AI's contribution to innovative business modelling and generating value for various stakeholders – including employees and human resource (HR) managers – its effective design and use have become strategic priorities for organizations (Chowdhury, Budhwar and Wood, 2024; Davenport, 2018). However, the proliferation of the use of AI is accompanied by a persistent debate concerning the structural and processual bottlenecks that impede its appropriate use (Huang and Rust, 2021). A survey of UK-based financial services suggests that the deployment of AI can be hindered by many obstacles, such as difficulties in keeping pace with data growth, challenges with customization and a lack of skilled staff.1 Due to AI's pervasive influence on businesses and their employees, governments and regulatory bodies have developed policy frameworks aimed at forcing organizations to adapt AI creatively and context-specifically (Ameen et al., 2024).

Technology adaptation has gained significant research attention, highlighting the essence of the socially and contextually appropriate use of technology (Dey, Newman and Prendergast, 2011; Kung et al., 2015). Drawing from the information systems (IS) literature (Bala and Venkatesh, 2016; Muhammad et al., 2021), AI adaptation can be defined as employees' cognitive and behavioural efforts to manage any perceived consequences associated with AI. Although the adaptation of technology in general – and AI in particular – is centred on individual employee behaviour, it is facilitated by organizational strategies and practices (Chowdhury et al., 2022, 2024). In particular, an organization's strategic human resource management (SHRM) influences AI adaptation through the recruitment of new staff members and the retention, training and development of existing ones (Ameen et al., 2024; Chowdhury, Budhwar and Wood, 2024).

AI Applications and Impacts Across Business Functions

Product and Service Innovation

AI is revolutionizing product and service innovation across industries, enabling companies to develop novel offerings and optimize complex operations. AI is transforming the generation of ideas, business case development, and product design processes in new product development (NPD). Leading companies are leveraging AI to drive innovation; for example, General Motors uses AI for conceptual automobile designs, while Unilever employs AI to develop novel cleaning product ingredients. The adoption of AI in NPD is rapidly increasing, with its usage rising from 13% to 24% between 2023 and 2024, indicating a shift from early adopters to early majority in the innovation diffusion curve.

In the technology sector, AI-powered virtual assistants such as Amazon's Alexa and Apple's Siri have created new product categories and ecosystems. Furthermore, AI's impact extends to service operations, as demonstrated by an innovative decision support system for optimizing integrated home health and social care scheduling. This system showcases AI's advanced capabilities in automated planning, significantly enhancing the efficiency and quality of care delivery compared with traditional manual approaches.

These developments highlight AI's potential to transform both product innovation and complex service operations across various industries, driving efficiency, quality, and novel solutions.

In healthcare, AI is driving innovation in diagnostics, drug discovery, and personalized medicine; for example, AI algorithms can analyze medical images to detect diseases with accuracy comparable to or exceeding that of human experts. AI is also accelerating the drug discovery process through its use in predicting molecular properties and identifying promising compounds.

The financial services industry is also leveraging AI to create innovative products and services. AI-powered robo-advisors are disrupting traditional wealth management by providing automated, low-cost investment advice. Banks are using AI for fraud detection, credit scoring, and personalized financial recommendations.

Operational Efficiency and Process Innovation

AI is revolutionizing business operations through the automation of tasks, process optimization, and enabling predictive maintenance. In the manufacturing sector, AI-powered robots and computer vision systems are enhancing the efficiency of production and quality control. Predictive maintenance algorithms can analyze sensor data to anticipate equipment failures, thus reducing downtime and maintenance costs.

Supply chain management is another area where AI is driving significant innovation. AI algorithms can optimize inventory levels, predict demand fluctuations, and improve

logistics routing; for example, Amazon uses AI to predict customer demand and position its inventory accordingly, enabling faster delivery times.

In the service sector, AI chatbots and virtual agents are transforming customer support operations. These AI-powered systems can handle a large volume of customer inquiries simultaneously, providing round-the-clock support and freeing human agents to focus on more complex issues.

Decision-Making and Strategic Planning

The use of AI can enhance decision-making processes through the analysis of vast amounts of data to provide actionable insights. In marketing, AI algorithms can analyze customer data to segment audiences, personalize messaging, and optimize the targeting of advertisements . This enables more effective and efficient marketing campaigns.

AI-powered systems in finance are revolutionizing algorithmic trading, risk assessment, and portfolio management through the processing of market data in real-time and executing trades faster than human traders. A study has enhanced these systems through integrating MultiAgent Reinforcement Learning (MARL) and XAI to optimize trading strategies. The proposed NeuroAlpha Vintage Explorer demonstrated improved accuracy and transparency, offering a novel framework for AI-driven strategic planning that balances algorithmic power with comprehensible decision-making.

At the strategic level, AI is being applied in the context of scenario planning and competitive intelligence. Machine learning algorithms can analyze industry trends, competitor actions, and market signals to inform strategic decision-making. For example, IBM's Watson for Strategic Planning uses natural language processing and machine learning to analyze vast amounts of structured and unstructured data, helping executives to identify emerging opportunities and threats.

Customer Experience and Personalization

AI is enabling businesses to deliver highly personalized customer experiences at scale. Recommendation systems powered by machine learning algorithms analyze user behaviors and preferences to suggest relevant products or content. Major tech companies such as Amazon, Spotify, TikTok, YouTube, and Alibaba have developed sophisticated AI-driven engines that process vast amounts of user data to deliver highly personalized content and product suggestions. These systems employ advanced techniques such as deep learning, natural language processing, and graph-based analysis to understand user preferences and behavioral patterns; for instance, Amazon Personalize generates tailored product recommendations, Spotify's "Discover Weekly" curates personalized playlists, and TikTok's "For You" algorithm adapts content recommendations in real-time, maximizing user engagement. These AI-powered recommendation systems excel in rapidly adapting to changing user preferences, significantly enhancing customer satisfaction and driving business growth.

In retail, AI is enabling personalized shopping experiences both online and in physical stores. Computer vision and facial recognition technologies allow retailers to identify customers and provide tailored recommendations or offers, while virtual and augmented reality applications powered by AI enable virtual try-ons and immersive product demonstrations.

Critical Evaluation of AI Impact Studies

This section examines the discrepancies in AI studies on business innovation and discusses related challenges, needs, and risks. As AI transforms business, researchers have found varied approaches and outcomes across sectors. These differences highlight the

complexity of AI adoption in business contexts and the need for a nuanced understanding of its impacts.

Service Innovation

- AI is driving service innovation in various ways, detailed as follows:
- Personalization: AI enables the creation of highly personalized experiences and services based on customer data analysis.
- New business models: AI facilitates the development of entirely new services, such as advanced virtual assistants and predictive analytics platforms.
- Enhancement of existing products: AI is used to continuously update and optimize services, making them more intelligent and adaptable.
- Simulation and validation: AI-based Business Game Simulators (BGSs) allow for the testing of new services in virtual environments before launch.
- However, the adoption of AI for service innovation poses certain challenges, such as the need for significant organizational and cultural changes.

Operational Efficiency

- AI is improving business operational efficiency in the following ways:
- Automation: AI enables the automation of repetitive tasks and complex processes, freeing human resources for higher-value activities.
- Supply chain optimization: AI algorithms can predict demand, optimize inventory, and improve logistics.
- Predictive maintenance: AI can anticipate equipment and machinery failures, enabling proactive maintenance.
- Process simulation: AI-based BGSs facilitate the optimization of operational processes in virtual environments.
- Nevertheless, the implementation of AI systems may require significant initial investments and staff training.

Decision-Making

- AI is also revolutionizing business decision-making processes:
- Predictive analytics: AI models can analyze large volumes of data to predict trends and support strategic planning.
- Real-time decisions: AI processes real-time information and provides immediate recommendations.
- Bias reduction: When properly implemented, AI algorithms can help to reduce human biases in decision-making.
- Scenario simulation: BGSs allow for the evaluation of different decision scenarios before implementation.
- However, there is a risk of over-reliance on AI systems and concerns about the transparency of some algorithms.

Customer Experience

- AI is significantly enhancing the customer experience, as follows:
- Round-the-clock customer service: Chatbots and virtual assistants can provide continuous attention to customers.
- Personalized recommendations: AI analyzes customer behaviors to offer highly personalized recommendations.
- More natural interactions: Natural language processing technologies enable more fluid interactions with automated systems.

- Experience simulation: AI-based BGSs allow for the optimization of customer experiences in virtual environments.
- Nonetheless, concerns regarding privacy and the ethical use of customer data have arisen.

Case Studies of AI-Driven Business Innovation

The application of AI in business innovation extends beyond theoretical frameworks, as evidenced by real-world implementations across various industries. This section examines two prominent case studies that illustrate the transformative potential of AI in driving innovation and creating value.

Nike's AI-Powered Virtual Platform for Product Development

Nike has leveraged AI to revolutionize its product development process through Nikeland, a virtual platform on Roblox. This innovative approach demonstrates the practical application of AI in business innovation:

Implementation

- Created a digital space where users can customize avatars with exclusive Nike items.
- Integrated AI algorithms to analyze user interactions and preferences.
- Utilized the platform as a virtual testing ground for new product concepts.
- Implemented rapid prototyping capabilities enabled by AI-driven insights.

CONCLUSION

In conclusion, AI is profoundly transforming the way in which businesses operate and innovate. AI offers significant opportunities to improve efficiency, decision-making processes, and customer experiences; however, it also poses significant challenges in terms of its implementation, ethics, and organizational change. Businesses must adopt a balanced approach, leveraging the potential of AI while carefully addressing its broader implications. The synergy between the four analyzed areas is evident, as improvements in one often lead to benefits in others.

It is important to recognize that the application of AI can vary significantly, depending on the industry and size of the company. While some applications—such as chatbots—may be relatively easy to implement, others—such as AI-based decision-making systems for senior management—may require more complex and careful implementation. Ultimately, the successful adoption of AI will depend on the ability of the business to integrate these technologies ethically and responsibly, maintaining a balance between technological innovation and human needs.

BLOCKCHAIN IN AUDITING

Dr. S. Kowsalya
Associate Professor and Head, Department of Commerce CS CA
Mr. N. Nitheesh
I M. Com CS, Department of Commerce CS CA,
Dr. N.G.P. Arts and Science College, Coimbatore.

Abstract
Blockchain technology is revolutionizing auditing by offering immutable, transparent, and consensus-driven records that enhance the integrity of financial data. This article explores how blockchain reshapes auditing practices by enabling real-time verification, continuous auditing, and fraud detection. It examines key applications such as triple-entry accounting and smart contracts, alongside the convergence of blockchain with artificial intelligence (AI). The discussion highlights both opportunities and challenges, including scalability, privacy, liability, and the evolving skill set required by auditors. The article concludes by emphasizing the need for educational reform and standardization to prepare audit professionals for a blockchain-enabled future.
Keywords: Blockchain, Auditing, Continuous Auditing, Triple-entry Accounting, Artificial Intelligence, Assurance

1. INTRODUCTION

Auditing has long been central to financial reporting, ensuring accountability, transparency, and compliance with laws and regulations. Traditional audit processes involve extensive manual verification, sampling techniques, and reconciliations across ledgers and financial statements.

While these practices have supported financial integrity for decades, they remain vulnerable to inefficiencies, fraud, and delays. The rapid growth of digital technologies, particularly blockchain, presents a paradigm shift in how auditors approach their work.

Blockchain, as a distributed ledger technology, offers immutable, secure, and consensus-driven transaction records. These qualities directly address common challenges in auditing, such as fraudulent manipulation of financial information, the opacity of financial reporting, and time-intensive reconciliations.

This article explores blockchain's applications, benefits, challenges, and implications for the auditing profession, situating its role within the broader digital transformation of financial services.

2. Blockchain Fundamentals For Auditors

Blockchain can be defined as a distributed ledger that records transactions across multiple nodes in a secure and verifiable manner. Its fundamental characteristics include:

1. Immutability: Once validated, records cannot be altered without consensus.
2. Transparency: Transactions are visible to authorized participants, ensuring accountability.
3. Decentralization: No single entity controls the ledger, reducing dependence on intermediaries.
4. Consensus mechanisms: Validation requires agreement among multiple nodes, ensuring accuracy and trust.

For auditors, these features ensure reliable, tamper-proof audit evidence. Unlike traditional databases, which are vulnerable to manipulation by insiders, blockchain's consensus-driven **model** distributes trust across the network. This creates an unprecedented level of assurance for financial transactions**.**

2.1 Triple-entry Accounting

Blockchain enables triple-entry accounting, an extension of the traditional double-entry system. In this model, each transaction is recorded not only by the two parties involved but also by the blockchain itself as an immutable third entry. This shared ledger reduces disputes, improves reconciliation, and creates a permanent audit trail (Dai &Vasarhelyi, 2017).

2.2 Continuous Auditing

Blockchain allows for continuous auditing, where auditors can monitor transactions in real time rather than relying solely on retrospective reviews. This reduces the risk of undetected fraud and ensures timely assurance for stakeholders.

3. Applications Of Blockchain In Auditing

Blockchain has numerous applications in auditing and assurance, including:

3.1 Continuous Assurance

By providing real-time access to verified data, blockchain supports ongoing monitoring and reduces reliance on sampling techniques. Auditors can focus more on judgment-based tasks rather than repetitive verifications.

3.2 Smart Contracts

Smart contracts are self-executing agreements embedded in blockchain code. They can automate compliance checks, enforce contractual obligations, and provide immediate assurance. For auditors, smart contracts reduce manual oversight while improving efficiency (Cong & He, 2019).

3.3 Cryptocurrency and Digital Asset Auditing

As digital currencies and blockchain-based assets proliferate, auditors must verify transactions on blockchain networks. Tools such as PwC's Halo and EY's Blockchain Analyzer have been developed to support cryptocurrency audits, reflecting the growing importance of blockchain expertise in auditing.

3.4 Integration with Enterprise Systems

Audit firms are experimenting with integrating blockchain solutions into enterprise systems for supply chain auditing, contract verification, and compliance monitoring. Deloitte and KPMG have invested heavily in developing blockchain platforms that enhance audit services.

4. Blockchain And Ai In Auditing

Blockchain provides verified, tamper-resistant data, while AI enhances analytical capacity. Their integration creates powerful opportunities for auditing:

- Anomaly detection: AI algorithms analyze blockchain data to identify irregular patterns that may indicate fraud.
- Automated assurance: Continuous auditing becomes feasible when AI reviews blockchain records at scale.
- Risk evaluation: Machine learning models assess compliance risks in real time, providing auditors with actionable insights.

Blockchain enriches AI-enabled auditing by ensuring the trustworthiness of data. This integration reduces reliance on subjective auditor judgment and strengthens confidence in assurance outcomes.

5. Benefits And Opportunities

The adoption of blockchain in auditing brings significant advantages:

1. Efficiency and automation: Reduces manual reconciliations, saving time and costs.

2. Transparency and traceability: Provides a clear audit trail for every transaction.
3. Fraud prevention: Immutable records make financial manipulation nearly impossible.
4. Regulatory compliance: Smart contracts enforce compliance automatically, easing the burden on auditors.
5. Enhanced trust: Stakeholders gain confidence from the integrity and reliability of blockchain-based records.

These benefits suggest blockchain may become as transformative to auditing as double-entry bookkeeping was in the past.

6. Risks and challenges

Despite its promise, blockchain adoption in auditing raises several concerns:

6. Scalability: Public blockchains often struggle with speed and cost efficiency.
7. Legal liability: Questions remain about responsibility when smart contracts fail or execute incorrectly.
8. Privacy conflicts: Transparency may conflict with confidentiality requirements, particularly in sensitive industries.
9. Standardization gaps: A lack of international auditing standards for blockchain complicates global adoption.
10. Skill requirements: Auditors need training in blockchain technologies, cryptographic methods, and AI-based analysis.

Organizations must weigh these risks carefully and develop governance frameworks to manage blockchain adoption responsibly.

7. Educational and professional implications

Blockchain adoption requires a shift in how auditors are trained and educated. Ballantine et al. (2024) emphasize that AI has already exposed the weaknesses in accounting education, particularly its overemphasis on technical compliance. Blockchain adds another dimension, demanding:

11. Technical expertise in blockchain protocols and auditing tools.
12. Analytical skills for interpreting AI-assisted blockchain audits.
13. Ethical awareness to balance transparency with confidentiality.
14. Critical thinking to evaluate blockchain evidence in complex regulatory contexts.

Universities, professional bodies, and audit firms must collaborate to redesign curricula and training programs that prepare auditors for blockchain-enabled environments.

8. Case study insights

The Big Four accounting firms illustrate blockchain's growing role in auditing:

15. PwC uses its Halo tool to audit digital assets, providing assurance in emerging cryptocurrency markets.
16. EY developed the Blockchain Analyzer to assist audit teams in reconciling blockchain-based transactions.
17. Deloitte has launched blockchain plug-and-play solutions under its Rubix division.
18. KPMG collaborates with tech companies like Microsoft and R3 to provide blockchain-based audit services.

These developments highlight how blockchain is no longer experimental but actively embedded in audit practices. Smaller firms and regulators are also beginning to explore blockchain-based assurance, signaling widespread future adoption.

9. Strategic Takeaways For Auditors

19. Adopt blockchain proactively as a tool for improving audit efficiency and transparency.
20. Leverage AI-blockchain integration to automate anomaly detection and risk assessment.
21. Address regulatory challenges by participating in the development of international standards.
22. Invest in training and education to build digital literacy among auditors.

10. CONCLUSION

Blockchain is redefining the future of auditing. By enabling real-time assurance, immutable records, and continuous auditing, it addresses many of the shortcomings of traditional audit methods. Its integration with AI further strengthens auditors' ability to detect fraud, monitor compliance, and provide timely assurance. However, blockchain adoption also introduces challenges related to scalability, privacy, legal liability, and the skills gap. To realize its full potential, the auditing profession must embrace technological innovation while simultaneously reforming education, standardization, and ethical frameworks. Blockchain in auditing is not a replacement for professional judgment but an enabler of more reliable, transparent, and trustworthy assurance.

A STUDY ON UNDERSTANDING THE EFFECTS OF REMOTE WORK AND EMPLOYEE LAYOFF AND ITS IMPACT ON EMPLOYEE WELL-BEING IN SELECTED IT SECTORS WITH REFERENCE TO BANGALORE CITY

Dr. Teena Jaculin G
Associate Professor, Department of Management Studies & Research
Ms. Shalini M
Assistant Professor, Department of Management Studies & Research
Don Bosco Institute of Technology, Bangalore

Abstract
The rapid adoption of remote work in the IT sector, accelerated by global disruptions and technological advancements, has significantly transformed employee experiences and organizational dynamics. Alongside this shift, employee layoffs have emerged as a critical concern, affecting job security, mental health, and overall well-being. This study aims to explore the combined effects of remote work and employee layoffs on employee well-being in selected IT companies in Bangalore city. By analyzing factors such as work-life balance, stress, communication challenges, and job satisfaction, the research investigates how remote work environments and layoffs impact employees' mental, emotional, and physical health. Data collected from surveys and interviews with IT professionals provides insights into coping mechanisms, organizational support systems, and areas requiring intervention. The findings of this study contribute to understanding the complexities of modern work arrangements and offer recommendations for organizations to create supportive, resilient work environments that prioritize employee well-being while adapting to changing workforce realities.
Keywords:Remote Work, Employee Well-Being, IT Sector, Layoff, Organizational Support

INTRODUCTION

The global shift towards remote work, accelerated by technological advancements and recent global events, has significantly altered traditional work environments, particularly in the Information Technology (IT) sector. As organizations adapt to flexible work arrangements, remote work has become a vital component in ensuring business continuity and employee engagement. While remote work offers benefits such as reduced commuting time, increased autonomy, and flexible schedules, it also presents challenges that can affect employee well-being.

Employee well-being, encompassing physical health, mental health, job satisfaction, and social connectedness, plays a critical role in sustaining productivity and organizational performance. In the IT sector, where knowledge-based work, long hours, and high cognitive demands are common, maintaining well-being in a remote setting has become an essential managerial concern.

Simultaneously, the sector has faced waves of employee layoffs due to market uncertainties, project cancellations, or cost optimizations. Layoffs contribute to job insecurity, anxiety, and disruptions in employees' personal and professional lives. The dual pressures of adapting to remote work environments while coping with layoffs have intensified the concerns surrounding employee well-being.

Problem statement:

Remote work as a research topic has been around for decades, providing many sources, mainly from around the 1990s. Employee well-being emerges as a critical business issue when employees work remotely. Although flexibility and autonomy have been generally

connected with better job satisfaction in remote work setting. However, due to the widespread shifts and changes that remote work policies have experienced because of the pandemic, many of those sources are not applicable today. Along with that there have been significant employee layoffs across the IT sector in recent years, with major companies like Microsoft, Intel, TCS and Infosys cutting jobs due to economic pressures, restructuring, and the integration of artificial intelligence. This study aims to explore these effects through qualitative research methods, providing a comprehensive understanding effects of remote work's and employee layoff and its impact on employee mental well-being in the selected IT sector of Bengaluru.

Objectives of the study:

- To understand the effects of remote work and employee layoffs and its impact on employee well being in selected IT companies of Bengaluru
- To know about the various factors which influence employee well-being in IT companies.

Theoretical frame work:

Moderating effects between remote work, layoff and employee well-being – Developing a theoretical framework using the self-determination theory.

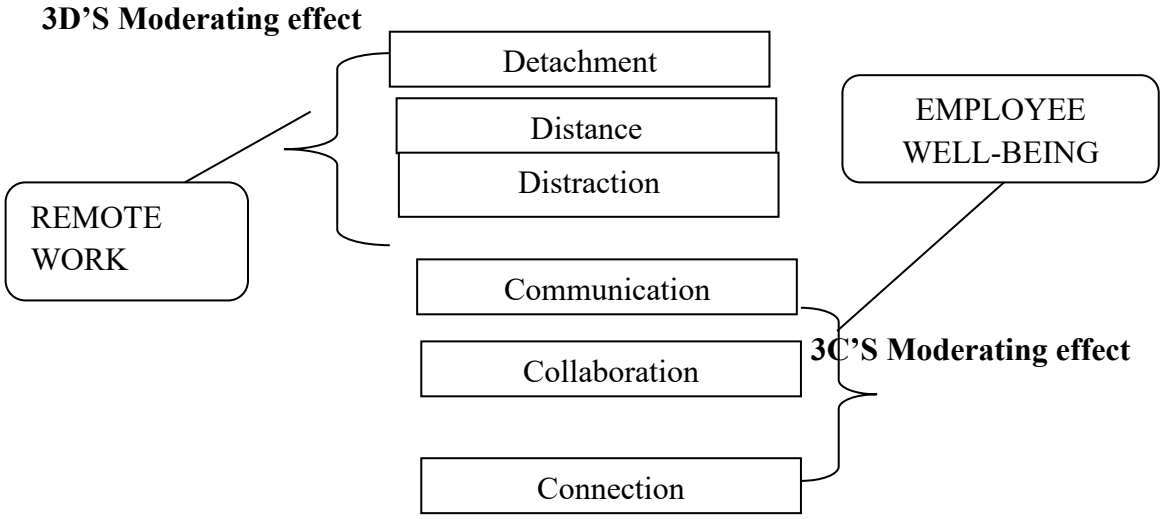

Fig 1.1Frame work using self determination theory

In the context of remote work and employee well-being, the 3D's (Detachment, Distance, Distraction) and 3C's (Communication, Connection, Collaboration) offer important insights into how work environments influence mental health and productivity. The 3D's highlight the challenges remote workers face: Detachment, where employees struggle to separate work from personal life, leading to stress and burnout; Distance, which refers to the physical and emotional gap between employees and their teams, contributing to feelings of isolation; and Distraction, where home environments or multitasking reduce focus and efficiency. On the other hand, the 3C's represent strategies that support well-being and performance: Communication, ensuring clarity and regular feedback; Connection, fostering relationships and emotional support; and Collaboration, promoting teamwork and shared goals even in virtual settings. Balancing these challenges and strategies helps create a healthier remote work environment, where employees feel engaged, supported, and capable of maintaining both productivity and psychological well-being.

Review of literature:

1) Deci and Ryan developed Self-Determination Theory, which posits that autonomy, competence, and relatedness are essential for fostering intrinsic motivation and psychological well-being in various settings, including workplaces.
2) Donthu et al., 2021 This study aimed to fill this gap in the literature by examining the relevant contributions in the field from a bibliometric perspective and complementing it with a content analysis of all gathered articles. Bibliometric analysis focuses on performance analysis of metadata and scientific mapping that establishes existing thematic and collaboration networks.
3) McPhail et al., 2024 Digital transformation processes, along with globalization, have helped expand the emergence of distributed virtual teams, where individuals have to work collaboratively despite being geographically dispersed.
4) Wang, Liu, Qian, and Parker (2020), during the COVID-19 pandemic, Wang et al. observed that remote work helped reduce commuting stress and offered greater flexibility. However, employees with limited access to technological resources and poor communication from management experienced anxiety and disengagement.
5) Oakman, Kinsman, Stuckey, Graham, and Weale (2020), This systematic review identified physical and mental health concerns related to remote work, including musculoskeletal disorders, fatigue, and increased psychological distress. The study emphasized the need for organizational interventions to support remote workers.
6) Hewitt, Flett, and Ediger (2024), this recent study explored layoff-related anxiety in organizations and reported that over 50% of employees feared job loss. The uncertainty significantly contributed to increased stress and deteriorating well-being.
7) Huang, Ye, and Chen (2023), have explored the relationship between remote work arrangements and employee well-being during the pandemic, identifying autonomy and competence as key moderators that enhanced motivation and mental health despite isolation challenges.
8) Park and Lee (2024), this research found that employees with high levels of perceived organizational support reported better coping mechanisms during layoffs. The study highlighted how relatedness and communication could buffer the psychological effects of job insecurity.
9) Smith, Johnson, and Patel (2025), the authors examined how SDT moderates the relationship between remote work stressors and employee outcomes. Their findings suggest that when organizations actively promote autonomy and relatedness, employees are less likely to experience distress despite workload pressures.
10) Kumar and Rao (2025), in a study conducted in India's IT sector, Kumar and Rao confirmed that fulfilling psychological needs through supportive leadership, flexible work arrangements, and skill-building initiatives led to improved job satisfaction and reduced anxiety in the face of layoffs and remote work challenges.

Gaps Identified in the Literature

- Existing studies have primarily focused on either remote work or layoffs separately, with few examining how both factors interact.
- The moderating role of autonomy, competence, and relatedness as conceptualized in SDT has not been systematically explored in relation to both remote work and layoffs.
- Research specific to developing economies, particularly India's IT sector, remains limited and warrants further investigation.
- Longitudinal studies are needed to understand the prolonged effects of remote work and layoffs on employee well-being.

Research Methodology

This study follows a theoretical research methodology, aiming to develop a framework that explains the moderating effects of Self-Determination Theory (SDT) on the relationship between remote work, layoffs, and employee well-being. Rather than collecting empirical data, this research relies on critical analysis and synthesis of existing literature, models, and theories. The study adopts a exploratory, and integrative approach, focusing on how established psychological theories, especially SDT, can be applied to understand contemporary organizational challenges such as remote work and layoffs. Secondary Data was collected from selected Industry reports and white papers discussing trends in the IT sector, especially in Bangalore. Case studies and organizational reports documenting the effects of layoffs and remote work on mental health and productivity.

Findings:

The study's findings reveal that remote work enhances employees' autonomy, improving their sense of control and motivation, while reduced social interaction contributes to isolation and stress. Layoffs increase job insecurity and weaken trust in management, but access to skill-building initiatives strengthens employees' competence, helping them handle uncertainties. However, the combined effects of remote work and layoffs intensify stress and burnout. Transparent communication from leadership alleviates uncertainty, fostering trust and engagement, while supportive practices such as flexible scheduling and mentorship enhance resilience and overall job satisfaction during periods of disruption. These findings highlight the moderating role of autonomy, competence, and relatedness in sustaining employee well-being amid organizational changes.

Conclusion:

In conclusion, this theoretical study suggests that Self-Determination Theory offers a valuable lens for understanding how remote work and layoffs impact employee well-being, with autonomy, competence, and relatedness acting as critical moderating factors that can either buffer or intensify stress and uncertainty. By integrating existing research and psychological frameworks, the study provides a conceptual model that organizations, especially in the IT sector in Bangalore, can adopt to better support their employees during times of change. It is recommended that organizations prioritize transparent communication, flexible work arrangements, skill development, and social support to address employees' psychological needs and enhance resilience. Future empirical research is encouraged to test and refine the proposed framework, enabling deeper insights into how organizational practices can promote well-being in dynamic and uncertain work environments.

Research Scholar, A.V.P. College of Arts and Science (Co-Education), Tirupur

ABTRACT
The banking sector serves as the foundation of a nation's financial framework, facilitating capital formation, credit generation, and ongoing economic development. In India, private sector banks have been instrumental in improving customer service, fostering digital innovation, and promoting financial inclusion. Established in 1993, Axis Bank has risen to prominence as a leading private sector bank, providing a wide range of services across retail, corporate, and digital channels. This study analyzes the financial performance of Axis Bank through ratio analysis, focusing on three important metrics: Return on Assets (ROA), Return on Equity (ROE), and Earnings Per Share (EPS). These ratios offer valuable insights into the bank's profitability, effective utilization of shareholders' equity, and overall value creation for investors, providing a comprehensive understanding of its financial position. The study uses secondary data sourced from Axis Bank's annual reports and Reserve Bank of India publications for the period 2020 to 2024. The findings are illustrated using tables and graphs, and interpretations link the financial results to the bank's strategic decisions and prevailing market conditions.

1.INTRODUCTION:
The Indian banking industry has experienced considerable changes over the last thirty years, propelled by privatization, technological progress, and regulatory changes. In particular, private sector banks have played a vital role in improving customer service, launching innovative products, and fostering financial literacy. Axis Bank, recognized as one of the foremost private banks, has built a strong foothold in retail, corporate, and digital banking.

Axis Bank was incorporated in 1993 as UTI Bank and later rebranded as Axis Bank in 2007. It is India's third-largest private sector bank in terms of assets, with a presence in both domestic and international markets. The bank caters to retail, corporate, and SME clients, while also being a pioneer in digital banking. With a network of thousands of branches and ATMs across the country, Axis Bank has contributed significantly to expanding financial accessibility.

In addition to traditional banking, Axis Bank is actively involved in wealth management, insurance distribution, and investment banking. The bank is also recognized for its corporate social responsibility initiatives in areas like education, health, and financial literacy.

2.Objectives Of The Study
1. To evaluate Axis Bank's profitability using Return on Assets
2. To measure shareholders' value creation through Return on Equity
3. To analyze investor performance and earnings potential using Earnings per Share

2.1 Review Of Literature

- A Comparative Study of AXIS Bank and ICICI Bank- Deepak Kumar Adhana1 and Dr. Neelam Gulati2- Studies show that financial performance helps to judge how strong banks are. Ratios like return on equity, capital adequacy, and debt levels are mostly used. Axis and ICICI, as private banks, show faster growth than public banks. ICICI earns more profit, while Axis uses equity more efficiently
- Deepak Kumar Adhana1 and Dr. Neelam Gulati2 analyzed the financial performance of axis bank and ICICI bank the author conclude it ICICI bank performance is better than Axis bank

3.Research Methodology

3.1 Research Design

The study adopts a descriptive research design, focusing on secondary data from published sources. the purpose is to describe, interpret, and evaluate Axis Bank's financial performance.

3.2 Data Collection

The study is based on secondary data obtained from Axis Bank's annual reports, RBI publications, and financial research reports. The analysis focuses on the period from 2021 to 2025. Key variables used for calculations include net profit, equity share, and total assets.

3.3 Tools of Analysis

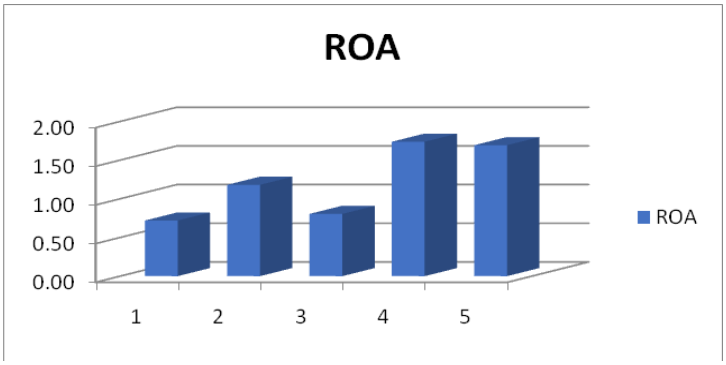
- Return on Assets (ROA): Profitability.
- Return on Equity (ROE): Efficiency in using shareholders' funds.
- Earnings Per Share (EPS): Shareholder wealth creation.

3.4 Scope of the Study

1. The study focuses solely on Axis Bank and does not include comparisons with other banks. The three ratios chosen cover essential dimensions of performance, but they may not capture the entire financial picture.

3.5 Limitations

1. Restricted to five years of data.
2. Based only on published secondary data.



4.Data Analysis And Interpretation

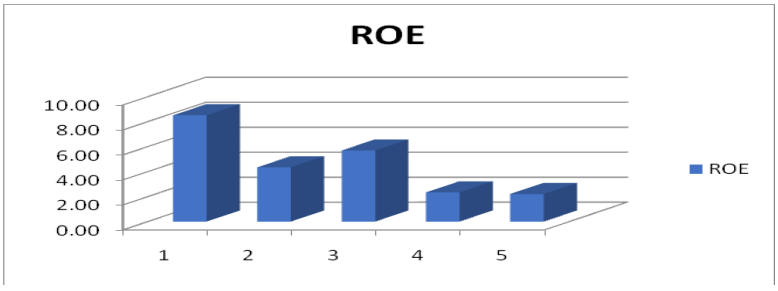
(i) Return On Assets

Return on Assets measures how effectively a company uses its assets to generate profit. It is calculated by dividing the company's net profit by its total assets. ROA indicates the efficiency of asset utilization in earning profits. A higher ROA shows that the company is managing its resources well. It helps investors compare performance across companies.

Formula : ROA = (Net Profit ÷ Total Assets) × 100.

S.NO	YEAR	NET PROFIT	TOTAL ASSETS	ROA
1	2021	7195.5	1001005	0.72
2	2022	14119.29	1195779	1.18
3	2023	10818.45	1344418	0.80
4	2024	26386.2	1518239	1.74
5	2025	28055.11	1656962.61	1.69

Interpretation



The data shows that the company's assets have grown steadily from 2021 to 2025. Net profit increased in 2022, dropped in 2023, and then rose sharply in 2024 and 2025. The rise in assets shows the financial position is getting stronger each year. ROA moved with profit changes, improving in 2022, falling in 2023, and peaking in 2024. In 2025, ROA slightly reduced but remained strong compared to earlier years. Overall, the company is growing well, with good asset expansion and stable profitability.

(ii) Return on Equity (ROE)

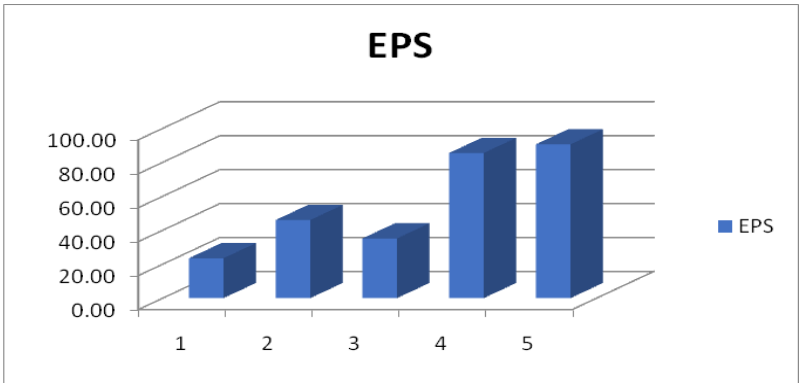
Return on Equity (ROE) measures how effectively a bank uses shareholders' funds to generate net profit.It shows the return earned on the capital invested by equity holders. A higher ROE indicates efficient utilization of equity and better value creation for investors.It is a key profitability ratio closely monitored by shareholders and analysts.

Formula: ROE=Shareholders Equity/ Net Profit×100.

S.NO	YEAR	SHARE HOLDER EQUITY	NET PROFIT	ROE
1	2021	612.75	7195.5	8.52
2	2022	613.95	14119.3	4.35
3	2023	615.37	10818.5	5.69
4	2024	617.31	26386.2	2.34
5	2025	619.47	28055.11	2.21

Interpretation

The number of shareholders has increased slowly from 2021 to 2025. Net profit went up in 2022, fell in 2023, and then rose strongly in 2024 and 2025. CDR shows a steady fall over the years, coming down from 8.52 in 2021 to 2.21 in 2025. This means the company is earning more profit with less strain on shareholders. The growth in profit along with falling



CDR shows better efficiency in performance. Overall, the company is improving well with steady shareholder growth and strong profits.

(iii) Earnings per Share

Earnings per Share (EPS) shows how much profit is earned for each equity share of the company. It is calculated by dividing the net profit after tax by the number of equity shares. A higher EPS indicates better profitability and stronger returns for investors. Thus, EPS is widely used by shareholders to judge the financial health and growth potential of a bank.

Formula: Earnings per Share = Number of Equity Shares/ Net Profit after Tax

S.NO	YEAR	NO OF SHARE	NET PROFIT AFTER TAX
1	2021	306.38	7195.5
2	2022	306.98	14119
3	2023	307.69	10818
4	2024	308.66	26386
5	2025	309.74	28055

Interpretation

The analysis of Axis Bank's Earnings Per Share (EPS) reveals a consistent upward trend during the study period, except for a slight dip in 2023. EPS rose from ₹23.49 in 2021 to ₹90.58 in 2025, indicating strong growth in shareholder value. The sharp increase in 2022 and 2024 reflects improved profitability and efficient capital utilization, while the 2023 decline highlights fluctuations in earnings performance. Overall, the rising EPS demonstrates the bank's strengthening financial position and enhanced returns to equity shareholders.

5. Findings And Suggestions:

Findings

1. ROA improved overall, rising from 0.72% in 2021 to 1.74% in 2024, though it showed fluctuation (dropped in 2023). This indicates mixed efficiency in using assets for generating profits.
2. ROE shows a continuous decline, from 8.52% in 2021 to just 2.21% in 2025, reflecting weaker utilization of shareholders' equity despite profit growth.
3. EPS has steadily increased from 23.48 (2021) to 90.59 (2025), showing consistent value creation for shareholders in terms of per-share earnings.

Suggestions

1. Axis Bank should improve equity management to reverse the declining ROE and ensure that profits are effectively converted into higher equity returns.
2. Focus on asset quality and risk management to maintain stable ROA, ensuring sustainable profitability.

CONCLUSION

The performance analysis of Axis Bank using ROA, ROE, and EPS shows mixed results over the study period. ROA improved overall, reflecting better use of assets, though with some fluctuations. ROE, however, declined steadily, indicating that the bank is not utilizing shareholders' equity as effectively as before. On the positive side, EPS showed consistent growth, proving that shareholder value is increasing year by year. These results suggest that while profitability and earnings per share are strengthening, equity efficiency remains a concern. To sustain growth, Axis Bank must focus on improving equity management and maintaining asset quality, ensuring both stability and long-term profitability.

DIGITAL MARKETING

Dr. M. Latha
Assistant Professor Department of Commerce,
PTA Government Arts and Science College, Palladam

INTRODUCTION:

Digital marketing is the part of marketing that promotes goods and services via the Internet and online-based digital technology including smart phones, desktop computers, and other digital media and platforms. Digital advertising has increased since 1995 at the expense of print media, according to advertising income as a percentage of US GDP. The way that companies and brands use technology for marketing has changed dramatically between the 1990s and 2000s. Digital marketing efforts, which use a variety of techniques, have become commonplace as digital platforms are increasingly integrated into marketing strategies and daily life and as individuals use digital devices more frequently rather than going to physical stores . Search engine marketing (SEM), search engine optimization (SEO), content marketing, influencer marketing, content automation, campaign marketing, data-driven marketing, e-commerce marketing, social media marketing, social media optimization, e-mail direct marketing, display advertising, e-books, and optical disks and games are a few of these techniques. Digital marketing extends to online platforms that offer digital media, including television, mobile phones (SMS and MMS), callbacks, and mobile ringtones for on-hold messages. The extension to non-Internet channels differentiates digital marketing from online marketing.

Scope of the Study

The scope of this study focuses on exploring the various aspects, tools, and strategies of **digital marketing** and their impact on business growth and consumer engagement. It examines how digital marketing channels—such as social media, search engines, email, and websites—are used to promote products and services effectively in both local and global markets.

his study covers the following key areas:

- **Understanding core components** of digital marketing, including SEO, social media marketing, content marketing, email marketing, and paid advertising.

- **Analyzing consumer behavior** in the digital environment and how it influences marketing strategies.
- **Evaluating the effectiveness** of digital marketing campaigns in achieving brand awareness, customer retention, and sales growth.
- **Identifying challenges and opportunities** faced by businesses in adopting digital marketing practices.

The study is limited to online marketing practices and does not include traditional marketing methods such as print, radio, or television advertising. It aims to provide insights that can help businesses, marketers, and students understand how digital tools and strategies can be leveraged for competitive advantage in the modern marketplace.

Statement of the Problem

In today's digital era, businesses are increasingly shifting from traditional marketing methods to digital platforms. However, many organizations—especially small and medium-sized enterprises (SMEs)—struggle to effectively implement digital marketing strategies due to limited knowledge, resources, and technical expertise.

Despite the growing importance of online engagement, several problems persist:

- Many businesses lack a clear understanding of which **digital marketing tools and channels** are most effective for their target audience.
- There is often a **gap between digital marketing investment and measurable results**, making it difficult to assess the return on investment (ROI).
- Rapid changes in digital trends and technologies lead to **challenges in keeping marketing strategies up to date**.
- Some companies face difficulties in **analyzing consumer data** and using it to create personalized marketing campaigns.

Therefore, this study aims to investigate how digital marketing strategies can be effectively utilized to enhance brand visibility, customer engagement, and business performance. It also seeks to identify the common barriers preventing businesses from achieving optimal results through digital marketing.

History

Effective digital marketing started in 1990 with the creation of the Archie search engine as an index for FTP sites. vast amounts of consumer data could already be stored on computers in the 1980s due to their vast storage capacities. Businesses began utilizing online strategies like database marketing as opposed to brokers of limited lists. Databases helped businesses better track client information, which changed the buyer-seller relationship.

The term "digital marketing" was first used in the 1990s. In 1994, AT&T launched the "YouWill" campaign, the first clickable ban, and over the first four months, 44% of consumers who clicked on the button fell Early digital marketing initiatives concentrated on basic HTML websites and the rapidly growing email marketing technique, which made it possible to communicate directly with customers. Customers started looking for items and deciding on their needs online rather than speaking with a salesperson in the 2000s due to the rise in Internet users and the introduction of the iPhone, which presented a new challenge for a company's marketing department. Furthermore, the majority of retailers still had to register their own domain address, according to a 2000 UK poll. Marketers were prompted by these issues to come up with innovative strategies to incorporate digital technology into market

development. At the same time, Google AdWords introduced pay-per-click (PPC) advertising in 2000, which made digital marketing more quantifiable and economical by enabling firms to target specific keywords.

Social media sites including Facebook (2004), YouTube (2005), and Twitter (2006) began to appear in the mid-2000s. These platforms enabled direct and interactive consumer involvement, revolutionizing digital marketing. Marketing automation was created in 2007 in response to the constantly changing marketing environment. The technique of using software to automate traditional marketing procedures is known as marketing automation. Businesses can use marketing automation to segment their clientele, start multichannel marketing campaigns, and give them tailored information according on their individual activity. In this manner, a personalized message tailored to the individual on their preferred platform is triggered by their activity—or lack thereof. Notwithstanding the advantages of marketing automation, many businesses are finding it difficult to appropriately integrate technology into their daily operations.

Non-linear marketing approach

A long-term marketing strategy that relies on companies gathering data on Internet users' online behaviors and attempting to be visible in a variety of places is non-linear marketing, a subset of interactive marketing. Nonlinear digital marketing strategies focus on addressing potential customers through a variety of online channels, in contrast to traditional marketing methods that use direct, one-way communications to consumers (through print, television, and radio advertising). This shift, along with increased consumer awareness and the need for more advanced consumer products, has compelled many companies to reevaluate their outreach plans and implement corporate omnichannel, nonlinear marketing strategies in order to sustain adequate brand exposure, engagement, and reach. Instead of targeting a broad, cohesive audience, nonlinear marketing tactics try to customize the advertising for various channels and specific consumers.

Tactics may include:

- ✓ Search engine optimization (SEO)
- ✓ Social media marketing
- ✓ Video marketing
- ✓ Email marketing
- ✓ Blogging & affiliate marketing
- ✓ Website marketing
- ✓ Pay-per-click Content marketing
- ✓ Search engine marketing
- ✓ Social media optimization

According to some research, companies are finding it harder to forecast how customers would react to conventional marketing strategies. A 2018 study found that almost 90% of American internet shoppers looked up brands and items online before going to a store or making a purchase. The Global Web Index estimated that in 2018, a little more than 50% of consumers researched products on social media. Businesses often rely on individuals portraying their products in a positive light on social media, and may adapt their marketing strategy to target people with large social media followings in order to generate such comments. In this manner, businesses can use consumers to advertise their products or services, decreasing the cost for the company.

Brand awareness

Increasing brand awareness—the degree to which consumers and the general public are aware of and familiar with a specific brand—is one of the main goals of contemporary digital marketing. Because it affects customer decision-making and brand perception, increasing brand recognition is crucial in digital marketing and marketing in general. According to the 2015 essay, "Impact of Brand on Consumer Behavior": "Brand awareness, as one of the fundamental dimensions of brand equity, is often considered to be a prerequisite of consumers' buying decision, as it represents the main factor for including a brand in the consideration set. Because they are familiar with the brand and its attributes, consumers' perceived risk assessment and confidence in the purchase choice can also be influenced by brand awareness.

According to recent trends, companies and digital marketers are placing a higher priority on brand awareness and concentrating more of their digital marketing efforts on building brand recall and recognition than in former years. A 2019 survey by the Content Marketing Institute supports this, revealing that 81% of digital marketers have worked on enhancing brand recognition over the past year. Another Content Marketing Institute survey revealed that 89% of B2B marketers now believe improving brand awareness to be more important than efforts directed at increasing sales.

Online methods used to build brand awareness

Using one or more online channels and (omnichannel) tactics to raise customer brand recognition is one example of a digital marketing strategy.

The following techniques and resources may be used to increase brand awareness:

Optimization of search engines (SEO)

Business websites and brand-related material can be made more visible for popular industry-related search queries by using SEO strategies. The expanding impact of search results and search features like knowledge panels, local SEO, and highlighted snippets on consumer behavior is seen to be related to the significance of SEO in raising brand awareness.

Marketing through search engines (SEM)

SEM, also known as PPC advertising, involves the purchase of ad space in prominent, visible positions atop search results pages and websites. Search ads have been shown to have a positive impact on brand recognition, awareness and conversions. 33% of searchers who click on paid ads do so because they directly respond to their particular search query.

Social media marketing

Constant customer involvement, with a focus on content generation and interaction abilities, is what defines social media marketing. It entails using tools like Hoot suite or Sprout Social to monitor, analyze, summarize, and manage the marketing process in real time. which encourage these initiatives and enable modifications to marketing plans in response to immediate market and customer feedback. Increasing brand awareness is the top objective for 70% of marketers when it comes to social media marketing. Due to its professional networking features, LinkedIn has emerged as one of the most popular social media sites among business executives as of 2021.

Content marketing

56% of marketers believe personalization content – brand-centered blogs, articles, social updates, videos, landing pages – improves brand recall and engagement.

Developments and strategies

The "emergence of digital marketing" was one of the significant shifts in traditional marketing, and as a result, marketing tactics had to be redesigned to accommodate this significant shift. Given that digital marketing relies on rapidly changing and ever-evolving technology, one should anticipate that its innovations and tactics will also exhibit these characteristics. This section attempts to list the notable current highlights in use (at the time of writing).

Segmentation:

In digital marketing, segmentation has received more attention in order to target particular markets in both the business-to-business and business-to-consumer sectors.

Influencer marketing:

Influencers, or significant nodes, are found in associated communities. In terms of digital targeting, this idea is growing in importance. Influencers allow brands to take advantage of social media and the large audiences available on many of these platforms.

Online behavioral Advertising

It is possible to reach influencers via paid advertising, such as Face book Advertising or Google Ads campaigns, or through sophisticated CRM (social customer relationship management) software, such as SAP C4C, Microsoft Dynamics, Sage CRM and Sales force CRM. Many universities now focus, at Masters level, on engagement strategies for influencers.

To summarize, Pull digital marketing is characterized by consumers actively seeking marketing
content while Push digital marketing occurs when marketers send messages without that content
being actively sought by the recipients.

Game advertising:

Adverts that appear in computer or video games are known as game adverts. Billboards that display during sporting events are among the most prevalent instances of in-game advertising.

Additionally, in-game advertisements may show up as well-known brands of apparel, vehicles, or firearms that are available as emblems for gaming status.

Six principles for building online brand content:

1. Do not consider individuals as consumers;
2. Have an editorial position;
3. Define an identity for the brand;
4. Maintain a continuity of contents;
5. Ensure a regular interaction with audience;
6. Have a channel for events.

Tourism marketing:

Advanced tourism, responsible and sustainable tourism, social media and online tourism marketing, and geographic information systems. As a larger area of study develops, more thorough and varied scholarly inquiry is drawn to it. The new digital era has enabled brands to selectively target their customers that may potentially be interested in their brand or based on previous browsing interests. Businesses can use social media to select the age range, location, gender, and interests of whom they would like their targeted post

to be seen. Furthermore, based on a customer's recent search history they can be 'followed' on the internet so they see advertisements from similar brands, products, and services, that allows
businesses to target the specific customers that they know and feel will most benefit from their product or service, something that had limited capabilities up until the digital era.

Benefits of digital marketing

Digital marketing may have the following advantages:

1. it provides all necessary information at any time and/or location,
2. outperforms internet marketing, and offers alternatives without requiring the internet in terms of offering
3. advantageous features and methods that reach, educate, engage, offer, and sell services and goods to customers.
4. businesses can attain data that present target audiences based on their age, location, interests, and education
5. low investment, the cost per lead is 61% less expensive than traditional marketing
6. able to reach every mobile user, there are over 14 billion worldwide mobile devices and with a projection to grow to almost 18 billion by the year 2024

Strategy

Planning

Digital marketing planning is a term used in marketing management. It describes the first stage of forming a digital marketing strategy for the wider digital marketing system. The difference between digital and traditional marketing planning is that it uses digitally based communication tools and technology such as Social, Web, Mobile, Scan able Surface. Nevertheless, both are aligned with the vision, the mission of the company and the overarching business strategy

Stages of planning

Dr. Dave Chaffey, an author on marketing topics, has suggested that successful digital marketing strategies have do digital marketing planning (DMP), which is a three-stage approach: Opportunity, Strategy, and Action. This generic strategic approach often has phases of situation review, goal setting, strategy formulation, resource allocation and monitoring.

Opportunity

To create an effective DMP, a business first needs to review the marketplace and set "SMART" (Specific, Measurable, Actionable, Relevant, and Time-Bound) objectives. They can set SMARTobjectives by reviewing the current benchmarks and key performance indicators (KPIs) of the company and competitors. It is pertinent that the analytics used for the KPIs be customized to the type, objectives, mission, and vision of the company.

Action

The third and final stage requires the firm to set a budget and management systems. These must be measurable touch points, such as the audience reached across all digital platforms. Furthermore, marketers must ensure the budget and management systems are integrating the paid, owned, and earned media of the company. The Action and final stage of planning also requires the company to set in place measurable content creation e.g. oral, visual or written online media.

Sharing economy

The "sharing economy" refers to an economic pattern that aims to obtain a resource that is not fully used. Nowadays, the sharing economy has had an unimagined effect on many traditional elements including labor, industry, and distribution system. This effect is not negligible that some industries are obviously under threat. The sharing economy is

influencing the traditional marketing channels by changing the nature of some specific concept including ownership, assets, and recruitment.

E-mail – A form of direct marketing characterized as being informative, promotional, and often a means of customer relationship management. Organization can update the activity or promotion information to the user by subscribing the newsletter mail that happened in consuming. Success is reliant upon a company's ability to access contact information from its past, present, and future clientele.

Social Media –Social media has the capability to reach a larger audience in a shorter time frame
than traditional marketing channels. This makes social media a powerful tool for consumer engagement and the dissemination of information.

Search Engine Marketing or SEM –Requires more specialized knowledge of the technology
embedded in online platforms. This marketing strategy requires long-term commitment and dedication to the ongoing improvement of a company's digital presence.

Search Engine Marketing or SEM - calls for a deeper understanding of the technology used in internet platforms. This marketing approach necessitates sustained dedication to the continuous enhancement of a business's online visibility. Other emerging digital marketing channels, particularly branded mobile apps, have excelled in the sharing economy. Branded mobile apps are created specifically to initiate engagement between customers and the company. This engagement is typically facilitated through entertainment, information, or market transaction.

Conclusion

Digital marketing has revolutionized the way businesses reach and engage with their audiences. It provides powerful tools and strategies that allow organizations to connect with customers across the globe in real time. Unlike traditional marketing, digital marketing is data-driven, interactive, and adaptable, enabling brands to measure performance, understand customer behavior, and optimize campaigns for better results.In today’s digital era, a strong online presence is no longer optional—it’s essential. Businesses that effectively use digital marketing can build stronger customer relationships, increase brand awareness, and achieve sustainable growth. As technology and consumer habits continue to evolve, staying updated with the latest digital marketing trends and tools will remain key to long-term success.

ENHANCING USER EXPERIENCE: AN ANALYSIS OF SATISFACTION WITH SERVICE QUALITY IN E-SEVAI SERVICES

K. Deepika
Research Scholar in Commerce,
Dr. K. Pushpalatha
Associate Professor of Commerce, PG and Research Department of Commerce,
Chikkanna Government Arts College, Tiruppur

Abstract
E-governance has transformed public service delivery in India by ensuring efficiency, transparency, and accessibility. In Tamil Nadu, the Tamil Nadu e-Governance Agency (TNeGA) has pioneered this transformation through e-Sevai centres, which provide citizens with a one-stop platform for accessing government services. User satisfaction is a key determinant of the success of these centres.This study, based on primary data collected from 110 users through a structured questionnaire, evaluates satisfaction levels and influencing factors. Descriptive analysis, Chi-square tests, and multiple linear regression were employed. Results show that gender, education, and occupation significantly influence satisfaction, while age, income, and location do not. The regression model explained 74% of the variance (Adjusted $R^2 = 0.743$), with "faster than traditional offices" identified as the only significant predictor. The findings emphasize time efficiency as the most valued factor. Improved responsiveness, awareness campaigns, and inclusive outreach can further enhance user trust and adoption.
Keywords: *E-governance, e-Sevai Centres, User Satisfaction, Service Quality, Digital Governance*

INTRODUCTION

The growth of e-governance in India has redefined public service delivery by reducing bureaucratic hurdles and making government services more accessible to citizens. Tamil Nadu has been at the forefront of this transformation through the establishment of Tamil Nadu e-Governance Agency (TNeGA). TNeGA is the nodal agency responsible for designing, implementing, and monitoring e-governance initiatives across the state. One of its flagship projects is the e-Sevai centres, which provide citizens with a single-window facility to access multiple government services ranging from certificates, licenses, and utility payments to welfare schemes.By offering services digitally through e-Sevai centres, TNeGA aims to promote efficiency, transparency, and inclusivity in governance. However, the effectiveness of these services depends not only on availability but also on the level of user satisfaction. Satisfaction reflects the extent to which users feel their expectations are met in terms of service quality, speed, accessibility, and reliability. Therefore, assessing user satisfaction and identifying the key factors influencing it are essential for evaluating the success of TNeGA's initiatives and for strengthening digital governance in Tamil Nadu.

Statement of the Problem

Despite the government's efforts to deliver efficient services through e-Sevai centres, the actual experience of users varies across different demographic groups and service quality dimensions. Some users perceive these services as efficient and time-saving, while others report challenges such as delays, lack of awareness, or limited accessibility. Therefore, it becomes necessary to examine both user satisfaction levels and the factors influencing them to identify areas requiring improvement.

Review Of Literature

- **Uthaman, V.S. &Vasanthagopal, R. (2023)**, Key Success Factors for the e-Governance Initiatives Through Common Service Centres in India,analyzed CSCs with special reference to Kerala's Akshaya centres. It identified service quality, accessibility, and citizen trust as critical success factors for CSC performance. The study revealed that citizens valued efficiency and transparency in digital service delivery. It suggested that strengthening infrastructure and staff competency enhances satisfaction. This work is relevant as CSCs operate in parallel to e-Sevaicentres in delivering G2C services.
- **Sumathy, M. (2020),** Users Satisfaction Towards E-Governance Services in Coimbatore District, examined citizen satisfaction with e-governance services in Coimbatore. Results showed that accessibility and convenience were major strengths, while delays and lack of technical support lowered satisfaction. The author emphasized the need for transparency and efficiency in service delivery. The findings highlight digital literacy as an important factor in improving satisfaction. This study is relevant to Tamil Nadu and provides parallels for e-Sevai services.

Research Methodology

The study is based on primary data collected from 110 respondents through a structured questionnaire. A descriptive research design was adopted. Respondents were selected to represent diverse demographic groups including gender, age, education, occupation, income, and location. Statistical tools such as Chi-square tests were used to study the association between user profile and satisfaction. Multiple linear regression analysis was employed to identify the impact of service quality factors on overall user satisfaction.

Objective Of Study

1.To assess the overall satisfaction of users with e-Sevai services.
2.To examine users satisfaction across the dimensions of service quality at e-Sevai Centres.

Data Analysis And Interpretation

1.Profile of e-Sevai Service Users :

Table : 1 Profile of e-Sevai Service Users

PROFILE		**NO. OF RESPONDENTS**	**PERCENTAGE**
Gender	Male	64	58.18
	Female	46	41.81
	Total	**110**	**100**
Age	Below 20	25	22.72
	21-30	36	32.72
	31-40	18	16.36
	41 - 50	`17	15.45
	Above 50	14	12.72
	Total	**110**	**100**
Educational Qualification	No formal education	1	0.9
	School level	2	1.81
	Undergraduate	66	60
	Postgraduate	41	37.27

	Total	**110**	**100**
Occupation	Students	56	50.9
	Self-employed	26	23.63
	Salaried	24	21.81
	Homemaker	4	3.63
	Total	**110**	**100**
Income level	Below Rs.10,000	26	23.63
	Rs.10,001-Rs.20,000	43	39.09
	Rs.20,001-Rs.30,000	11	10
	Rs.30,001-Rs.40,000	7	6.36
	Rs.40,001-Rs.50,000	14	12.72
	Above Rs.50,000	9	2.72
	Total	**110**	**100**
Location	Rural	39	35.45
	Urban	60	54.54
	Semi-urban	11	10
	Total	**110**	**100**

Source: Primary data

- Out of 110 respondents, 64 (58.18%) are male and 46 (41.81%) are female. This indicates a higher participation of male users in availing e-seva services. The gender distribution shows that men are more inclined or perhaps better positioned to access these digital services than women.
- With respect to age, the majority of respondents belong to the **21–30 years** group (36 respondents or 32.72%), followed by those **below 20 years** (25 respondents or 22.72%). The remaining respondents are distributed across age groups: 31–40 years (16.36%), 41–50 years (15.45%), and above 50 years (12.72%). This highlights that **younger individuals**, particularly those under 30 age, are more active users of e-seva services. The gradual decline in usage with increasing age suggests that digital engagement is lower among older individuals.
- Educationally, a substantial proportion of the respondents are well-qualified: 66 (60%) are undergraduates, and 41 (37.27%) are postgraduates. Very few users have school-level education (1.81%) or no formal education (0.9%). This implies that **higher education levels positively correlate with the use of e-seva services**, as educated users are more comfortable navigating digital platforms.
- In terms of occupation, students form the largest user group with 56 (50.9%), followed by self-employed individuals (23.63%) and salaried employees (21.81%). Homemakers constitute a small fraction (3.63%). This pattern indicates that **students and working professionals** are more likely to utilize digital government services, while homemakers remain underrepresented, possibly due to limited access or digital familiarity.
- The income distribution shows that most users fall into the **Rs.10,001–Rs.20,000** income range (39.09%), followed by those earning **below Rs.10,000** (23.63%). Smaller segments belong to higher income brackets, including Rs.40,001–Rs.50,000 (12.72%) and above Rs.50,000 (2.72%). This suggests that **e-sevai services are most**

popular among lower to middle-income groups, who may rely more on affordable public digital services.

- Regarding location, a majority of users are from urban areas (54.54%), followed by rural (35.45%) and semi-urban areas (10%). This reflects **greater access and awareness in urban regions,** although rural participation is also notable, indicating a decent outreach of e-sevai services beyond cities.

2.Association between Profile of e-Sevai service Users and Level of Satisfaction

Table 2 : Result of Chi-square Test

Profile of e-Sevai service users and Level of Satisfaction	**Calculated value**	**Table value**	**DF**	**Inference**
Gender	59.381	13.277	4	Significant
Age	1.854	15.507	8	InSignificant
Educational Qualification	75.151	21.026	12	Significant
Occupation	93.228	21.026	12	Significant
Income Level	1.621	26.296	16	InSignificant
Location	1.597	15.507	8	InSignificant

Source: Primary data

To examine the association between users profile and their level of satisfaction of e-seva services, a Chi-square test was conducted. All associations were tested at the **5% level of significance**.

- The calculated Chi-square value is 59.381, which is higher than the table value of 13.277. There is a significant association between gender and satisfaction with e-Sevai services. Male and female respondents show different satisfaction levels, indicating a gender-based difference in service perception.
- The calculated Chi-square value is 1.854, which is lower than the table value of 15.507. There is no significant association between age and satisfaction with e-Sevai services. This implies that users across different age groups report similar levels of satisfaction.
- The calculated Chi-square value is 75.151, which is higher than the table value of 21.026. There is a significant association between educational qualification and satisfaction with e-Sevai services. Respondents with different levels of education show varied satisfaction, suggesting that education influences awareness and usage.
- The calculated Chi-square value is 93.228, which is higher than the table value of 21.026. There is a significant association between occupation and satisfaction with e-Sevai services. Different occupational groups perceive and experience services differently.
- The calculated Chi-square value is 1.621, which is lower than the table value of 26.296. There is no significant association between income level and satisfaction with e-Sevai services. This shows that satisfaction levels remain fairly consistent across different income groups.

- The calculated Chi-square value is 1.597, which is lower than the table value of 15.507. There is no significant association between location and satisfaction with e-Sevai services. Users from both rural and urban areas report similar satisfaction levels.

Multiple Linear Regression Analysis

Multiple linear regression is a statistical technique used to analyze the relationship between one dependent variable and several independent variables. In this study, user satisfaction with e-Sevai services is the dependent variable, while the various service quality factors act as independent variables.

3. Multiple Linear Regression Analysis of Service Quality Factors Influencing User Satisfaction

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.877[a]	0.769	0.743	0.475

ANOVA

	Process is easy to follow.	-0.055	0.189	-0.089	-0.291	0.772
	Centres are conveniently located.	-0.066	0.204	-0.101	-0.322	0.748
	Services are reliable.	0.151	0.239	0.232	0.631	0.53
	Personal data is secure.	0.347	0.244	0.53	1.421	0.159

	System is safe from misuse.	0.016	0.285	0.024	0.055	0.956
	Staff are knowledgeable.	-0.126	0.291	-0.194	-0.435	0.665
	Services are timely	0.044	0.282	0.068	0.155	0.877
	Faster than traditional offices	0.495	0.139	0.718	3.569	0.001
	Charges are transparent.	-0.391	0.298	-0.601	-1.314	0.192
	No extra fees applied.	0.076	0.216	0.119	0.353	0.725
	Waiting time is minimal	0.117	0.215	0.175	0.546	0.586

Source: Primary data

The regression model was statistically significant ($F = 29.678$, $p < 0.001$) and explained 74% of the variation in user satisfaction with e-Sevai services (Adjusted $R^2 = 0.743$). Among the predictors, "Faster than traditional offices" emerged as the strongest and only significant factor ($\beta = 0.718$, $p < 0.01$). Other factors such as ease of process, security, reliability, transparency, and staff knowledge did not have a significant impact. This indicates that the key driver of satisfaction is the time efficiency of e-Sevai services compared to traditional service delivery methods.

Findings

- Chi-square analysis revealed significant associations between satisfaction and gender, education, and occupation, while age, income, and location showed no significant associations.
- Regression analysis demonstrated that the model explained 74% of the variation in user satisfaction (Adjusted $R^2 = 0.743$).
- Among the service quality dimensions, only "Faster than traditional offices" emerged as a significant predictor of user satisfaction ($\beta = 0.718$, $p = 0.001$).

Suggestions

- Time efficiency is the strongest driver of satisfaction, improving processing speed should remain the top priority.
- Special focus can be given to increasing awareness among women, homemakers, and less-educated groups to enhance inclusivity.
- Training staff to improve responsiveness and knowledge can indirectly enhance satisfaction even if not statistically significant in this study.

CONCLUSION

This study analyzes user satisfaction with services delivered at e-Sevai centres under the Tamil Nadu e-Governance Agency (TNeGA). Findings show that younger, educated, and urban citizens are the primary users, while older groups, women, and homemakers remain underrepresented. Chi-square tests revealed that gender, education, and occupation significantly influence satisfaction, whereas age, income, and location do not. Regression analysis identified "faster than traditional offices" as the only significant predictor, highlighting the importance of time efficiency. To enhance user experience, centres must

reduce delays, ensure prompt processing, and expand outreach to underrepresented groups, strengthening citizen-centric digital governance.

INFLUENCE OF INTERNATIONAL WEB SERIES ON VIEWER ENGAGEMENT AND SUBSCRIPTION CHOICES IN OTT PLATFORMS

V. Kaviya
Ph.D. Research Scholar in Commerce
Dr. C. Amirtharani
Associate Professor of Commerce, PG and Research Department of Commerce, Chikkanna Government Arts College, Tiruppur.

Abstract
The rapid expansion of OTT platforms has revolutionised entertainment consumption, with international web series becoming a significant driver of viewer engagement and subscription decisions in India. Despite their growing popularity, limited research exists on how demographic factors influence this trend. Addressing this gap, the research examines the motivations behind watching international content and its impact on subscription choices and renewal intentions. The primary data collected from 110 OTT users in Tiruppur were analysed using ANOVA and Garrett ranking techniques. The findings highlight that the international series as the primary subscription motive, with demographics significantly affecting the plan preferences. The key engagement factors include compelling storylines and favourite actors, underscoring the need for personalised content strategies by OTT providers.
Keywords: OTT platforms, international web series, viewer engagement, subscription behaviour, demographic analysis

1.INTRODUCTION

The OTT (Over-The-Top) platforms have fundamentally transformed how audiences access and consume entertainment content, providing direct, flexible, and personalised viewing experiences across a range of devices. These digital platforms bypass traditional cable or satellite systems, making premium, on-demand media including films, series, documentaries, and live events available via streaming at any time and from any location. The rapid advancements in internet infrastructure, affordable mobile data, and the proliferation of smart devices have made OTT platforms of new-age media consumption in India, especially among younger and urban viewers. Within the expanding of OTT platforms, international web series have emerged as a powerful catalyst for viewer engagement and subscription choices. These global narratives offer distinctive storytelling styles, high production values, and cultural variety, captivating Indian audiences seeking contents beyond regional and national boundaries. As the popularity of international web series rises, OTT platforms are increasingly driven to diversify their libraries and invest in high-quality overseas content to attract and retain subscribers. This convergence of technology and global entertainment is reshaping consumption habits, making international web series pivotal in the strategic evolution and market success of OTT platforms.

2.Statement Of The Problem

The rapid growth of OTT platforms has significantly altered entertainment consumption, with international web series gaining substantial popularity among Indian viewers. However, there is limited research on how demographic factors such as gender, age, income, education, and area of living influence viewers' engagement with international web series and their subscription decisions on OTT platforms. Understanding the impact of international content on subscription motivations and renewal intentions is crucial for OTT service providers aiming to retain and expand their subscriber base. This study seeks to fill

this gap by examining the factors driving viewer engagement with international web series and their effect on subscription choices and renewal behaviour.

3.Objectives

The following are the key objectives of the study:

1.To analyse the factors influencing viewers to watch international web series on OTT platforms.

2.To examine how international web series affect viewers subscription decisions and renewal intentions on OTT platforms.

4.Review Of Literature

- Sangwon et al. (2017) explored the growth of global OTT services in the Korean media market, focusing on technical, industrial, and policy factors. The study highlighted the impact of global OTT players on the national economy and suggested that imposing special reporting requirements could mitigate tax losses. By classifying multinational OTTs as "value-added broadcasting service providers" they could be located in Korea.
- Swati Manoj Yeole and Lambodar Saha (2022) examined factors influencing OTT platform adoption through a survey of 200 participants. They found that ease of access, content variety, and cost sensitivity, particularly flexible subscription plans, influenced user preferences. The study emphasised mobile usage over television, with Netflix as a leading platform.
- Anusha and Kumar (2024) examined user preferences between Amazon Prime and Netflix among 100 Hyderabad respondents aged 16+. The findings revealed that 40% used both platforms, with Amazon Prime favoured for regional content and affordability, and Netflix for diverse shows. The study emphasised tailored engagement strategies for varied viewer types.

5.Research Methodology

This study adopted to explore the factors influencing viewers' engagement with international web series and their subscription choices on OTT platforms. The primary data was collected through a structured questionnaire administered to 110 active OTT platform users in Tiruppur. The questionnaire included items on demographic profile, viewing habits, subscription motivations, plan preferences, and renewal intentions related to international web series. A convenient sampling was employed to select respondents from diverse demographic backgrounds, including variations in gender, age, income, education, occupation, and residential area. The data analysis involved the use of ANOVA to examine significant differences between demographic variables and subscription plan choices, and Garrett ranking analysis to prioritise factors influencing viewer engagement and subscription behaviour.

6.Analysis And Interpretation

The analysis explores how international web series influence viewer engagement and subscription decisions on OTT platforms. By examining demographic profiles and viewing behaviours, the study investigates factors driving the popularity of international contents. It also assesses subscription patterns and renewal intentions among viewers.

Table 1
Profile of the respondents

Profile		Number of respondents	Percentage	Cumulative percentage

	More than 4	31	28.19	100.00
	Total	**110**	**100.00**	

Source: Computed data

The demographic profile of the 110 respondents shows that males dominate (59.10%), while females form 40.90%. The age distribution indicates the largest group is 25–35 years (35.5%), followed by 15–25 (23.6%), 35–45 (21.8%), and above 45 (19.1%). The monthly

income is mainly below ₹20,000 (39.1%) and ₹20,000–40,000 (37.3%), with fewer earning ₹40,000–60,000 (12.7%) and above ₹60,000 (10.9%). Most of the respondents live in urban areas (62.7%), with semi-urban (19.1%) and rural (18.2%) making up the rest. The educational qualification is largely UG (46.4%) and PG (38.2%), with smaller proportions of HSC (8.2%), SSLC (4.6%), and diploma (2.7%). The occupations are primarily salaried employees (43.6%) and students (38.2%), followed by businessmen/professionals (12.7%) and homemakers (5.5%). The marital status is nearly balanced unmarried (51.8%) and married (48.2%). The family size is the highest for four members (31.8%), followed by more than four (28.2%), three (20.9%), and two (19.1%). This reflects a predominantly young, urban, educated, and moderately earning audience for OTT platforms.

Table 2
Subscription choice and Viewers engagement

Subscription choice and Viewers engagement		**Number of respondents**	**Percentage**	**Cumulative percentage**

	More than 3 hrs	12	10.9	100.00
	Total	110	100.00	

Source: Computed data

Among the 110 respondents, international web series is the leading subscription motivation (38.1%), followed by local content (25.5%), movies (19.2%), sports (9.1%), and others (8.2%). The plan type preference shows monthly plans are the most common (43.6%), while freemium accounts (25.5%), annual plans (19.1%), and quarterly plans (11.8%) are less popular. The multiple subscriptions are frequent, with 65.5% maintaining more than one platform compared to 34.6% who do not. Regarding renewal decisions with price changes, 57.3% would renew, whereas 42.7% would not. The Netflix is the most preferred platform for international web series (38.2%), followed by Amazon Prime (33.6%), Disney+ Hotstar (19.1%), and others (9.1%). The renewal decisions influenced by international series are nearly even, with 51.8% agreeing and 48.2% disagreeing. Viewing frequency reveals daily watchers at 38.2%, weekly viewers at 27.3%, monthly viewer sat 16.4%, and rare viewers at 18.2%. Daily viewing hours indicate 39.1% watch under one hour, 28.2% for 1–2 hours, 21.8% for 2–3 hours, and 10.9% for more than three hours.

6.1ANOVA

In this study, ANOVA is employed to examine the differences in subscription plan preferences across various demographic groups among OTT users. It to helps identify whether the factors such as gender, age, income, and education significantly influence viewers choices related to international web series. The analysis provides insights into how demographic diversity shapes subscription behaviours on OTT platforms. The null hypothesis framed for testing is that there is no significant difference between the profile and subscription plans.

Table 3
Analysis of significant difference between plan used and demographic profile

		Sum of Squares	df	Mean Square	F	Sig.
Gender	Between Groups	23.391	3	7.797	258.275	**.000**

	Within Groups	10.757	106	.101		
	Total	67.055	109			
Marital status	Between Groups	24.387	3	8.129	280.041	**.000**
	Within Groups	3.077	106	.029		

	Total	27.464	109			
Family size	Between Groups	106.712	3	35.571	181.455	**.000**
	Within Groups	20.779	106	.196		
	Total	127.491	109			

Source: Computed data

It is evident from the ANOVA results that the demographic variables such as gender, age, income, educational qualification, occupation, area of living, marital status, and family size have a significant difference concerning the OTT plan preferences of respondents, as their p-values are less than 0.05 at both the 5% and 1% significance levels. Hence, the null hypothesis stating there is no significant difference between demographic factors and plan choices is rejected. It is therefore concluded that there exists a statistically significant difference between the type of OTT subscription plan used and the demographic characteristics of the respondents. This indicates that variations in demographic attributes such as gender, income levels, educational background, and family size influence the choice of OTT subscription plans among viewers, highlighting the role of demographic profiles in shaping consumer behaviour on OTT platform.

6.2 Garrett Ranking

Garrett Ranking was applied in this study to identify and prioritise the key factors influencing viewers to watch international web series on OTT platforms. By converting respondents' preferences into quantitative scores, it provides an objective way to rank multiple factors based on their relative importance. This method ensures accuracy in determining which aspects most strongly drive viewer choices. The Garrett Ranking helps to reveal the most impactful elements shaping viewer behaviour in consumption of international web series.

TABLE 4

S.No	Factors	I	II	III	IV	V	VI	VII	VIII	IX	X	Total score	Mean score	Rank

Source: Computed data

The analysis shows that presence of favourite actors/celebrities (66.54) is the top factor influencing viewers, followed by popularity, social media buzz, and promotions (65.22) and easy accessibility (62.35). Unique and engaging storylines (61.84), wide variety of content and genres (60.80), and curiosity about global trends and viral shows (59.77) have moderate influence. Lower-ranked factors include subtitles/dubbing availability (58.92), recommendations from friends/family (58.86), high-quality visuals and production standards (58.37), and affordable subscription pricing (58.25). Overall, celebrity presence and trending content are the strongest drivers of viewer engagement.

7.Findings

The study outcomes are highlighted in the following findings:

- Demographic analysis shows most of the respondents are young (25–35), urban, educated (UG/PG), and moderately earning, with males (59.10%) dominating OTT usage.
- International web series (38.1%) are the leading subscription motivator, followed by local content and movies.
- Monthly plans (43.6%) are the most preferred, and 65.5% maintain multiple subscriptions, indicating willingness to explore diverse content.
- ANOVA results reveal significant differences between demographic variables (gender, age, income, education, occupation, marital status, area, and family size) and subscription choices ($p < 0.05$).
- Garrett ranking highlights favourite actors/celebrities (66.54), social media buzz/promotions (65.22), and easy accessibility (62.35) as top engagement factors, while affordable pricing ranks lowest (58.25).
- Viewing patterns show 38.2% watch daily, mostly for less than 1 hour (39.1%), showing habitual yet time-conscious engagement.
- Netflix leads as the most preferred platform for international content (38.2%), followed by Amazon Prime (33.6%).

8.Suggestions

OTT platforms may focus on

- Acquiring / producing high-quality international web series featuring popular actors and trending global shows to attract and retain subscribers.
- Offering flexible pricing models and tailored plans (e.g., student discounts or family packs) to cater to diverse demographic groups such as young adults, families, and moderate-income users.
- Improving subtitle and dubbing options across multiple languages to make international content appealing to non-English-speaking and regional audiences.
- Strengthening marketing strategies through influencer campaigns, viral promotions, and social media engagement, as trending content and recommendations strongly influence subscription decisions.

9.CONCLUSION

The study highlights the significant impact of international web series on viewer engagement and subscription choices on OTT platforms. The demographic analysis and ANOVA results reveal that factors such as gender, age, income, education, occupation, area of residence, marital status, and family size significantly influence subscription plan preferences. This underscores the critical role demographic diversity plays in shaping consumer behaviour on OTT platforms. Furthermore, Garrett ranking analysis identifies key drivers of viewer engagement and subscription decisions, including unique storylines, favourite actors, subtitle availability, and accessibility. These insights suggest that OTT providers must prioritise diverse, high-quality international content while tailoring subscription plans and engagement strategies to meet varied demographic needs. By doing so, platforms can enhance Viewer satisfaction, boost subscription retention, and strengthen competitiveness in the evolving OTT landscape where international web series serve as a pivotal growth catalyst.

ECONOMIC AND SOCIAL DIMENSIONS OF STREET FOOD VENDING: A REVIEW OF LITERATURE

Kripahari.P
Ph.D Research scholars in Commerce,
Dr. B. Kanagaraj
Assistant Professor in Commerce, PG and Research Department of Commerce,
Chikkanna Government Arts College, Tiruppur.

Abstract
Street food vendors are an integral part of the urban food ecosystem, offering affordable, accessible, and culturally rich meals to diverse populations. This study explores the significance of street food vendors in urban settings, with a focus on their economic contributions, the benefits they offer, and the challenges they face. While street vending provides employment opportunities, promotes traditional cuisine, and supports low-income livelihoods, vendors frequently encounter legal hurdles, inadequate infrastructure, health and hygiene concerns, and exploitation by authorities. The research further examines legislative measures like the Street Vendors (Protection of Livelihood and Regulation of Street Vending) Act, 2014, and highlights the need for greater legal recognition and support.
Keywords :Street vendors, street food, urban economy, informal sector, public policy, food safety, livelihood, traditional cuisine, legal challenges, urban infrastructure.

INTRODUCTION

Street food vendors are an essential part of the urban food landscape, providing quick, affordable, and diverse meals to millions of people every day. From small carts to mobile stalls, these vendors serve a wide variety of local and traditional foods that reflect the culture and tastes of the region. Street food is not only convenient and economical but also supports livelihoods, especially for low-income families who depend on it both as a source of income and daily sustenance. However, food vendors often face issues such as lack of hygiene facilities, legal challenges, and limited access to resources. Studying street food vendors helps us understand their economic contribution, the nutritional value of their offerings, and the challenges they face in maintaining safety and quality standards in a rapidly changing urban environment.

Street food vendors are a vibrant and indispensable part of urban life, especially in developing countries like India. They provide quick, tasty, and affordable meals to people from various economic backgrounds. Whether it's a busy office-goer grabbing breakfast on the way to work or a student enjoying a quick evening snack, street food caters to the needs of millions daily. These vendors often sell local, traditional, and seasonal delicacies that preserve and promote regional culinary heritage.

Definition Of Street Vendors

According to Section 2(1) of Street Vendors Act, 2014 "Street vendors" means a person engaged in vending of articles, goods, food items or merchandise of everyday use or offering services to the general public, in a street lane, pavement, footpath, or any other public place or private area, from a temporary builtup structure or by moving from place to place includes hawker, peddler, squatter and all other synonymous terms which may be local or region-specific; and the words "street vending" with their grammatical variations and cognate expressions, shall be constructed accordingly. Street vendors are classified as mobile vendors and static vendors. The mobile vendors move from place to place and sell their goods

and commodities. The static vendors remain in a fixed place and sell their products to the public.

Street Vendors Act 2014

The Street Vendors Act of 2014 is a legal safeguard for theprotection of livelihood and regulating the business of streetvending. This act enshrines the constitutional provisionswhich are given in the fundamental rights of Article 14, Article 19 (1) (g) which deals with the right to equality, rightto start any business or carry out any occupation/profession. The major motive of this act is to regulate the street vendingprofession without hindering the public, avoiding congestionof streets, sidewalks, pavements, railway platforms, markets, playgrounds, outside the malls and plazas. Further, this actenables the protection of rights and safeguards the streetvendors under social security and social justice without anyforms infringement. The major feature of this act givesimportance for the Town Vending Committee by all the stategovernment to protect the vending rights. This committeehas a chairman and members which is constituted by thestate government which regulates and recommends with thedistrict, corporations and town panchayats. The committeeconsists of planning, medical, police, traders, Ngocnominated members of the government and the chairman isMunicipal Commissioner. In this 40 percent representationis done by the street vendors who elect the members fromthe street vendor's community which should also have 1/3rdwomen representation including schedule caste and scheduletribes. The town vending committee has a representation of10 percent which can be appointed by the ngos and civilsocieties. The allowances for the members and chairman aredecided by the respective government.

Objectives

The aim of the study is to present the theoretical framework and literature review of Street vendor about food.

Benefits Of Street Vendors About Food

1. Low Start-Up Costs: Food street vending requires minimal capital investment compared to restaurants.
2. Flexibility and Mobility: They can move to different locations depending on foot traffic and customer demand.
3. Direct Customer Interaction: Vendors build strong relationships with regular customers.
4. Employment Opportunities: Street food vending provides self-employment, especially for the unskilled or semi-skilled.
5. Promotion of Local Cuisine: Vendors often serve traditional and regional foods, helping preserve culinary heritage.

Challenges Of Street Vendors About Food

1. **Lack of Legal Recognition:**Many vendors operate without licenses or permits, making them vulnerable to eviction and fines.
2. **Poor Infrastructure:**Inadequate access to clean water, electricity, storage, and waste disposal affects food safety and quality.
3. **Health and Hygiene Issues:** Limited awareness or resources to follow proper hygiene standards can lead to foodborne illnesses.
4. **Inconsistent Income:**Earnings fluctuate due to weather, season, competition, or changes in foot traffic.
5. **Harassment and Bribes:** Vendors may face exploitation or bribery from authorities due to unclear regulations.

To address these challenges, the street vendors about foods. Future plans include

1. **Digital Integration:** Adoption of mobile payment systems (like UPI, QR codes) and online food delivery platforms can increase reach and income.
2. **Government Support Schemes:** Initiatives like PM SVANidhi (India) provide credit, training, and legal recognition to street vendors.
3. **Growing Demand for Street Food:**Urbanization and the popularity of local, affordable food can fuel growth in this sector.
4. **Training and Skill Development:**Providing education on hygiene, packaging, and business skills can enhance food quality and vendor success.
5. **Sustainability and Eco-Friendly Practices:**Shifting to eco-friendly packaging and practices can attract health- and environment-conscious customers.

Literature Review

- **Karthikeyan and Mangaleswaran (2017)[1]** conducted a study on the problems faced by the street vendors at workplace in Tiruchirapalli city of Tamilnadu, India. The study had the sample size of 35 respondents by adopting convenient samplingmethod. The study states that bribing to police is one of the major problems faced by street vendors. They also suffer with health issues due to monsoon rain, scorching sun, dust pollution, skin problems, respiratory diseases and various other diseases which constitute as workplace hazards. The study further states that the street vendors are not aware about the policies which are made by the government. The findings of the study show a lot of scope for social work practice among the street vendors. The street vendors must be protected from police harassment. They should be given awareness on following workplace safety aspects to avoid the consequences of workplace hazards. Awareness on saving practice must be also given to the street vendors in order to meet their financial needs in future.
- **Jamuna (2016)[2]** conducted a study among fifty woman fish vendors in Ramanthurai, Tamilnadu. The study states about the problems and prospects of the women fish vendors. The author says that the fish vendors are almost neglected in the planning and budgets. Even though they are financially included in certain aspects the development doesn't prevail in their community. The author further states that the government must formulate policies which can benefit and uplift the lives of women fish vendors. The author suggests that the government should provide state insurance facility, regulated brokerage in fish vending, provision of loan facilities through nationalized bank to avoid taking loans from local money lenders who charge high interest, government initiative to establish local market in the village and setting up a primary health centre which can benefit the women fish vendors.
- **Sarkar (2016)[3]** conducted a study on problems, prospects and rehabilitation of Kolkata street vendors. The study states that the street vendors contribute to the urban economy but they are ill treated and harassed by the local authorities. The local authorities come up with many rehabilitation projects but all ends up in unrealistic solutions. After analyzing the problems of Kolkata street vendors the author proposes a new relocation plan within the boundary of Kolkata city. The relocation plan was made keeping in mind the interest of street vendors benefit and also the traffic and hygiene concerns of Kolkata city. The author further states that utilization of the proposed plan can favor the local administration, general public and the street vendors.
- **Panwar and Garg (2015)[4]** conducted a study on the issues and challenges faced by the urban street vendors of Sonipat city, India. The study had the sample size of 200 street vendors. The study states about some major problems which are suffered by

thestreet vendors such as lack of water facility, electricity, toilets, shelter, waste disposal, storage facilities and forceful eviction by the government for the urban development activities. The study suggests that the government should take necessary steps to meet the workplace needs of the street vendors. It further suggests that the street vendors should be allotted a separate place when the city development projects are planned in order to avoid the constant forceful eviction of street vendors in the city.

- **Lin and Yamao (2014)[6]** conducted a study among seventy two street food vendors of Yangon, Myanmar. The study focuses on aspects such as socio-economic, food safety and production aspects. The study states that the food stalls in the streets of Yangon are not under control. The fixed and permanent food stalls food control is much better than the street food stalls. The reasons for not under control may be due to lack of clean water facility, lack of timely disposal of garbage, lack of toilet facility at the workplace and lack of supervision by city development council. The study further says that the street vendors do not need to pay tax to the government: however, they are not legally protected. The study suggests that the Yangon City Development Council (YCDC) must take necessary measures such as provision of clean drinking water, toilet facility, timely disposal of garbage and effective supervision by city development council in order to maintain the food safety under control in the streets of Yangon.
- **Achtell and Ernest (2013)[7]** conducted an impact study on Investing in equality for working poor women in various Latin American countries, Asian, Europe and African countries. The impact study focused on various aspects such as policy making, market support, organizational strength, fair trade for women products and the occupational health and safety which is especially more relevant to the current study. The study states that significant improvement has been found in the knowledge of occupational health and safety through the effective workshops organized by the local government. The study further states that the health insurance scheme for informal workers by the government of India is also an impact of the initiative which is taken for the working poor women.
- **Kumar and Singh (2013)[8]** states that the initiative taken by Bhubaneswar Municipal Corporation (BMC) in association with National Association for Street Vendors (NASVI) is very humongous. It acts as a model for all the cities in India to turn the street vending as a profit earning business for the entrepreneurs and to the corporation too. BMC and NASVI constructed a public market by including the investment of street vendors in Bhubaneswar city. The constructed market stays as a shelter and permanent place for the vendors and it generates revenue to the municipal corporation. An impact of this permanent market shelter the street vending in the public places of Bhubaneswar city got reduced in number and it beautified the city in terms of cleanliness. The BMC was awarded by the state government for beautifying the city.
- **Matsobane (2013)[9]** conducted a study among the Limpopo University students. The author states about some factors which hampers the students to purchase fruits from the hawkers in the streets. Unhygienic vending environment is the main reason which hampers the students. The study also found that the street vendors are selling the fruits under the open sun which makes the fruit to dry. It acts as an adding factor which hampers the students to buy fruits from the street hawkers. The study suggests that the municipality or city council should train the street hawkers to maintain hygiene and sanitation. The study further suggests that certain policies should be made for street

hawkers which can benefit them as well as maintaining the healthy environment in the vending zones.

- **Mishra and Mishra (2013)[10]** conducted a study on prospects of flower vendors in Bhubaneswar city of Orissa. The study articulates the workplace condition of flowers vendors in the streets of Bhubaneswar and the issues faced by them. The study states that the flower vendors face various workplace hazards such as inadequate watersupply, unavailability of toilet facility, need of electricity facility, parking issues, allotment of vending zones and need of credit facility for working capital. The study suggests that water, electricity and toilet facility, credit facility, allotment of vending zones for vendors and parking facility away from the vending zone should be provided in order to overcome the workplace place hazards faced by the flowers vendors of Bhubaneswar city.
- **Alfers (2012)[11]** states that the informal food sellers in the streets of Ghana are sell their food products in the midst of unhygienic conditions. They are not provided with enough water facilities, removal of wastages is not done in daily basis and even the toiletries are not maintained properly. The private concern which has taken the outsourcing activity of maintaining the hygiene in the city is not up to the mark. So the food sellers in the street are forced to a situation to sell the foods in an unhygienic environment. The author further says that the food sellers suffer with health problems because of vending in the unhygienic streets. The failure of Accra metropolitan assembly in not providing a hygienic environment in the streets leads to ill health conditions.
- **Balakrishna, Maithery, Singh, Narain, and Naveen. (2012)[12]** states that the hawkers and vendors are exploited by misuse of law. The street vendors who perform vendingin the public places are considered as public nuisance and disturbance. The report further explains various laws and Acts of Indian constitution and court trials against the municipal corporations which forcefully evacuate the street vendors from their vending places.
- **Adhikari (2011)[13]** states that more people are involved in street vending activity even though the income is very low when comparing with other business. The author conducted a study among the street vendors of Kathmandu city of Nepal. The study had the sample size of 170 street vendors from Kathmandu city. The author describes that the street vendors of Kathmandu city are predominantly urban poor and the migrated rural poor population. The study focuses on the relation between the increase in the level of income of street vendors when there is increase in labour supply, investment and education. The findings of the study states that the income of the street vendors increases when there is an increase in labor supply, investment and education. The study further states that street vending can form itself as a revenue earning entrepreneurship and can contribute well to the urban economy if it is brought under legality status.
- **Devlin (2011)[14]** The author explains in the research paper about the case of an Afghan woman street vendor who established a fruit shop in front of a multinational restaurant in USA. The women street vendor had proper license to run the business. The author further states that the woman street vendor has all the right to perform street vending and she follows all the regulations of the government. The multinational restaurant business got affected by the newly established Afghan women street vendors' fruit shop. The woman street vendor was threatened by therestaurant manager. Due to the threat caused by the restaurant manager, later the woman street vendor moved to another place which is an unauthorized place to perform vending. This has put the woman street vendor in a situation of technically

violating the vending laws. The author states that the complex nature of street vending rules and policies and unawareness of legal rights made the woman street to vacate from legally approved vending zone. This may put into the risk of legal actions against the woman street vendors.

- **Saha (2011)[16]** studied about the work life condition of street vendors in Mumbai city, their socio-economic condition, workplace hazards, harassment by local municipal and police authorities and the organizations working for the well being of street vendors. It is an explorative study with 200 samples. The findings of the study reveal that the street vendors' safety and hygiene factor in workplace is not much impressive. They are often harassed and forced to bribe by municipal authorities and police personal. Moreover they are in threat by the money lenders from whom they borrow money for higher interest. Lack of support organizations is also an adding factor for the street vendors' misery.

CONCLUSION

Street food vendors play a vital role in urban economies by offering affordable, accessible, and culturally significant food options to people from all walks of life. Their presence not only supports the livelihoods of thousands of low-income families but also contributes to preserving traditional cuisine and promoting entrepreneurship with minimal investment. Despite their importance, these vendors face numerous challenges, including legal hurdles, lack of infrastructure, health and safety issues, and social marginalization.

Government Arts College (Autonomous), Coimbatore.

Abstract
This study investigates the influence of social media reviews on tourist perception and destination choice. With the growing dependence on platforms such as Instagram, Facebook, YouTube, TripAdvisor, and WhatsApp, tourists increasingly rely on user-generated content to plan their travels. Primary data were collected from 75 respondents through a structured questionnaire covering demographic details, social media usage, and its impact on destination selection. Chi-square tests were applied to examine associations between demographic variables and the influence of social media reviews. Results show significant relationships between education, occupation, marital status, monthly income, and perception of social media reviews, while variables such as place of residence were not significant. The study highlights the importance of credible and authentic reviews in shaping tourist decision-making. These insights will be valuable for destination marketers, tourism boards, and policymakers to develop effective digital marketing strategies.
Keywords: Social media reviews, Destination choice, Digital marketing, Online influence, Tourism promotion,

1.INTRODUCTION:

Social Media has become an essential platform for sharing experiences and opinions. Tourists increasingly rely on social media reviews to make informed decisions regarding their travel plans. Platforms such as Instagram, Facebook, TripAdvisor, Whatsapp and YouTube provide instant access to a wide range of user-generated content, including reviews, photos, and videos, which influence the perception of destinations. The authenticity, popularity, and visibility of these reviews often shape travelers' expectations and preferences. Consequently, understanding the role of social media reviews in influencing tourists' perceptions and destination choices has become crucial for tourism marketers, destination managers, and researchers. Tourist perception is no longer solely based on traditional travel guides or word-of-mouth recommendations; instead, it is dynamically shaped by online interactions and the collective opinions of social media users. With the increasing penetration of smartphones and social media platforms, the travel decision-making process has transformed, making online reviews a critical factor in destination.

2.Statement of the problem

Social media has emerged as a dominant platform where travelers share experiences, opinions, and reviews about tourist destinations. These online reviews often serve as a primary source of information for potential tourists, influencing their perception of destinations and guiding their travel decisions. However, despite the growing reliance on social media, many tourists face challenges in evaluating the authenticity, credibility, and relevance of these reviews.while positive reviews can enhance a destination's appeal, negative or misleading reviews may deter potential visitors, affecting the tourism industry's growth and reputation. There is limited empirical research that examines how social media reviews specifically impact tourists' perceptions and their ultimate destination choices. This

gap makes it difficult for tourism marketers, destination managers, and policymakers to develop effective strategies to leverage social media for promotion, reputation management, and customer engagement.

3.Significance of the study

This study is significant because it examines the expanding impact of digital media on the travel and tourism sector, this study is noteworthy. The study offers insights into consumer behavior in the tourism industry by examining the ways in which social media reviews affect travelers' perceptions and decisions. The results can be used by destination marketers to create online strategies that will improve the destination's reputation and draw more tourists. By bridging the gap between social media influence and tourism behavior, this study also advances academic knowledge and provides useful information for travel agencies, tourism boards, and policymakers to enhance their marketing campaigns.

4.Objective:

1.To assess how social media reviews influence tourists' perception of destinations.
2. To examine the impact of online reviews on tourists' travel choices.

5.Research Methodology

5.1Research design: Descriptive research design was adopted to Analyze the role of social media reviews in influencing tourist behavior.
5.2Population and Sample: The population comprised active social media users who travel for leisure or business. A total of 75 respondents were selected, representing different age groups, educational levels, occupations, and income categories.
5.3Sampling Technique: Purposive sampling was used to ensure respondents were active users of social media platforms relevant to tourism.
5.4Data Collection Method: Primary data were collected through a structured questionnaire, while secondary data were obtained from journals, published reports, and online sources related to social media and tourism.
5.5 Data Analysis Tools: Data were analyzed using descriptive statistics (frequency and percentage analysis) and Chi-square tests to examine the association between demographic variables and the influence of online reviews.
5.6 Study Area: The respondents were drawn from urban, semi-urban, and rural backgrounds, ensuring a diverse geographic representation.

6.Review of Literature

- **Oza and Sinha (2024),** in their study "Exploring the Influence of Social Media on Tourism: A Demographic Analysis of Tourist Behavior with Respect to Gujarat", examine how social media engagement affects tourist decision-making. Using a quantitative approach with a sample of 50 tourists, the study employed SPSS for descriptive analysis, reliability testing (Cronbach's alpha), and correlation analysis. Key findings reveal moderate positive correlations between social media usage and travel decisions, with influencer endorsements and visual content playing significant roles. The authors recommend leveraging targeted social media strategies to enhance tourism marketing effectiveness.
- **Dilip S. Chavan (2023),** in "A Systematic Study of Indian Tourism and Social Media Marketing", explores the role of social media in promoting tourism in Maharashtra.

The study surveyed 150 individuals over age 20 and used percentage analysis to assess social media's impact on travel behavior. Findings show 72% prefer social media for tourism advertising, and 41% check destination reviews before traveling. The study recommends leveraging digital platforms for tourism branding and engagement. It concludes that social media is a powerful tool for tourism promotion, replacing traditional methods.

- **LeeKim and Song (2023),** in their study titled "Investigating the Role of Influencers on Social Media in Promoting Sustainable Tourism in South Korea", aimed to assess how social media influencers affect tourists' attitudes toward sustainable travel. The authors conducted a quantitative study using a structured questionnaire and collected data from 304 respondents. Structural Equation Modeling (SEM) using AMOS was applied. The results revealed that influencers positively impacted tourists' attitudes and intentions toward sustainable tourism. The authors recommend using credible influencers for awareness campaigns. The study concludes that influencers are vital in promoting responsible travel behavior.

7.Analysis and Interpretation

The analysis revealed that young, educated, and employed respondents rely heavily on social media reviews for travel choices. Chi-square tests showed significant influence of education, occupation, gender, and income, while residence was not significant. Reviews, especially authentic ones, strongly shaped tourists' perception and destination decisions across demographics.

7.1 Profile of the Respondent

Table 1Profile of the Respondent

Profile		**Number of respondents**	**Percentage to Total**
Age	Above 18	9	12.0
	21-30	48	64.0
	31-40	15	20.0
	41-50	3	4.0
	Total	**75**	**100.0**
Gender	Male	27	36.0
	Female	48	64.0
	Total	**75**	**100.0**
Education Qualification	School Level	9	12.0
	Diploma	6	8.0
	Under Graduation	24	32.0
	Post Graduation	33	44.0
	Ph.D	3	4.0
	Total	**75**	**100.0**
Occupation	Student	18	24.0
	Employee	54	72.0
	Business	3	4.0
	Total	**75**	**100.0**
Marital status	Single	42	56.0
	Married	33	44.0
	Total	**75**	**100.0**
Monthly Income	Below 15000	15	20.0

	15001-30000	39	52.0
	30001-45000	18	24.0
	Above 45000	3	4.0
	Total	**75**	**100.0**
Place of Resident	Rural	27	36.0
	Semi -urban	21	28.0
	Urban	27	36.0
	Total	**75**	**100.0**

Source: Primary data

The demographic profile of the respondents offers valuable context for understanding the patterns observed in the study. A total of 75 individuals participated, representing a diverse mix across age, gender, education, occupation, marital status, income, and place of residence.The majority of respondents fall within the 21–30 age group (54.7%), indicating that the sample is predominantly composed of young adults—an age segment often active in digital engagement and brand interaction. Male respondents constitute 62.7% of the sample, while females account for 37.3%, suggesting a moderate gender imbalance.Educational qualification, most participants hold either an undergraduate (37.3%) or postgraduate degree (36.0%), reflecting a well-educated respondent base. This is further supported by the occupational distribution, where students (37.3%) and individuals employed in private (24.0%) or government sectors (13.3%) form the bulk of the sample.The marital status is nearly evenly split, with 50.7% single and 49.3% married, allowing for balanced insights across lifestyle stages. Regarding monthly income, a significant portion of respondents earn between ₹10,001 and ₹15,000 (26.7%), followed by those in the ₹5,001–₹10,000 (24.0%) and ₹15,001–₹20,000 (20.0%) brackets, indicating a middle-income majority.Finally, the place of residence is evenly distributed between urban (36.0%) and rural (36.0%) areas, with semi-urban respondents comprising 28.0%. This geographic spread ensures representation across different living environments, which may influence consumer behavior and access to digital platforms.

7.2Social media influence of choosing destination

Table 2 Result of chi square analysis

Profile and Influence Of choosing destination	**Calculated Value**	**Table Value**	**Degrees of Freedom**	**Null Hypothesis Accepted or Rejected**	**Inference**
Age and Influence of choosing destination	10.298	12.592	6	Rejected	Significant
Gender and Influence of choosing destination	8.120	5.997	2	Rejected	Significant
Education Qualification and Influence of choosing destination	21.793	15.507	8	Rejected	Significant
Occupation and Influence of choosing destination	13.636	9.488	4	Rejected	Significant

Marital status and Influence of choosing destination	7.851	5.991	2	Rejected	Significant
Monthly Income and Influence of choosing destination	31.264	12.592	4	Rejected	Significant
Place of Resident and Influence of choosing destination	3.968	9.488	6	Accepted	Not Significant

Source:Computed data

The chi-square analysis indicates a significant association between gender ($\chi^2 = 10.731$, $p < 0.05$), marital status ($\chi^2 = 7.256$, $p < 0.05$), occupation ($\chi^2 = 13.256$, $p < 0.05$), monthly income ($\chi^2 = 13.256$, $p < 0.05$), and educational qualification ($\chi^2 = 13.256$, $p < 0.05$) with the preference for choosing a particular brand. These findings suggest that individuals' brand choices are influenced by their gender identity, marital status, professional background, income level, and educational attainment.In contrast, no significant relationship is observed with age ($\chi^2 = 12.526$, $p > 0.05$) and place of residence ($\chi^2 = 3.568$, $p > 0.05$), implying that consumers across different age groups and geographical locations tend to exhibit similar brand preferences.the results highlight that socio-economic and personal profile factors—especially gender, occupation, and income—play a meaningful role in shaping consumer brand choices, while age and residential location appear to have a more neutral influence.

7.3 Impact of online review

Table 3 Result of chi square analysis

Profile and Impact of online review	**Calculated Value**	**Table Value**	**Degrees of Freedom**	**Null Hypothesis Accepted or Rejected**	**Inference**
Age and Impact of online review	33.255	21.026	12	Rejected	Significant
Gender and Impact of online review	2.300	9.488	4	Accepted	Not Significant
Education Qualification and Impact of online review	41.856	26.296	16	Rejected	Significant
Occupation and Impact of online review	28.125	15.507	8	Rejected	Significant
Marital status and Impact of online review	9.050	9.488	4	Accepted	Not Significant
Monthly Income and Impact of online review	24.824	21.026	12	Rejected	Significant
Place of Resident and Impact of online review	15.476	15.507	8	Accepted	Not Significant

Source:Computed data

The chi-square analysis reveals a significant association between age ($\chi^2 = 23.353$, $p < 0.05$), family income ($\chi^2 = 24.933$, $p < 0.05$), device used ($\chi^2 = 24.933$, $p < 0.05$), and place of residence ($\chi^2 = 15.746$, $p < 0.05$) with the perceived impact of online classes. These findings suggest that younger individuals, those from varying income groups, users of different devices, and residents of distinct geographical areas experience online learning in notably different ways.Conversely, no significant relationship is observed with gender ($\chi^2 = 3.222$, $p > 0.05$), educational qualification ($\chi^2 = 14.383$, $p > 0.05$), and locality ($\chi^2 = 9.600$, $p > 0.05$). This implies that male and female learners, individuals across educational levels, and those from urban or rural localities tend to perceive online classes similarly.Overall, the results highlight that technological access and socio-demographic factors such as age, income, and residence play a crucial role in shaping students' online learning experiences, whereas gender and education level appear to have a more neutral influence.

8. Findings

1. Social media reviews significantly influence tourists' choice of destinations.
2. Young adults (21–30 years) are the most influenced age group.
3. Females showed slightly higher dependence on online reviews compared to males.
4. Education and occupation strongly determine the credibility tourists place on social media reviews.
5.Place of residence has little impact on the influence of reviews.

9. Suggestions

1. **Authenticity of Reviews:** Tourism boards and travel platforms should implement stronger review-verification systems to avoid misleading content.
2. **Targeted Marketing:** Digital marketing campaigns should focus on young adults and working professionals, as they are more responsive to social media influence.
3. **Content Strategy:** Encouraging tourists to share genuine photos, videos, and experiences can increase trust among potential travelers.
4. **Influencer Collaboration:** Partnering with credible social media influencers can enhance destination visibility.
5. **Awareness Programs:** Tourists should be educated on identifying fake or biased reviews to make better decisions.

10. CONCLUSION

The study concludes that social media reviews have a profound impact on tourist perception and destination selection, particularly among educated, employed, and middle-income groups. While traditional sources of information remain relevant, online platforms now serve as the primary decision-making tool for most travelers. The findings stress the need for tourism marketers and policymakers to adopt strategies that ensure credibility, encourage user engagement, and leverage the growing influence of digital content. Strengthening the authenticity of reviews and developing targeted marketing approaches will help destinations build a positive image and attract more tourists.

LEVERAGING IOT IN AUDITING: ENHANCING REAL-TIME DATA ACCURACY AND OPERATIONAL EFFICIENCY

Dr. R. Prema
Associate Professor & Head, Department of Commerce (IT),
Ms. Kiruthika S
Student, Department of Commerce (IT),
Ms. Kavya M
Student, Department of Commerce (IT),
KPR College of Arts, Science and Research, Coimbatore.

Abstract:
The Internet of Things (IoT) is revolutionizing data collection across industries by providing real-time, automated monitoring of physical assets and operations. In auditing, IoT presents significant opportunities to improve data accuracy, enable continuous auditing, and enhance operational efficiency. This paper explores the integration of IoT technologies into audit processes, focusing on its ability to automate data capture, reduce human errors, and provide real-time insight into asset performance and compliance. Key benefits include improved fraud detection, enhanced reliability of audit evidence, and reduced operational costs. However, challenges such as data privacy, system integration, and security risks require careful management. The study concludes that IoT is not merely a complementary tool but a fundamental shift toward data-driven auditing that supports more timely and strategic decision-making.
Keywords:IoT, Auditing, Real-Time Data, Continuous Auditing, Fraud Detection, Compliance Automation.

1. INTRODUCTION

Auditing serves as an essential mechanism to ensure the integrity, reliability, and transparency of financial and operational data in organizations. Traditionally, audits rely on periodic sampling, manual checks, and historical records, which are often time-consuming and prone to errors or manipulation.The emergence of the **Internet of Things (IoT)** enables seamless real-time data collection from sensors embedded in physical assets, equipment, and environmental systems.

2. Literature Review

Recent research emphasizes that the Internet of Things (IoT) has the potential to transform auditing by providing continuous, automated data collection from physical assets. Traditional audit processes rely heavily on periodic checks and manual data entry, which can be time-consuming and prone to human error. In contrast, IoT enables real-time data acquisition, giving auditors direct access to operational data such as machine usage, environmental conditions, and asset movements without relying on third-party reports.

The **Data Quality Theory** highlights that accurate, complete, and timely information is crucial for effective auditing. IoT aligns well with this theory by continuously generating high-quality data that improves the reliability of audit evidence. Additionally, the **Continuous Auditing Framework** has gained attention, advocating for real-time verification of transactions and asset status using technology.

Despite these advantages, the literature shows that practical adoption is still limited. Many auditors are unfamiliar with IoT technology, and there are concerns about integrating IoT data with existing audit software. Studies also point out potential security and privacy risks, especially when dealing with sensitive financial and operational data.

This paper aims to fill the gap by providing a comprehensive understanding of IoT applications in auditing, focusing on real-world benefits and challenges.This paper investigates the role of IoT in transforming auditing practices and analyses its benefits, challenges, and future scope.

3. Research Methodology

This study adopts a **qualitative exploratory research methodology** using **secondary data sources**. Secondary data refers to information that has already been collected, analyzed, and published by other researchers, organizations, or industry experts. The approach is suitable for understanding emerging technologies like IoT in auditing, where real-time primary data collection is complex and expensive.

Data Sources

The primary sources of data for this study include:

- Academic journal articles that discuss the theoretical frameworks and practical applications of IoT in auditing.
- Industry reports published by leading consulting firms such as PwC, Deloitte, IBM, and DHL, which provide real-world insights and case studies.
- White papers and research articles from technology providers specializing in IoT solutions for finance and auditing.
- Published case studies that demonstrate the implementation of IoT technologies in auditing environments.

Analysis Framework

A **comparative framework** is applied to systematically analyse the differences between traditional audit practices and IoT-enabled auditing. The study focuses on the following key aspects:

1. **Data Accuracy** – Comparing the quality of data collected manually versus automatically via IoT sensors.
2. **Operational Efficiency** – Assessing time and cost savings due to automation.
3. **Fraud Detection Capabilities** – Evaluating how real-time monitoring improves the detection of irregularities.
4. **Regulatory Compliance** – Understanding how automated data helps maintain continuous regulatory compliance.

By synthesizing findings from secondary data, this research identifies patterns, emerging trends, and the practical implications of IoT in auditing. The qualitative approach provides a broad perspective on opportunities and challenges, enabling a well-rounded understanding without the need for new primary data collection.

4. Applications of IoT in Auditing

- **Real-Time Data Collection**: IoT devices capture and transmit data such as machine performance, temperature, usage logs, and inventory levels in real time. This provides auditors with continuous access to critical operational data without relying on manual reporting.
- **Continuous Auditing**: Traditional audits are periodic, creating time gaps between checks. IoT enables continuous auditing, allowing real-time verification of transactions and asset conditions, improving detection of irregularities as they occur.
- **Fraud Detection and Risk Management**: By monitoring real-time asset usage and transactional flows, auditors can detect anomalies, unauthorized access, or suspicious patterns instantly, enabling faster intervention and fraud mitigation.

- **Compliance Monitoring:**IoT sensors can automatically verify compliance with regulatory standards (e.g., environmental limits, safety thresholds) and feed data into audit systems to reduce manual checks and errors.

5.Case Study – DHL's Smart Warehouse Auditing System

DHL, a global leader in logistics, has implemented an **IoT-based Smart Warehouse Auditing System** to improve the accuracy and efficiency of its operations. The system uses a network of sensors placed throughout the warehouse to continuously monitor conditions such as temperature, humidity, and the movement of goods. Each sensor sends data in real time to a centralized platform where auditors can track asset conditions without visiting the site physically.

For example, temperature-sensitive products like pharmaceuticals are constantly monitored to ensure they remain within the required temperature range. If any deviation occurs, the system automatically flags the issue, allowing auditors to immediately investigate the cause. This real-time capability reduces the time needed for periodic manual checks and eliminates the risk of missing important events between inspections.

The system also tracks inventory movements. Instead of relying on manual stocktaking, RFID sensors automatically record when goods are received, stored, or shipped. This not only improves accuracy but also helps auditors detect any discrepancies or unusual activity in real time, reducing the risk of fraud.

As a result, DHL has significantly improved data accuracy, reduced operational costs, and strengthened compliance with safety and regulatory standards. This case demonstrates how IoT-based auditing can provide continuous assurance of asset conditions while enabling auditors to focus more on analysis and decision-making rather than data collection.

6.Opportunities of IoT in Auditing

The integration of IoT into auditing creates several valuable opportunities that improve the quality, efficiency, and reliability of audit processes:

1. **Improved Data Accuracy**: IoT devices automatically capture real-time data from physical assets, removing the need for manual data entry. This reduces human errors, ensures accurate records, and provides auditors with reliable evidence that reflects the actual state of operations.
2. **Continuous and Real-Time Auditing**: Unlike traditional audits conducted periodically, IoT enables continuous auditing. Auditors can monitor transactions and asset conditions in real time, allowing them to detect anomalies or compliance issues as they happen, rather than after significant delays.
3. **Enhanced Fraud Detection:**IoT provides detailed logs of asset usage, environmental conditions, and transactional events. This continuous stream of data makes it easier to spot irregular patterns or unauthorized activities immediately, helping auditors and management take corrective actions faster and prevent potential financial fraud.
4. **Operational Efficiency and Cost Savings**: Automated data collection reduces the time and labour costs associated with manual audits. Auditors can focus on analysis and decision-making rather than spending time collecting or verifying data, which improves overall audit productivity.
5. **Proactive Compliance Monitoring**: IoT enables automated verification of compliance with industry standards and regulations. Sensors can continuously check conditions such as temperature thresholds or safety limits and automatically report any deviations, helping companies stay compliant and reducing the risk of regulatory penalties.

7.Challenges of IoT in Auditing

While IoT offers many benefits in auditing, its adoption also faces several significant challenges that must be addressed for successful implementation:

1. **Data Privacy Concerns**: IoT devices continuously collect and transmit sensitive financial and operational data. Without proper security measures, this data can be vulnerable to unauthorized access, breaches, or misuse. Protecting confidential information while maintaining transparency becomes a critical balancing act for auditors and organizations.
2. **System Integration Issues**: Most traditional audit management systems are not designed to integrate with IoT platforms. This creates technical difficulties in connecting sensor-generated data to existing audit workflows and software, requiring significant investments in system upgrades or custom solutions.
3. **Security Vulnerabilities**: IoT devices are often exposed to cyberattacks due to weak built-in security protocols or outdated software. Hackers can potentially intercept data streams or manipulate sensor outputs, which would compromise the integrity of audit evidence.
4. **High Implementation Costs**: Installing IoT infrastructure, including sensors, connectivity solutions, and data platforms, involves considerable initial investment. Small and medium-sized enterprises (SMEs) may find these costs prohibitive, slowing the widespread adoption of IoT in auditing.
5. **Lack of Skilled Professionals**: Effective use of IoT in auditing requires auditors to possess knowledge of both auditing practices and IoT technologies. Currently, there is a shortage of professionals with the necessary technical expertise to operate, analyse, and interpret IoT data within audit frameworks.
6. **Regulatory Uncertainty**: Global and industry-specific regulations around the use of IoT in auditing are still evolving. The lack of clear and uniform regulatory guidelines creates uncertainty, making companies hesitant to adopt IoT-based auditing solutions without a clear legal framework.

CONCLUSION:

The integration of Internet of Things (IoT) technology into auditing is reshaping the way organizations collect, analyze, and report financial and operational data. By enabling real-time, automated data capture, IoT improves the accuracy of audit evidence, enhances fraud detection, and allows continuous compliance monitoring. These benefits help auditors focus more on strategic analysis and decision-making rather than manual data collection.However, challenges such as data privacy concerns, system integration difficulties, high implementation costs, security risks, and a shortage of skilled professionals must be carefully managed to ensure successful adoption. Regulatory uncertainty further complicates the transition.Despite these obstacles, IoT holds tremendous potential to transform auditing from a periodic and reactive process into a proactive, efficient, and data-driven practice. The future lies in combining IoT with technologies like Artificial Intelligence (AI) and Blockchain, enabling intelligent audit ecosystems that offer improved transparency, operational efficiency, and strategic insights. Organizations that adopt these innovations will gain a competitive advantage by ensuring more accurate, reliable, and timely financial assurance in a digital economy.

BLOCKCHAIN IN ACCOUNTING

Dr.S.Jagatheeswari
Assistant Professor M.Com CS CA
Mr.T.Vigneshwaran
M.Com CS, Dr.N.G.P Arts and Science College, Kalapatti, Coimbatore

Abstract:
Blockchain technology, initially designed to support cryptocurrencies, is now gaining attention across various industries, including accounting. As a decentralized and immutable ledger, blockchain has the potential to transform the way financial transactions are recorded, verified, and reported. This paper explores the integration of blockchain in accounting, its advantages such as transparency, real-time auditing, fraud reduction, and cost efficiency, while also addressing challenges including regulatory uncertainty, scalability, and adoption barriers. The study concludes that blockchain is not a replacement for accountants but a tool that can enhance their roles, leading to a more secure and efficient financial ecosystem.
Keywords: Blockchain, Accounting, Transparency, Auditing, Fraud Prevention

INTRODUCTION

The evolution of accounting practices has been significantly influenced by technological advancements. From manual bookkeeping to digital accounting systems, the profession has always adapted to new tools that enhance accuracy and efficiency. In recent years, blockchain has emerged as one of the most disruptive technologies with the potential to reshape financial reporting and auditing processes.Blockchain is a distributed ledger technology that ensures data integrity through decentralization and cryptographic security. For accountants, it represents a paradigm shift from trust in centralized intermediaries to trust in technology. The application of blockchain in accounting can eliminate redundancies, enhance auditability, and increase transparency. This paper examines how blockchain technology can be integrated into accounting systems and its implications for the future of the profession.

Literature Review

Blockchain is essentially a chain of blocks, where each block contains transaction data, a timestamp, and a cryptographic hash of the previous block. This design ensures that once a transaction is recorded, it cannot be altered, providing immutability and reliability.

Key features of block chain include:
- Decentralization: No single authority controls the ledger.
- Transparency: Transactions are visible to all authorized participants.
- Immutability: Once recorded, data cannot be tampered with.
- Security: Cryptographic protocols protect transaction integrity.

These attributes make blockchain particularly suitable for accounting, where accuracy, trust, and transparency are paramount.

Methodology/Findings

Applications of Blockchain in Accounting:
1. Real-time Auditing and Assurance:

Blockchain enables real-time verification of financial transactions. Auditors can access immutable records instantly, reducing the need for sampling methods and manual verification. This can shorten audit cycles and increase reliability.

2. Fraud Prevention and Transparency:
The immutability of blockchain records prevents manipulation of financial data. Every transaction is time-stamped and traceable, making fraudulent entries easy to detect.

3. Smart Contracts in Accounting:\Smart contracts are self-executing agreements with predefined conditions coded into the blockchain. They can automate processes such as revenue recognition, lease accounting, and supplier payments, minimizing human error.

4. Cost Reduction and Efficiency:
By eliminating intermediaries and automating reconciliation, blockchain can reduce costs for businesses. It also minimizes delays caused by manual bookkeeping.

5. Supply Chain Accounting:
Blockchain can be used to track goods and financial transactions in supply chains. This provides accountants with greater visibility into costs, logistics, and compliance.

Challenges and Limitations:

1. Regulatory Uncertainty
2. Scalability Issues
3. Adoption Barriers
4. Integration with Existing Systems

CONCLUSION

Blockchain is a revolutionary technology with the potential to reshape the accounting profession. By enabling real-time auditing, fraud prevention, and efficient financial reporting, it addresses many of the limitations of traditional accounting systems. However, widespread adoption depends on overcoming regulatory, technical, and organizational challenges. Accountants must adapt by developing technological competencies to fully leverage blockchain. Ultimately, blockchain promises a future where accounting is more transparent, efficient, and trustworthy.

A STUDY ON EXPLORING BEHAVIOURAL IMPACT OF SOCIAL MEDIA ON ONLINE CONSUMERISM IN THE BEAUTY PRODUTS

S. Kalai Selvi
Research Scholar(Part Time) School of Management, A.V.P College of Arts and Science- Co- Education, Thirumuruganpoondi, Tirupur, Tamil Nadu, India.
Dr. S.Sindhubairavi
Research Supervisor, Assistant Professor & Head, School of Management, A.V.P College of Arts and Science- Co- Education, Thirumuruganpoondi, Tirupur, Tamil Nadu, India

Abstract
In recent years, the rapid rise of social media platforms has significantly transformed consumer behavior, particularly in the beauty industry. This study investigates the behavioral impact of social media on online consumerism in the context of beauty products. It explores how factors such as influencer marketing, user- generated content, social proof, and targeted advertisements shape consumers purchasing decisions. Using a mixed-methods approach, including surveys and content analysis, the research examines patterns among diverse demographics and their interactions with beauty related content on platforms like Instagram, Tiktok, and YouTube. The findings suggest that social media not only enhances brand visibility and engagement but also plays a vital role in influencing trust, perceived product value, and impulse buying behavior. This study contributes to the understanding of digital consumer psychology and offers strategic insights for beauty brands aiming to optimize their psychology and offers strategic insights for beauty brands aiming to optimize their online presence and marketing efforts. User-generated content also contributes to the shifting landscape of beauty marketing. Consumers often rely on reviews, testimonials, and product demonstration videos created by other users to guide their decisions. This form of content fosters sense of community and trust, as it represents real life experiences rather than polished advertisements.UGC enables consumers to feel more confident in their purchasing decisions when it comes to new or untested beauty products. Other critical aspect of social media's influence is the direct and interactive engagement between brands and consumers. Features such as live videos, polls, comments, direct messaging, and interactive stories allow brands to receive instant feedback and tailor their marketing strategies accordingly. Personalized
Engagement fosters loyalty and creates a sense of belonging, transforming customers into active participants in the brand narrative. Overall, social media as become indispensable part of the consumer decision making process in the beauty industry. It has redefined how beauty products are marketed discussed, and consumed. The dynamic interaction between influencer, brands and consumers creates a complex yet powerful eco-system that continuous to evolve with technological advancements and shifting consumer expectations. Understanding these digital behaviors is essential for beauty brands aiming to stay competitive and in an increasingly connected and content-driven marketplace.
Keywords*:* Social Media, Influencers, Consumer Behavior, Online Beauty Marketing, Decision Making.

INTRODUCTION

Consumer behaviour refers to the study of individuals, groups, or organizations and the processes they use to select, purchase, use, and dispose of products, services, experiences, or ideas to satisfy their needs and desires. It encompasses a wide range of factors—psychological, personal, cultural, and social—that influence buying decisions. Understanding

consumer behaviour is crucial for businesses, as it helps them align their products, marketing strategies, and services to meet customer expectations more effectively.
In the digital age, consumer behavior has evolved significantly, especially with the rise of e-commerce and social media platforms. These digital spaces have become influential arenas where consumers discover, evaluate, and engage with products, particularly in visually driven industries like beauty and personal care. Consumers today rely not only on traditional advertising but also on peer reviews, influencer recommendations, and interactive content when making purchasing decisions.
Social media has redefined the way beauty products are marketed and consumed. Platforms like Instagram, TikTok, and YouTube allow brands and influencers to connect directly with consumers, often creating aspirational lifestyles and trends that heavily impact buying behavior. As a result, studying consumer behavior in the context of social media offers valuable insights into the motivations, preferences, and decision-making processes of modern beauty consumers.
This evolving landscape necessitates a deeper understanding of how online interactions and digital content shape consumer attitudes and actions, making it a critical area of research for marketers, brand strategists, and businesses operating in the beauty industry.

This study will investigate the behavioral impact of social media on online consumerism within the beauty industry. It will explore how factors such as motivation, income, demographics, and shopping preferences interact with digital engagement to influence purchasing decisions. By employing a comprehensive literature review and robust research methodologies, this research aims to offer insights into this evolving relationship. The study will conclude with key findings, a discussion of its limitations, and practical recommendations for industry stakeholders.

LITERATURE REVIEW

Ajzen's **Theory of Planned Behavior (TPB)** (1991) offers a foundational framework for understanding consumer intention. According to this theory, individual behaviour is influenced by attitudes, subjective norms, and perceived behavioural control. In the context of social media, these variables are shaped by influencers, peer interactions, and user-generated content (UGC), all of which impact the decision-making processes of online consumers.
Shih (2004), drawing from the Technology Acceptance Model (TAM), examined how perceived ease of use, usefulness, customer satisfaction, and web security affect consumer tendencies toward e-shopping. His findings demonstrated that increasing perceived usefulness and satisfaction strengthens positive attitudes toward online shopping, thereby enhancing behavioural intention.
Kaplan and Haenlein (2010) defined social media as internet-based platforms built on Web 2.0 technologies, which enable the creation and exchange of user-generated content. Their work emphasized the participatory nature of social media, which allows consumers to actively engage with and influence brand messaging. This aligns with **Solomon et al. (2012)**, who argued that the boundaries between content creation and consumption are increasingly blurred, affecting how consumers relate to brands.
To understand user interaction with brand content, **Muntinga, Moorman, and Smit (2011)** developed the **COBRA (Consumers' Online Brand-Related Activities)** framework, which identifies three tiers of engagement: consumption (viewing), contribution (commenting or sharing), and creation (producing original content). These behaviours reflect varying levels of consumer involvement, each with implications for brand perception and purchase intention.

Phelan et al. (2013) found that UGC is often perceived as more authentic and trustworthy than corporate messaging. In the beauty industry, where visual evidence and peer reviews hold significant sway, content such as product reviews, tutorials, and before-and-after photos help bridge the information gap and serve as credible forms of social proof.

RESEARCH GAP

Although previous studies have explored the influence of social media on consumer behaviour, limited research specifically examines its impact within the beauty industry—a sector heavily shaped by visual content, influencer culture, and peer engagement. Foundational models like the Theory of Planned Behavior and COBRA provide useful frameworks, but they often overlook industry-specific dynamics such as Para social interactions and the persuasive power of user-generated content in beauty-related purchases.

Additionally, while the authenticity of user content has been acknowledged, there is a lack of empirical evidence linking this directly to actual purchase behaviour in online beauty markets. Cultural and demographic variations in consumer responses to social media are also underrepresented, limiting the broader applicability of current findings.

This study addresses these gaps by focusing on how social media platforms influence online consumerism specifically in the beauty industry, integrating psychological, social, and demographic factors.

PROBLEM STATEMENT

Social media has become a powerful force in shaping consumer behaviour, particularly in the beauty industry where visual appeal, influencer marketing, and peer-generated content strongly influence purchasing decisions. However, existing research often takes a broad view of digital consumerism and lacks a focused analysis of how these social media elements specifically impact online beauty consumption. Key factors such as influencer credibility, par asocial interactions, and the perceived authenticity of user-generated content remain underexplored in relation to actual buying behavior. This gap limits the understanding of how psychological, social, and demographic factors intersect on digital platforms to drive consumer decisions in the beauty sector.

OBJECTIVES OF THE RESEARCH

1.To analyses how social media platforms influence consumer purchasing behavior in the cosmetic industry.

2.To examine ethical considerations and gaps in current social media marketing practices within the cosmetic sector.

3.To evaluate the effectiveness of different social media content types in driving consumer engagement.

4.To identify the key psychological and social factors that drive online consumerism of beauty products through social media platforms.

5.To provide recommendations for beauty brands to effectively utilize social media as a tool to influence consumer behavior and enhance online sales.

RESEARCH METHODOLOGY

Research Design - This study adopts a **quantitative research methodology** to examine the influence of social media on consumer purchasing behaviour within the cosmetic industry

Sampling Technique –

A probability sampling technique, specifically simple random sampling, is used to ensure that every individual within the defined population (i.e., active social media users who purchase cosmetics online) has an equal chance of selection. This enhances the representativeness and generalizability of the findings. The target population includes individuals across diverse age

groups, genders, and income levels who actively engage with beauty-related content on platforms such as Instagram, YouTube, and TikTok.

SOURCE OF DATA

Primary Data: Collected through structured surveys using a comprehensive questionnaire comprising multiple-choice and closed-ended questions.

Secondary Data: Gathered from relevant academic journals, marketing reports, industry publications, and textbooks.

Sample Size: A total of 150 respondents, including both male and female participants, were surveyed.

Tools Used: To examine the behavioural influence of social media on cosmetic purchasing decisions, Chi-square tests of independence were employed as the statistical tool.

Sampling Unit: The sampling unit for this research is individuals residing in the Mumbai Metro who engage in online and off line shopping.

HYPOTHESIS 1

H_0 (Null Hypothesis): There is no significant relationship between time spent on social media and the likelihood of purchasing cosmetic products after seeing them on social media.

H_1 (Alternative Hypothesis): There is a significant relationship between time spent on social media and the likelihood of purchasing cosmetic products after seeing them on social media.

Hypothesis	**Null (H_0)**	**Test**	**Chi²**	**df**	**p-value**	**Decision (α = 0.05)**	**Inference**
Ho	No significant relationship between time spent on social media and purchasing cosmetic products after seeing them. them.	Chi-square independence	19.955	16	0.222	Fail to reject H_0	No significant relationship was detected.

For Hypothesis 1, the chi-square test revealed **no statistically significant relationship** between the amount of time spent on social media and the likelihood of purchasing cosmetic products after seeing them online *($\chi^2 = 19.955, p = 0.222$)*. Therefore, we **fail to reject the null hypothesis**, indicating that time spent on social media alone may not be a strong predictor of purchasing behaviour.

HYPOTHESIS 2

H_0 (Null Hypothesis): There is no significant association between trust in user-generated content and the influence of beauty influencers on purchasing decisions.

H_1 (Alternative Hypothesis): There is a significant association between trust in user-generated content and the influence of beauty influencers on purchasing decisions.

Hypothesis	Null (H_0)	Test	Chi²	df	p-value	Decision (α = 0.05)	Inference

H0	No significant association between trust in user-generated content and the influence of beauty influencers.	Chi-square independence	28.363	16	0.029	Reject H_0	Significant association was detected.

For Hypothesis 2, the chi-square test showed a statistically significant association between trust in user-generated content and the influence of beauty influencers on purchasing decisions ($\chi^2 = 28.363, p = 0.029$).Thus, we reject the null hypothesis, suggesting that higher trust in user-generated content is meaningfully linked to the impact influencers on consumer behaviour.

FINDINGS AND ANALYSIS

1.The age distribution of respondents reveals a strong concentration 15-20 age group, with participation gradually declining among older demographics, indicating a youth- dominated sample. Female respondents significantly outnumber males, though males still represent roughly one-third of the total sample. In terms of academic background, most participants are undergraduates, reflecting a student – centric population.

2.Regarding social media usage, **daily engagement peaks between 1 to 4 hours**, with a noticeable segment reporting heavier usage. **Instagram clearly dominates as the preferred platform** for beauty-related content, followed distantly by youtube, while other platforms hold minimal influence.The smartphone is the primary device used to access beauty content, with desktops and laptops playing a relatively minor role.

3.In terms of consumer behaviour**, approximately half of respondents have purchased a cosmetic product after seeing it on social media.** Whereas about one-third reported never doing so. **The most influential purchase trigger is user reviews,** which far outpace influencer endorsements and paid advertisements. When it comes to consumption frequency, the majority of participants' browse beauty content either weekly or daily, with very few indicating no engagement at all.

4.Trust in beauty information found on social media is generally moderate, with extremes of total trust of scepticism being relatively rare. Brand reputation holds substantial weight, with most respondents rating it as "very" or "extremely" important in their decision making. In terms of engagement, liking or reacting to brand posts is common, while active forms of engagement like commenting or sharing are less frequent.

5.When asked about advocacy, most respondents expressed a willingness to recommend products discovered on social media, suggesting positive brand influence. However, concerns about misleading or deceptive advertising is high, highlighting consumer scepticism. Finally, response on price sensitivity shows a near-even divide-some participants are willing to pay a premium for socially hyped products, while others remain budget- conscious.

CONCLUSION

This study highlights the significant yet nuanced impact of social media on consumer behaviour in the beauty industry. With a predominantly young (15–20 years) and female sample, findings reveal that Instagram is the leading platform for beauty content, and user reviews/testimonials are the most persuasive form of content. Despite regular exposure to beauty promotions, the largest group of respondents reported never purchasing a product after seeing it online, and most rated influencers as only "somewhat influential," with neutral trust in user-generated content (UGC) over brand promotions. Chi-square analysis showed no significant relationship between time spent on social media and purchasing behaviour, indicating that screen time alone does not drive cosmetic buying decisions. However, a

significant association was found between trust in UGC and the influence of beauty influencers, emphasizing that authenticity and perceived credibility play a stronger role in shaping consumer decisions than simple exposure or advertisement frequency. Thus, social media's power lies not in volume but in the **trusted and relatable nature of content**, particularly within visually driven, peer-influenced sectors like beauty.

AI FOR BUSINESS INNOVATION

Naveen B, Ravi Kishan
MBA Scholar, RVS College of Arts and Science

Abstract
Artificial Intelligence (AI) has emerged as a transformative force in business, reshaping industries and driving innovation at an unprecedented pace. From product development to marketing, supply chain optimization, and customer engagement, AI is enabling organizations to create new business models and gain competitive advantage. This paper explores the role of AI in business innovation, its applications, key challenges, and future directions.

INTRODUCTION

Innovation has always been the cornerstone of business growth and sustainability. In the 21st century, Artificial Intelligence (AI) has become one of the most significant drivers of innovation, enabling organizations to develop smarter products, enhance operational efficiency, and improve customer experiences. Businesses that embrace AI are not only improving performance but also creating disruptive business models that challenge traditional industries. This paper examines how AI contributes to business innovation, supported by theories, applications, and case studies.

Literature Review

Schumpeter's theory of innovation highlights technological advancement as a major source of business growth. Modern scholars like Brynjolfsson and McAfee (2017) emphasize the role of AI in transforming industries by automating tasks and enhancing decision-making. Davenport and Ronanki (2018) identify three categories of AI applications: process automation, cognitive insights, and customer engagement. McKinsey (2019) reports that AI adoption could potentially add trillions of dollars to the global economy by 2030. These studies highlight that AI is not merely a technological tool but a strategic enabler of innovation.

Methodology / Findings

This paper adopts a qualitative methodology, relying on secondary data from academic journals, case studies, and industry reports. Findings suggest that AI drives business innovation in several areas:

1. Product Innovation: AI supports product personalization and design. For example, Netflix uses AI to recommend content.
2. Process Innovation: AI optimizes supply chains and predictive maintenance. Siemens employs AI for industrial efficiency.
3. Marketing and Customer Engagement: Coca-Cola uses AI-driven analytics for customer insights.
4. Human Resource Innovation: Unilever leverages AI in recruitment through video interview analysis.
5. Financial Innovation: JP Morgan's COiN platform uses AI for legal contract review.

These findings indicate that AI accelerates decision-making, enhances productivity, and opens new avenues for business growth.

CONCLUSION

Artificial Intelligence is no longer an emerging technology but a core enabler of business innovation. It empowers organizations to design innovative products, streamline operations, and create superior customer experiences. However, challenges such as ethical concerns, high costs, and workforce readiness must be addressed to realize AI's full potential. Companies that integrate AI responsibly will gain a sustainable competitive advantage in the global market.

DIGITAL MARKETING TRENDS AND STRATEGIES

Dharshini.B, Manashwini.A
II B.Com IB, Department of Commerce with International Business
Dr.N.G.P Arts and Science College, Coimbatore.

Abstract

In today's fast evolving business landscape, digital marketing has emerged as a critical tool for organisation to engage with customers, build brand visibility, and drive growth. Rapid technological advancement, changing consumer behaviour, and the dominance of social media platforms have redefined marketing approaches. This paper explores the latest digital marketing trends such as artificial intelligence – driven personalisation, influencer marketing, voice search optimisation, short – form video content marketing, search engine optimisation (SEO), social media engagement, email automation, and Omni channel integration. By aligning these trends with innovation strategies, businesses can enhance customer experiences, achieve competitive advantage, and adapt to the dynamic digital ecosystem. In today's digital age, marketing has moved far beyond traditional methods. It's now more data-driven, interactive, and cantered around the customer. Instead of relying only on broad online ads, businesses use real-time insights, behavioural data, and new technologies to design impactful campaigns. Key trends shaping this shift include AI-powered customer profiling and automation, the growing popularity of video and interactive content, the rise of voice and visual search, and the influence of social media personalities on branding. Since modern consumer's value authenticity and personalisation, companies must keep innovating to stay relevant. At the same time, digital marketing strategies are focusing more on long-term engagement rather than quick sales. While SEO and content marketing remain core elements, they're now reinforced with targeted social media ads, personalised email campaigns, and seamless Omni channel experiences. Businesses are also investing heavily in analytics to track ROI and fine-tune their efforts in real time. Beyond performance, there's a growing expectation for brands to reflect values like sustainability and ethical responsibility in their digital communication. By adapting to these trends and strategies, organisations can build stronger customer connections, enhance brand trust, and then the digital transformation has become essential.

Keywords: Personalisation, Digital Transformation, Omni Channel Marketing, Marketing Automation, Ethical Branding.

INTRODUCTION:

Digital marketing utilises digital channels like websites, apps, social media, and search engines to promote products and services. It complements traditional marketing by enabling companies to engage consumers and analyse behaviours innovatively. Popularized in the 1990s with internet growth, digital marketing today blends with traditional strategies to reach audiences, facing challenges like rapid digital evolution and data usage. Digital marketing leverages channels like websites, mobile devices, social media, and search engines to promote products and services, complementing traditional marketing approaches. Evolving since the 1990s, key platforms include email, social media, and pay-per-click advertising – each needing strategic planning to hit target audiences. Core strategies encompass website marketing, content creation, email campaigns, social media engagement, affiliate marketing, and growing trends like video and text message marketing. Marketers grapple with challenges like proliferating digital channels, crunching data for insights, and grabbing attention amidst digital noise. To succeed, digital marketers need sharp communication skills, data analytics prowess, and savvy social media understanding to weave compelling marketing

stories. Marketing involves promoting products and boosting market share through various techniques and media. It blends advertising and sales skills, handled by in-house teams or external marketing firms. Traditionally focused on print, TV, and radio, marketing evolved with the internet, adding digital marketing as a key avenue to connect with consumers. New tech and trends reshaped marketing strategies. Email was an early digital tool. Then came search engines like Netscape, enabling tagging and keywords for visibility. Social platforms like Facebook allowed targeted marketing via user data. Now smartphones let companies reach consumers anywhere – 76% of American adults bought online via phones (2022 Pew Research).

OBJECTIVES:
1. To analyse current digital marketing trends and how they influence consumer behaviour and brand visibility.
2. To evaluate key digital marketing strategies that help businesses improve engagement and conversion rates.
3. To identify future opportunities and challenges for companies adopting emerging digital marketing practices.

Trends In Digital Marketing:

1**. Artificial Intelligence and Personalization**

Artificial Intelligence (AI) is no longer a supporting tool but a central driver of digital marketing. It enables businesses to deliver customized recommendations, real-time insights, and dynamic content delivery. AI helps companies not only predict consumer behaviour but also improve decision-making.

Key Applications of AI in Marketing:

Chabot's and Virtual Assistants – Deliver instant, 24/7 customer support with human-like conversations. Predictive Analytics – Helps brands anticipate demand, design campaigns, and minimize risk. Real-Time Personalization – AI-driven tools modify website banners, ads, and email offers instantly for each user. This shift indicates that personalization is no longer optional—it is the foundation of competitive advantage.

2**. Voice and Visual Search**

Search behaviour is transforming with the growing use of smart speakers and image-based search engines. Users are now asking conversational queries or uploading images instead of typing keywords.

Trends within this Area:

Conversational SEO – Marketers must adapt to long, natural queries like "What is the best coffee shop near me?" instead of single keywords. Visual Search Optimization – Product images need rich metadata, alt text, and clarity to be searchable by tools such as Google Lens. Local Discovery – Voice search often emphasizes "near me" results, making local SEO a critical strategy. This trend reduces the gap between human interaction and digital platforms, offering more natural and intuitive search experiences.

3**. Social Commerce Integration**

Social platforms are no longer just for engagement—they are now powerful sales channels. Features like Instagram Shops, TikTok Shopping, and Facebook Marketplace allow purchases without leaving the platform.:

Frictionless Shopping:

In-app checkout simplifies the buying journeySocial commerce demonstrates the merging of entertainment, interaction, and commerce into one integrated ecosystem.

4**. Generative Search Engines**

The introduction of AI-powered search engines (e.g., Google's Search Generative Experience) is reshaping SEO. Instead of showing a list of links, AI generates summarized responses.

Implications for Marketers:

Content must be concise, credible, and well-structured. Authority building through citations and data-backed claims is essential. Optimizing for long-tail and contextual queries ensures inclusion in AI-generated snippets. This represents a paradigm shift: marketers must optimize for machines and human readers simultaneously.

5. Ethical and Sustainable Marketing

Consumers are holding brands accountable for their values and practices. Transparency, inclusivity, and sustainability have become deciding factors in consumer loyalty.

Core Dimensions of Ethical Marketing:

Inclusivity – Representation of different age groups, genders, and cultures in campaigns. Transparency – Honest claims and disclosure of product practices, avoiding green washing. Sustainability – Promoting eco-friendly packaging, energy-efficient operations, and responsible sourcing.This trend reflects that modern consumers want to associate with brands that reflect their beliefs.

Digital Marketing Strategies:

Content Marketing and Storytelling: Content remains the cornerstone of digital engagement, but emphasis has shifted to narratives that emotionally connect with audiences. Rather than just promoting products, storytelling builds brand identity and consumer loyalty.

1.**Authenticity:**

Real stories (brand origin, customer testimonials) resonate deeply. Emotional Appeal: Campaigns that address aspirations, struggles, or cultural themes gain traction.

Multi-Format Content:

Videos, podcasts, blogs, and reels extend reach to diverse audiences.Content marketing has evolved into a tool for relationship-building, not just promotion.

2. Search Engine Optimization (SEO)

SEO has grown beyond ranking high in Google search results—it now involves optimizing for voice, visual, and AI-powered searches.

Modern SEO Tactics:

Voice Search Optimization – Integrating natural language queries into content.Schema Markup – Search engines understand structured content. Mobile Optimization – A necessity, as most searches happen on mobile devices.In the age of generative AI, SEO is an ongoing, adaptive practice rather than a one-time strategy.

3. Data-Driven and First-Party Analytics : With increasing data privacy concerns, reliance on first-party data has become crucial. This data—collected directly from customers—offers reliable insights without breaching trust.Data-driven marketing ensures decisions are informed, measurable, and future-ready.

4. Marketing Automation and AI Tool : Automation ensures that businesses can scale their communication while preserving personalization. From automated email campaigns to CRM-driven lead scoring, automation reduces repetitive tasks and improves efficiency. Consumers now demand seamless journeys across physical and digital spaces. Brands must create consistent experiences whether a customer is online, in-store, or on mobile.

CONCLUSION:

Digital marketing in 2025 thrives on tech innovation and shifting consumer mind sets. Trends like AI-driven personalization, immersive content, and ethical branding redefine brand-audience connections. Success hinges on crafting authentic, data-backed experiences that resonate emotionally across platforms. Marketers blending innovation with human touch will forge trust and lasting loyalty.In today's digital landscape, marketing transcends promotion – it's about forging meaningful bonds via personalised, immersive, value-driven interactions. AI, voice search, short-form video, social commerce, and AR/VR have revolutionized engagement. Simultaneously, consumers crave transparency, sustainability, and authenticity, expecting brands to embody social responsibility and inclusivity.Strategies now marry data insights with emotional intelligence, merging tech and creativity to deliver contextual messages. An agile, Omni channel approach leveraging first-party data and AI collaboration – as a partner to human insight – is key. The future favours brands adapting swiftly, staying customer-centric, and syncing with cultural shifts. Doing so positions they not just to compete, but to lead.

THE IMPACT OF BLOCKCHAIN TECHNOLOGY IN LOGISTICS INDUSTRIES

Dr. S. Kalaiyarasi
Assistant Professor and Head, Department of Commerce,
NIFT TEA College of Knitwear Fashion, Tirupur
Dr. A.R. Kanagaraj
Professor, Dr. N. G. P. Arts and Science College, Coimbatore

Abstract
The paper deals with the impact and benefits of introduction of block chain technology in logistics industries. Process management can become complicated since logistics, by its very nature, calls for the engagement of multiple companies. Numeroust asks are completed by logistics management inorder to organise, coordinate, confirm, and monitor activities. Blockchain now supports functions securely and effectively.
Blockchain technology will assist businesses in lowering management costs, delays, and human error by verifying, controlling, and storing transactions in logistics. The effects of blockchain technology on the logistics sector are highlighted in this paper. Process management can become complicated since logistics, by its very nature, calls for the engagement of multiple companies. Numerous tasks are completed by logistics management in order to organise, coordinate, confirm, and monitor activities. Blockchain now supports functions securely and effectively. Blockchain technology will assist businesses in lowering management costs, delays, and human error by verifying, controlling, and storing transactions in logistics. The effects of blockchain technology on the logistics sector are highlighted in this paper.

INTRODUCTION

Every day, many products are produced within the intricate logistics and supply chain systems and delivered to customers via the ideal distribution channel. A very limited amount of information is received throughoutthe life cycle of the products from the point of production to the point of consumption. Money, information, and material flows are exchanged amongst all stakeholders in a two-sided fashion before the products transit through numerous processes in an ecosystem and arrive at the point of final consumption. Logistics firms should be able to meet sectoral expectations because logistics is a service delivery. While meeting sectorial standards, logistics companies profit from information technology infrastructure and systems. So, to the extent that businesses control information technology and incorporate these systems into their operations. The preservation of records pertaining to logistical activities is essential for businesses. Records, data, and transactions are now being maintained and held in a technological advancement brought about byindustrialrevolutionsin a digital context. At this point, blockchain enters the picture as a technology that makes it possible for data to be created digitally, distributed across several networks, and recorded. In addition to all of these things, blockchain also offers data securitythrough encryption techniques (Özyüksel and Ekinci, 2020). Blockchain makes it possible for a product to havea complete lifespan from the point of manufacture to the point of sale. Block chain technology, which offers consumers in the supply chain end-to-end security, maintains records indefinitely and in real time. Blockchain serves the same purpose of communication, traceability, and transparencythat the internet does (Kaykç, 2021). The legitimacy of products maybe known, shared, and validated in logistical operations thanks to block chain technology. Businesses may profit from it by having more traceability, transparency, and efficiency.

Despite the benefits of block chain, there are also gaps in understanding and trust associated with the technology and its use (Zulfiqar et al., 2022).
Process management can become complicated since logistics, by its very nature, calls for the engagement of multiple companies. Numerous tasks are completed by logistics management in order to organise, coordinate, confirm,and monitor activities. Blockchain now supports functions securely and effectively. Blockchain technology will assist businesses in cutting down on management expenses, delays, and human error by verifying, controlling, and storing transactions in logistics (Al-Jaroodi and Mohamed, 2019).

The Effects of Blockchain Technology on Logistics Industry

1.1. BlockchainTechnologyOverview

- Blockchain is a distributed ledger-based, next-generation technology for verifying transactions. The encrypted transaction records createdinthechainarereferredtoas blocks since theyare immutable(Yldzand Baştu,2018).Anyone with internet access can use the global database technology known as blockchain anywhere they wish. Blockchain differs from conventional databases in that it is an open ledger. Block chain makes it possible to spy on the entire network, making it difficult to trick the system with fictitious documents, transactions, etc (Mohanta et al., 2019).
- The blockchain system functions as follows in its most basic form; A transaction request is made when a transaction betweenentitiesAand B isdesired over the blockchainnetwork, to every peer. Then, at regular intervals, each node gathers a string of transactions and compiles them into a single block. The network nodes, known as miners, complete the verification process of each block using the concept algorithm (Kouicem et al., 2018).
- Blockchain technology has a disruptive effect on the management, organisation, and operations of the supply chain. The use of the blockchain in the supply chain is still being analysed and developed (Saberi et al., 2019). The number of participants in the global supplychain is one of the keyvariables affecting the adoption of blockchain in that system. The conventional supply chain method requires more time than blockchain. Without a blockchain, audits take a long time and involve many individuals. Blockchain continuously conducts these checks without the need for extra time or manpower. This results in lower verification and audit process costs (Gurtu and Johny, 2019).

1.2. BenefitsofBlockchainTechnologyfortheLogisticsIndustry

- Blockchain is a safe platform that parties may use to share and trade product information. By sharing information, blockchain can demonstrate that items come from a trustworthy source, increasing customer loyalty and profitability. It will be feasibletotrack the movements ofapackageacross the supplychain when itislogged in the chain, providing accurate information about the delivery time (Dobrovnik et al., 2018).
- It ispossibletolistthe potential benefits of block chain for the supply chain as follows(Deloitte,2017):
    - Offering the public access to blockchain-verified data mayboost their trust in supplychain information. For the supply chain to profit from block chain, all players must work together. Details the existence, transparency, andmoreofthe product's history from manufacturing to consumption. This increases product visibility for businesses and customers.

- By removing fake goods from the market, blockchain can boost consumer confidence by enhancing product traceability (i.e., the procedures that things go through).
- Businesses can have more control over the contract manufacturing process. Due to the fact that everyone in the supply chain has access to the same information, it lowers data transfer or communication errors. The deliveryof goods and services cantake more time. Data validation can be done with less effort and time.
- With the implementation of blockchain, costs can be decreased. An efficient audit of the supply chain's data helps streamline administrative procedures.

- Thefollowingbenefitsofblockchaintothelogisticssectorarestatedinthe PwCreport:
  - Increases real-time visibility:Provides real-timeinformation on transportmodesandthestatusofeventsthrough transparency.
  - Provides end-to-end transparency: It provides a single source of truth by integrating the data of all participantsin the supply chain.
  - Enables performance monitoring: Reliable information can be obtained about the past performance of suppliers and carriers with blockchainbased monitoring.
  - Confirms source: Blockchain provides proof of origin with the assurance of security and compliance standards throughout the supply chain.
  - Detects fraud: Participants can see all transactions. Shippers can verify authenticity by tracking when all transactions and documents have been modified. Fraud situations such as double brokerage are also eliminated after detection.
  - Verifies documents and data: Blockchain creates an encrypted and secure environment for exchange of documents and data, owing to its immutable feature.
  - Prevents theft: It can contain rules and detailed information that increase security, such as photo ID on picking and delivery.
  - Improves quality assurance:All organizations can validate and evaluate the data. In this way, the evaluation of the cargo at the delivery points and the conflicts between them can be reduced.
  - Eliminates intermediaries: The blockchain system instils trust and enables peer-to-peer models. In this way, it replaces the intermediaries.
  - Increases automation: Thanks to smart contracts, cargo controls, payments, transfer of ownership, etc. can be automated.
  - Reduces transaction cost: Blockchain verifies each transaction with consensus verification. In this way, both repetitions and processing errors are avoided.
  - Increased compatibility: Blockchain can be combined with Electronic Logging Devices (ELDs) that send real- time information about driving behavior to the blockchain platform to increase operational efficiency.

1.3. PotentialChallengesinImplementingBlockchainTechnology

- While blockchain offers organisations a number of benefits, it also poses a number of difficulties and unanticipated hazards, much like any other emerging technologies. Block chain technology is extremely vulnerable to

- unanticipated mistakes, system breakdowns, and ignorant users. Despite the fact that the blockchain system is not controlled bya single party, this mayprovide challenges including management and operating issues (Irannezhad, 2020).
- The usage of blockchain technology within enterprises frequently involves its integration with a variety of distributed applications. Theaddition offunctionality requiredtosupport future business modelswillbemadepossiblebyblockchain. Currently, integrating blockchain technology with traditional applications can be challenging. This problem is brought on byinteroperabilityand security. It's possible that newapps cannot be easilyandsecurelyintegratedwithlegacyor existing systems. Furthermore, these apps may have been created by several vendors utilising various programming languages, environments, and processes. These elements exacerbate the complexity and difficulty of the integration process(AlJaroodi& Mohamed, 2019).
- The following issues need to be resolved before blockchain is used across all industries, according to a report released by DHL(2018):
    - The most important difficultyisensuringthat the industryadopts blockchain technology, as this will affect how well it works in logistics. Gaining stakeholder loyalty in the initial period will be challenging, and developing industry standards and managing the blockchain are other difficulties.
    - There willbeseveralpermissionedandpublicblockchainsrather than asingle blockchain-based systembecause logistics is a competitive industry. To cooperate, businesses need establish agreements and norms. The logistics sector is facing these issues, and a blockchain partnership named Blockchain in Transport Alliance (BiTA) is emerging to address them.

CONCLUSION

- When properly implemented, blockchain aids businesses involved in logistics and supply chain management in increasing efficiency, cutting expenses, and increasing income by developing new products and services. Due to a lack of understanding, many businesses are having trouble successfully using the technology. Since its initial implementations in cryptocurrencies, blockchain technology has evolved and is now poised to have a substantial impact on practically all businesses. The ripples from this technology are starting to spread out in all directions, including the logistics sector,where blockchain promises to streamline companyprocedures and enable cutting-edge new services and business models.
- Blockchain technology is already being used in numerous worldwide logistics projects, bringing value by increasing supply chain transparency and streamlining administrative tasks. We can expect blockchain technology to combine with other advancements in the future to have a greater influence. Consider how the use of blockchain can improvethe coordinationand synchronisationofthephysicalflowofgoodswithinformationandfinancialflows.

Dr.M.Akila
Assistant Professor, Sri Ramachandra Faculty of Management Studies
Sri Ramachandra institute of Higher education and research Porur, Chennai

Abstract
The cement industry is a key driver of India's infrastructure development and economic growth, with UltraTech Cement emerging as the largest producer in both domestic and global markets. Assessing the financial performance of this industry leader is crucial for investors, policymakers, and stakeholders, as it reflects operational efficiency and market competitiveness. This study examines UltraTech Cement's financial performance over five years using secondary data from the company's annual reports and trusted financial sources. The analysis focuses on OPM, NPM, and EPS to evaluate profitability, operational efficiency, and shareholder returns. The study looks at five years of data to see how the company makes money and spends it. It shows what the company is good at and what needs improvement. The results help people understand the company's financial health.
Keywords: UltraTech Cement, Financial Performance, Earning per share

1. INTRODUCTION

The cement industry plays a vital role in India's infrastructure development and economic growth. It supports sectors such as construction, housing, roads, and industrial projects, making it a key component of the economy. UltraTech Cement, established in 1983 and headquartered in Mumbai, is the largest cement producer in India and a leading player globally. The company is part of the Aditya Birla Group and has a strong presence across domestic and international markets. UltraTech operates more than 20 integrated cement plants, over 25 grinding units, and has a widespread distribution network. The company produces a wide range of cement products, It is known for adopting advanced technology, sustainable practices, and innovative solutions in cement production. Financial performance reflects operational efficiency, profitability, and the ability to create shareholder value. The cement industry faces challenges such as fluctuating demand, raw material costs, and economic policies that impact performance. Ratio analysis is a useful tool to simplify financial data and assess profitability, liquidity, solvency, and efficiency. This study examines UltraTech Cement's financial performance over a five-year period using secondary data from annual reports and trusted financial sources. The research contributes to evaluating how UltraTech balances operational efficiency with strategic growth in a dynamic business environment.

2 .Objectives Of The Study

- To analyze the operational efficiency of UltraTech Cement using Operating Profit Margin.
- To evaluate the company's overall profitability through Net Profit Margin.
- To assess the shareholder value using Earnings Per Share.

2.1 Review Of Literature

- Prof. K. Jayachandra Reddy&AravamDhanunjayulu(2022) A Study On Financial Performance Of Ultratech Cement Ltd And Ambuja Cements Ltd-ISSN: 2278-4632 –in this author compare the financial data of both the cement company and conclude it ultra tech equity share capital is better than Abuja cements ltd
- A Study On Financial Performance Of Cement Companies In India With Reference to Ultratech Cement Limited and OCL India Limited - A Comparative Analysis - Mrs.N.Sumathi1 , Dr. K. Jothi2" The authors studied the financial performance of UltraTech Cement and OCL India by examining their profits and short-term financial health. They noted that the Indian cement industry is growing due to housing and infrastructure demand. They concluded that both companies are financially stable but need to improve short-term solvency."

3. RESEARCH METHODOLOGY

3.1 Research Design

The study is descriptive and analytical**,** aiming to evaluate financial performance using secondary data from the website, the selected period of study five years (2021–2025) to understand trends over time.

3.2 Data Collection

In this Study the Secondary data have been used. ,Sources include Ultra Tech Cement annual reports, balance sheets, profit &loss statements**,** and published financial statements.

3.3 Tools and Techniques

- Operating Profit Margin **:** Operational efficiency.
- Net Profit Margin **:** Overall profitability.
- Earnings Per Share **:** Shareholder value.

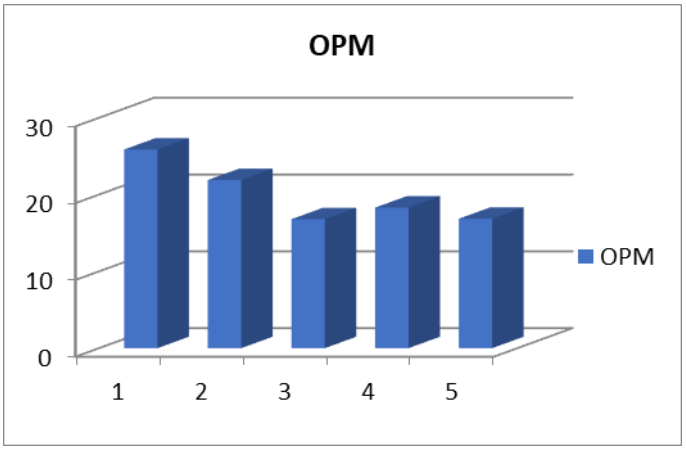
3.4 Scope of the study

- The scope covers the financial performance of UltraTech Cement for the period 2021–2025 using ratio analysis. It consist three key indicators: Operating Profit Margin, Net Profit Margin, and Earnings Per Share.

3.5 Limitations of study

- The analysis is based only on secondary data from published reports, which may not reflect real-time changes.
- The study is limited to three ratio so other aspects of financial performance are not covered.

4. Data Analysis And Interpretation



(i) Operating Profit Margin

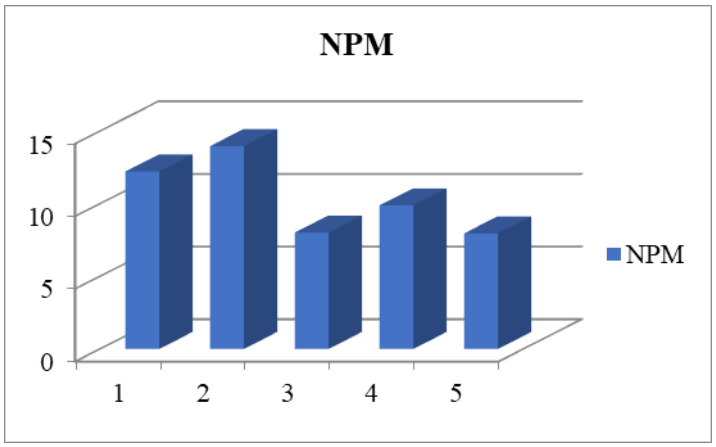
- Operating Profit Margin shows how much profit a company earns from its core operations compared to sales. It helps to measure how efficiently the company controls its operating costs. A higher margin indicates better operational efficiency and profitability.

Formula : OPM = (Operating Profit ÷ Net Sales) × 100

Table 1 : Operating Profit Margin for Ultra tech Cement

S.NO	YEAR	OPERATING PROFIT	NET SALES	OPM
1	2021	11567.91	44725.8	26
2	2022	11514.35	52598.83	22
3	2023	10619.85	63239.98	17
4	2024	12978.56	70908.14	18
5	2025	12796.88	75955.13	17

Interpretation:



- The Operating Profit Margin of the company shows a declining trend from 26% in 2021 to 17% in 2025, indicating rising costs or reduced efficiency despite growing sales. Although sales increased steadily over the five years, profitability did not keep pace. This suggests that the company needs better cost control and operational efficiency to maintain margins.

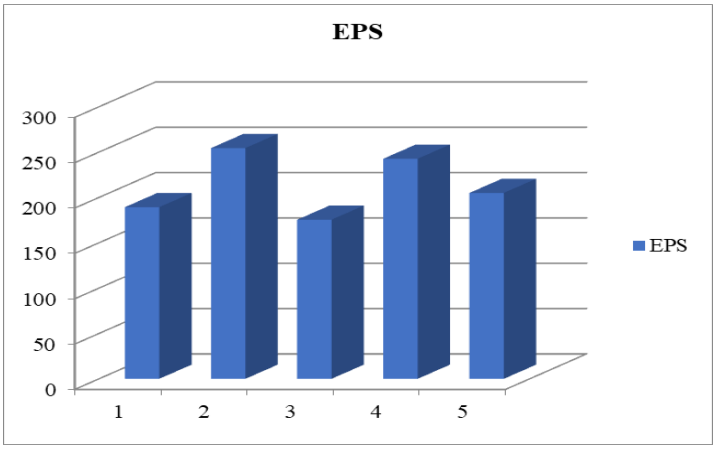
(ii) Net Profit Margin

- Net Profit Margin shows how much net profit a company makes from its total sales after deducting all expenses, interest, and taxes. It explains how effectively the company converts revenue into actual profit. A higher margin indicates stronger profitability and better cost management.

Formula: NPM = (Net Profit ÷ Net Sales) × 100

Table 2 : Net Profit Margin for Ultra tech Cement				
S.NO	**YEAR**	**NET PROFIT**	**NET SALES**	**NPM**
1	2021	5463.1	44725.8	12
2	2022	7344.31	52598.83	14
3	2023	5063.96	63239.98	8
4	2024	7005	70908.14	10
5	2025	6039.11	75955.13	8

Interpretation:



- The Net Profit Margin of UltraTech Cement shows fluctuations over the five-year period. It increased from 12% in 2021 to a peak of 14% in 2022, indicating improved profitability. However, it declined to 8% in 2023, slightly recovered to 10% in 2024, and fell again to 8% in 2025. This variation suggests that while the company manages costs and expenses effectively at times, external factors or increased expenses may have impacted overall profitability in certain years. Overall, the NPM indicates moderate but inconsistent profit generation relative to sales.

(iii) Earnings per share

- Earnings Per Share shows the portion of a company's net profit allocated to each equity share and indicates how much profit is earned for each share held by investors. It helps assess the company's ability to generate returns for shareholders and reflects financial performance from a shareholder perspective.

Formula: EPS = Net Profit ÷ Number of Equity Shares

Table 3 : Earnings Per share for Ultra tech Cement				
S.NO	**YEAR**	**NET PROFIT AFTER TAX**	**NO OF SHARE**	**EPS**
1	2021	5463.1	28.865	189
2	2022	7344.31	28.867	254
3	2023	5063.96	28.869	175
4	2024	7005	28.869	243
5	2025	6039.11	29.468	205

Interpretation:

- The EPS of UltraTech Cement increased from 189 in 2021 to 254 in 2022, showing higher profitability for shareholders. It dropped to 175 in 2023, then rose again to 243 in 2024 before slightly falling to 205 in 2025. This shows that shareholder returns have been generally positive but vary with changes in net profit.

5. Findings And Suggestions:

Findings:

- Operating Profit Margin shows a declining trend from 26% in 2021 to 17% in 2025, indicating rising costs or lower operational efficiency despite increasing sales.
- Net Profit Margin fluctuates, peaking at 14% in 2022 but falling to 8% in 2023 and 2025, suggesting inconsistent profitability after accounting for all expenses.
- Earnings Per Share generally increases with net profit, peaking at 254 in 2022, but declines in 2023 and 2025, reflecting the impact of lower net profits on shareholders' returns.

Suggestions:

- Focus on cost control and operational efficiency to improve OPM, which can help sustain overall profitability.

- Implement strategies to stabilize net profits, such as diversifying revenue streams or optimizing expenditure, to provide consistent returns to shareholders.

CONCLUSION

The financial analysis of UltraTech Cement using selected ratios indicates that the company has experienced fluctuations in profitability over the study period from 2021 to 2025. The declining trend in Operating Profit Margin from 26% to 17% suggests that operational efficiency has reduced or costs have increased despite growing sales. Net Profit Margin shows inconsistency, peaking in 2022 at 14% but falling to 8% in 2023 and 2025, highlighting challenges in controlling overall expenses. Earnings Per Share follows a similar pattern, rising with higher net profits in 2022 but declining in years of lower profitability, affecting shareholder returns. Overall, while UltraTech Cement demonstrates potential in revenue generation, the company needs to focus on cost management and operational efficiency to achieve stable and consistent profitability. These findings emphasize the importance of strategic planning to sustain growth and enhance returns for investors.

SOCIAL MEDIA MARKETING AND INFLUENCE: TRENDS, STRATEGIES, AND IMPACTS

Dr.N.Chandru
Department of commerce, Dr.N.G.P Arts and Science College , Coimbatore
Ms.P.Vasuki Devi
School of Management , A.V.P College of Arts and Science ,Tirupur

Abstract
The emergence of social media has revolutionized marketing by transforming consumers into active participants in brand communication. Platforms such as Facebook, Instagram, TikTok, and LinkedIn have become key drivers of influence, enabling direct interaction, targeted campaigns, and the rise of influencer-driven marketing. This paper examines the trends, strategies, and impacts of social media marketing, with particular focus on consumer behavior, influencer credibility, and ethical considerations. It concludes by outlining future directions, including artificial intelligence (AI), immersive technologies, and social commerce.
Keywords— Social media marketing, influencer marketing, consumer behavior, brand engagement, digital strategies

I. INTRODUCTION

In the digital economy, marketing is no longer limited to television, print, or outdoor media. Social media has emerged as a dominant force, creating interactive and personalized experiences for consumers worldwide. With over 4.8 billion global users in 2023 [1], social platforms are not only communication tools but also powerful marketing ecosystems.
Unlike traditional marketing, which is largely one-directional, social media marketing (SMM) emphasizes dialogue, engagement, and co-creation. Influencers, brand communities, and data-driven personalization contribute to shaping modern consumer journeys. However, questions of trust, authenticity, and ethics remain central to the debate.

II. Literature Review

- Social media has shifted power from corporations to consumers. According to Kaplan and Haenlein [2], SMM enables brands to foster relationships through interactive content, while Mangold and Faulds [3] highlight its role as a hybrid of traditional and word-of-mouth marketing.
- Influencer marketing, in particular, has been studied extensively. Research shows that micro-influencers, despite having fewer followers, often achieve stronger engagement rates due to authenticity [4]. However, concerns over fake followers, paid endorsements, and declining trust highlight the need for transparent practices [5].

III Objectives of the study

1. To analyze the role of social media platforms in shaping modern marketing strategies
2. To examine the effectiveness of influencer marketing in building consumer trust and driving purchase decisions
3. To explore the impact of social media on consumer behavior, including dcisio making, engagement and brand loyalty
4. **To provide recommendations for brands, markeeters and policymakers to leverage social medial influence responsibility and sustainability**

IV Research Methodology

A. Research Design

The study adopts a descriptive and exploratory research design, combining qualitative and quantitative approaches to examine the influence of social media marketing on consumer behavior and brand engagement.

B. Data Collection Methods

- Academic journals, industry reports (e.g., Nielsen, Statista, Influencer Marketing Hub), and conference proceedings were reviewed to understand current trends and theoretical foundations of social media marketing.
- Case studies of leading brands using social media strategies were analyzed**..**

C. Sampling Technique

- Sampling Method: Purposive and convenience sampling, focusing on individuals with significant exposure to social media advertising.

D. Data Analysis Tools

- Qualitative Analysis: Thematic analysis of interviews and case studies will help identify patterns related to authenticity, engagement, and ethical concerns.

V. Social Media Marketing Strategies

A. Content Marketing

Effective SMM relies on high-quality content tailored to audience interests. Short-form videos, live interactions, and interactive polls drive higher engagement compared to static posts.

B. Influencer Marketing

Influencers act as “trust mediators” between brands and consumers. Their recommendations are often perceived as more authentic than traditional ads. Micro-influencers (10,000–100,000 followers) are especially effective in niche markets [4].

C. Data-Driven Personalization

AI and analytics enable brands to deliver personalized messages, enhancing conversion rates. Predictive algorithms identify consumer preferences and optimize campaign reach.

D. Community Engagement

Successful brands build communities around shared values, such as sustainability or inclusivity, thereby generating loyalty beyond transactional relationships.

VI. Influence on Consumer Behavior

Social media influences consumer decision-making by providing social proof (reviews, likes, shares) and emotional connection (relatable storytelling). Studies show that over 70% of millennials consider peer reviews before making purchases [6].

However, the “influence economy” also carries risks:

- Misinformation spreads rapidly.
- Unrealistic portrayals of lifestyle affect mental well-being.
- Over-commercialization leads to consumer fatigue.

VII. Challenges and Ethical Considerations

- Authenticity vs. Manipulation: Excessive paid endorsements reduce trust.
- Data Privacy: Targeted advertising raises legal and ethical concerns.
- Algorithmic Bias: Platforms prioritize content visibility based on algorithms, limiting exposure to diverse perspectives.
- Mental Health Impacts: Exposure to curated influencer lifestyles can negatively affect self-image.

VIII. Future Directions

1. Artificial Intelligence (AI): Predictive analytics will personalize consumer journeys further.
2. Augmented and Virtual Reality (AR/VR): Immersive marketing campaigns will enhance engagement.
3. Social Commerce: Seamless in-app purchases will redefine digital transactions.
4. Ethical Influence: Transparency in influencer collaborations will be vital to rebuild consumer trust.

CONCLUSION

Social media marketing has redefined brand communication, creating both opportunities and ethical challenges. While influencer culture and data-driven strategies offer powerful tools, they must be balanced with transparency and consumer well-being. Future marketing success will depend on integrating technology with ethical responsibility, ensuring that influence fosters trust rather than manipulation.

MONETARY POLICY IN INDIAN ECONOMY

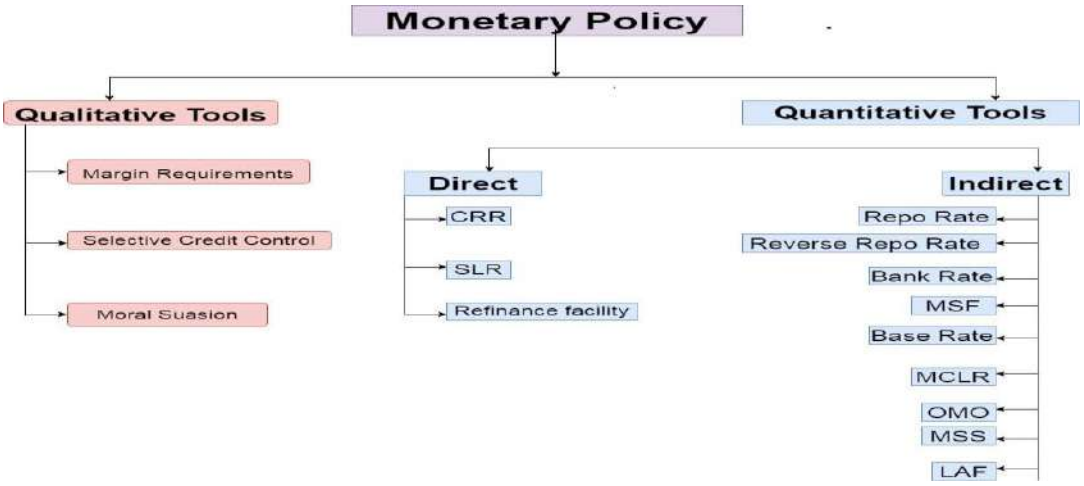
Dr. A. Devikala
Associate Professor in Economic, Department of Commerce, RVS College of Arts and Science, Coimbatore

Abstract
Monetary policy is one of the most important instruments of economic policy in India, implemented by the Reserve Bank of India (RBI) to regulate money supply, credit, and interest rates in the economy. Its primary objective is to maintain price stability while ensuring adequate liquidity for economic growth. Over the years, India's monetary policy has evolved from a developmental focus in the post-independence period to a modern framework that emphasizes inflation control, financial stability, and inclusive growth. With the introduction of the Monetary Policy Committee (MPC) and the adoption of Flexible Inflation Targeting (FIT) in 2016, monetary policy in India has become more systematic, transparent, and accountable. The RBI employs a mix of quantitative tools (repo rate, CRR, SLR, OMOs) and qualitative tools (credit rationing, margin requirements) to achieve its objectives. In the current context of globalization, volatile capital flows, and changing domestic growth dynamics, monetary policy remains central to balancing inflation, exchange rate stability, and economic development.
Key Note: Monetary Policy, Indian Economy, Reserve Bank of India, Inflation Targeting, Financial Stability, Monetary Policy Committee

INTRODUCTION

Monetary policy is a key instrument of economic management used by the Reserve Bank of India (RBI) to regulate the supply of money, credit, and interest rates in the economy. Its primary objectives are to maintain price stability, ensure financial stability, and promote economic growth.In India, monetary policy plays a crucial role in balancing inflation control with the need for adequate liquidity to support development. The RBI uses both quantitative tools (such as repo rate, reverse repo rate, cash reserve ratio, statutory liquidity ratio, and open market operations) and qualitative tools (such as credit rationing and regulation of consumer credit) to influence credit flow and money supply.

The policy framework has evolved over time shifting from a traditional focus on controlling inflation and maintaining exchange rate stability to also addressing modern challenges like growth promotion, financial inclusion, and managing external shocks.The adoption of the Flexible Inflation Targeting (FIT) framework under the Monetary Policy Committee (MPC) in 2016 marked a significant milestone. The RBI now formally targets consumer price inflation within a band of 4% ± 2%, thereby institutionalizing transparency and accountability in policy decisions.



Thus, monetary policy in India is not just about managing money but also about shaping the broader macroeconomic environment, ensuring sustainable growth, and safeguarding the economy from volatility.

Objectives of Monetary Policy in India

The objectives of India's monetary policy are multifaceted and dynamic, depending on the stage of economic development. Key objectives include:

Price Stability: To control inflation and maintain the purchasing power of money.
Economic Growth: To ensure adequate credit supply for investment and production.
Financial Stability: To safeguard the financial system from crises and maintain confidence.

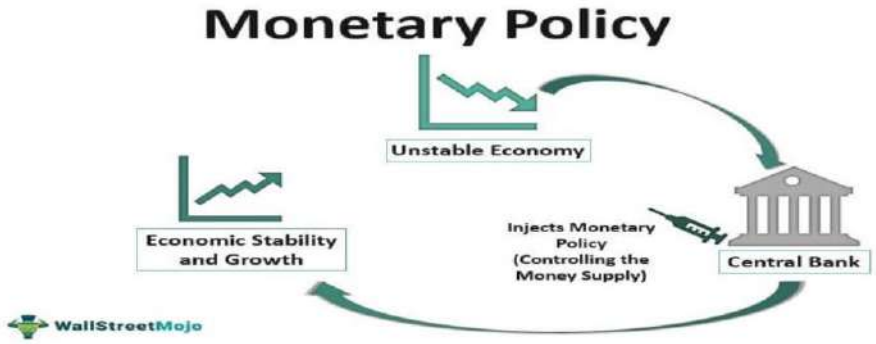
Exchange Rate Stability: To manage volatility in foreign exchange markets.
Employment Generation: By stimulating investment and industrial growth.
Balanced Development: Promoting inclusive growth through targeted credit flows.

Instruments of Monetary Policy
The RBI employs two types of instruments:
Quantitative (General) Tools

- **Repo Rate & Reverse Repo Rate** – Regulating short-term liquidity.
- **Cash Reserve Ratio (CRR)** – Mandatory reserves with RBI to control money supply.
- **Statutory Liquidity Ratio (SLR**) – Maintaining stability through compulsory investment in government securities.
- **Open Market Operations (OMO**) – Buying and selling government securities to adjust liquidity.

Qualitative (Selective) Tools

- Credit Rationing– Limiting credit flow to speculative or non-essential activities.
- Margin Requirements – Controlling speculative lending.
- Consumer Credit Regulation – Restricting installment credit.



Evolution of Monetary Policy in India

- **1950s–1970s:** Development-oriented, focused on channeling credit to priority sectors.
- **1980s:** Rising inflation led to more emphasis on price stability.
- **1991:** Economic Reforms: Shift toward liberalization and market-oriented policies.
- **2000s:** Focus on inflation management and financial sector reforms.
- **2016 Onwards:** Formal adoption of Flexible Inflation Targeting (4% ± 2%) and establishment of the Monetary Policy Committee (MPC).

Monetary Policy Committee (MPC)
The MPC, introduced in 2016, consists of six members (three from RBI and three nominated by the Government of India). It sets the repo rate to achieve the inflation target of **4% with a tolerance band of ±2%**. This reform enhanced transparency, credibility, and accountability in policy decisions.

Role of Monetary Policy in the Indian Economy

- Stabilizes inflation while ensuring adequate liquidity.
- Supports government initiatives such as financial inclusion, MSME credit, and rural development.
- Manages external shocks, such as global oil price fluctuations and capital outflows.
- Plays a countercyclical role during crises (e.g., COVID-19, global financial crisis).

Challenges of Monetary Policy in India

- **Dual Mandate:** Balancing inflation control with growth needs.
- **Structural Issues:** Supply-side constraints such as agriculture dependence and infrastructure bottlenecks.
- **Global Factors:** Volatility in foreign capital flows and exchange rates.
- **Fiscal-Monetary Coordination:** Balancing RBI's independence with government borrowing needs.
- **Transmission Mechanism:** Ensuring policy rate changes reflect effectively in lending rates.

Recent Trends and Developments

- **COVID-19 Measures:**RBI reduced repo rates, announced moratoriums, and introduced liquidity facilities to support growth.

- **Digital Economy Impact:** Rise of digital payments, fintech, and CBDC (Digital Rupee) influencing monetary management.
- **Green Finance:** Emerging role of monetary policy in promoting sustainable investments.

CONCLUSION

Monetary policy in India has matured from a developmental tool to a sophisticated mechanism balancing inflation and growth in a liberalized, globalized economy. With the establishment of the MPC and the adoption of inflation targeting, India's monetary policy framework has become more credible and transparent. However, structural challenges, global uncertainties, and the evolving nature of financial markets require continuous adaptation. Going forward, monetary policy will play a pivotal role not only in stabilizing the economy but also in guiding it toward sustainable and inclusive growth.

In summary, by August 2025, Indian monetary policy adopted a balanced approach, utilizing prior rate cuts to stimulate growth while maintaining vigilance against global headwinds. The policy was underpinned by lower inflation and stable domestic growth, with the neutral stance providing flexibility for future action.

CORPORATE SOCIAL RESPONSIBILITY IN INDIA: TRENDS, CHALLENGES, AND FUTURE DIRECTIONS (2010–2025)

Mr. R. Suresh
Assistant Professor, Department of Computer Science
Ms.R.V.VishnuRekka, Mr S.Nitheesh Kumar
I M Com CS, Dr.N.G.P.Arts and Science College, Kalapattiroad, Coimbatore

Abstract
Corporate Social Responsibility (CSR) has evolved from a philanthropic concept to a strategic business imperative in India. Following the Companies Act, 2013, CSR became a mandatory practice for qualifying firms, transforming corporate behavior toward sustainable and inclusive growth. This study explores the evolution, trends, challenges, and future directions of CSR in India from 2010 to 2025. It draws insights from secondary data, government reports, and previous studies to analyze CSR implementation, expenditure patterns, and sectoral distribution. Findings reveal that while CSR spending has grown consistently, regional and thematic imbalances persist. The paper proposes a strategic CSR framework integrating technology, sustainability, and stakeholder collaboration for maximizing socio-economic impact.
Keywords: Corporate Social Responsibility, Sustainable Development, Companies Act 2013, CSR Trends, India, Inclusive Growth

I. INTRODUCTION
Corporate Social Responsibility (CSR) represents an organization's ethical commitment to contribute to economic development while improving the quality of life of its workforce, local community, and society at large. The globalization era and socio-environmental pressures have compelled companies to integrate social responsibility into their business strategy. In India, CSR has deep historical roots, from philanthropic donations by business families such as the Tatas and Birlas to a legally mandated responsibility post-2013. The Companies Act made CSR compulsory for firms with a net worth of ₹500 crores, turnover of ₹1,000 crores, or profit of ₹5 crores, mandating at least 2% of average net profit to be spent on CSR activities [3]. This paper aims to analyze CSR evolution, implementation, and emerging challenges, providing insights for policy improvement and sustainable corporate engagement.

II. Review of Literature
- Singh and Yadav [3] analyzed contemporary CSR challenges such as lack of transparency, limited community engagement, and weak NGO participation. These studies collectively reveal a gradual shift from token philanthropy to structured sustainability, though strategic alignment remains limited.
- Global studies including Mahmud et al. [4] and Cheema-Fox et al. [5] highlight CSR's role in resilience and stakeholder trust during crises such as COVID-19, showing its strategic value beyond compliance.
- Barin and Ansari [6] emphasized integrating environmental perspectives into CSR frameworks. Reena Shyam [7] and Ghosh [8] examined CSR disclosure trends and policy structures, while Bala Madhu and Singh Narender [9] compared CSR practices across private firms using factor analysis.

- Further, Khan and Hassan [10], Enock and Basavaraji [11], and Bhupender and Joshiya [12] focused on CSR domains, spending trends, and challenges. Jain [13], Ghose [14], and Taj [15] explored sustainable CSR practices and evaluation mechanisms.
- Gautam and Singh [2] evaluated 500 Indian firms and found that only 49% reported CSR activities, mostly philanthropic and non-strategic. Sarkar [1] later confirmed this pattern, noting a gradual transition to compliance-driven CSR.

III. Objectives of the Study

1. To trace CSR evolution in India between 2010–2025.
2. To analyze spending trends, sectoral distribution, and compliance.
3. To identify key challenges in CSR implementation.
4. To propose a future framework for effective CSR governance.

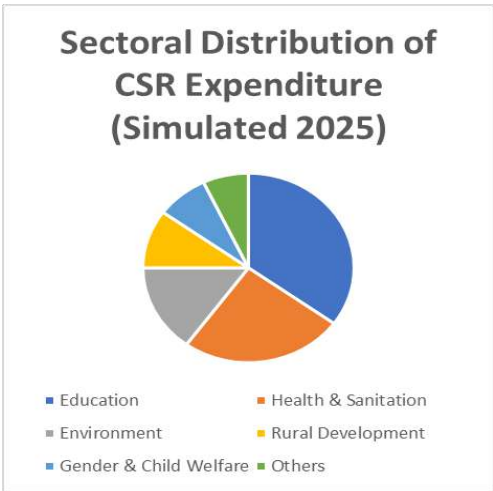
Iv. Methodology

The study employs **secondary data analysis**, drawing information from:

- Ministry of Corporate Affairs (National CSR Data Portal)
- CSR reports (2015–2024)
- Academic literature [1]– [3]
- CSR surveys by KPMG, PwC, and CII

Data were synthesized into simulated tables and charts for comparative insights on sectoral spending, regional focus, and company compliance patterns.

V. CSR trends in INDIA (2010–2025)



CSR expenditure in India has risen sharply since its legal mandate in 2013. Initially, compliance hovered around 60%, improving to nearly 90% by 2022. Key areas of spending include education, health, environmental sustainability, and rural development.

Table I — Simulated CSR Expenditure Growth (₹ Crores)

Year	CSR Spending	Growth %	Compliance Rate
2014	5,115	—	60%
2017	7,216	+41%	72%
2020	9,305	+29%	84%
2023	12,480	+34%	90%
2025*	14,200	+14%	92%

*Source: Simulated data based on KPMG and MCA reports [10], [11].

Fig. 1 — Sectoral Distribution of CSR Expenditure (Simulated 2025)

Sector	Share (%)
Education	35
Health & Sanitation	25
Environment	15
Rural Development	10
Gender & Child Welfare	8
Others	7

These trends demonstrate a steady prioritization of human capital development and sustainability-focused initiatives

VI. Major Challenges

Despite progress, CSR implementation faces persistent obstacles [3]:

1. **Regional Imbalance:** Over 60% of CSR funds are concentrated in five states—Maharashtra, Karnataka, Gujarat, Tamil Nadu, and Andhra Pradesh—while states like Bihar and Odisha remain underserved.
2. **Transparency Issues:** Lack of standardized impact assessment leads to inconsistent reporting.
3. **Capacity Gaps:** Many NGOs lack adequate technical and managerial capabilities.
4. **Short-Term Focus:** Companies often emphasize visibility over long-term community transformation.
5. **COVID-19 Realignment:** Pandemic-era relief temporarily diverted CSR funds from development to crisis management.

VII. Future Directions

To enhance CSR's transformative potential, the following strategies are recommended:

- **Integrated CSR Strategy:** Align CSR activities with the UN Sustainable Development Goals (SDGs).
- **Digital CSR Platforms:** Employ blockchain and AI for transparent tracking of fund utilization.
- **Regional Equity Framework:** Provide incentives for companies investing in backward regions.
- **Capacity Building:** Train NGOs and CSR officers in monitoring, evaluation, and impact measurement.
- **Social Innovation:** Expand CSR into renewable energy, digital literacy, and rural entrepreneurship.
- The following framework outlines a forward-looking approach to Corporate Social Responsibility (CSR) in India, emphasizing sustainability, accountability, and measurable social outcomes.

Inputs	Processes	Outcomes	Impact
Corporate Funds	**Sustainable Project Planning**	**Community Empowerment**	**Inclusive Growth**
Financial and non-financial CSR investments from corporations	Strategic alignment of CSR projects with UN SDGs, ESG goals, and local development priorities	Enhanced livelihoods, skill development, and socio-economic resilience of target groups	Long-term reduction in inequality, sustainable development, and national progress

This strategic framework envisions a systematic flow from corporate resource allocation to tangible community and national benefits. It emphasizes sustainability-oriented project design, impact measurement, and multi-stakeholder collaboration to ensure inclusive and equitable growth during the period 2025–2030.

Conclusion

CSR in India has evolved from philanthropic gestures to a structured, law-governed mechanism supporting inclusive development. However, persistent disparities, weak impact evaluation, and limited innovation restrict its transformative potential. The next phase of CSR must integrate sustainability metrics, technology-driven transparency, and equitable regional outreach, aligning corporate accountability with national development priorities.

Abstract
Social media marketing(SMM), has become an essential part of contemporary business strategy. Businesses now have an unparalleled chance to instantly reach a global audience thanks to the billions of active users on social media sites like Facebook, Instagram, Twitter, LinkedIn, and TikTok. Posting content is only one aspect of social media marketing (SMM); other tactics include influencer marketing, content marketing, paid advertising, engagement tactics, and hashtag campaigns. These tactics assist brands in gaining more recognition, fostering trust, and fortifying their bonds with consumers. Effective campaign planning, execution, and analysis are made simpler for marketers by a number of tools, including Hootsuite, Canva, Buffer, Google Analytics, and Sprout Social.Furthermore, distinctive strategies like social commerce, employee advocacy, meme marketing, live streaming, and storytelling enable brands to engage with consumers in novel ways. Businesses can boost sales, increase brand recognition, and stay competitive in the digital market by utilizing these tools and tactics. Additionally, social media offers useful information about consumer behavior, which aids businesses in making wise choices. Understanding social media marketing is crucial for companies looking to expand, interact with consumers, and cultivate enduring client loyalty in the fast-paced digitalera.
Keywords: Customer engagement, social media tools, influencer marketing, content marketing, and social media marketing

INTRODUCTION

Social media has evolved into much more than just a way to keep in touch with friends and family in the current digital age. It has developed into one of the most effective tools for individuals, companies, and brands to promote their goods, services, and concepts. The use of social networking sites like Facebook, Instagram, Twitter, LinkedIn, and YouTube to increase brand recognition, customer interaction, and sales is known as social media marketing, or SMM. Social media marketing is interactive, affordable, and available to companies of all sizes, in contrast to traditional marketing, which frequently depends on radio, print, or television.The ability of social media marketing to instantly reach a large and varied audience is one of its main benefits. Every day, millions of people use social media platforms, which enables companies to present their goods to a worldwide customer base. Businesses can even select the demographics they wish to reach through targeted ads by taking into account variables like age, location, hobbies, and online activity. Traditional marketing rarely provides this degree of accuracy.Engagement is a key component of social media marketing. Social media enables two-way communication, in contrast to traditional advertising, which only allows information to flow in one direction. By liking, sharing, or commenting on brands' posts, customers can communicate with them directly. In addition to fostering trust, this real-time feedback aids companies in comprehending the wants and needs of their target market. A strong social media presence has the power to convert followers into devoted clients and brand ambassadors.For social media marketing to be successful, content is essential. To draw in and hold on to customers, businesses use a variety of content formats, including blogs, live sessions, stories, videos, and images. Content that is relatable and

creative has the potential to go "viral," reaching millions of users for free. For this reason, companies spend money on social media managers, influencers, and content producers who understand how to pique audience interest and uphold a compelling brand image.To sum up, social media marketing has completely changed how companies interact with their customers. It provides exceptional chances for product promotion, relationship building, and visibility expansion in fiercely competitive markets.

Benefits Of Social Media For Small Businesses

Greater Reach

Businesses can instantly share information and updates with their audience thanks to social media. The message reaches people instantly, whether it's a significant announcement, a discount, or the launch of a new product. Customers are informed and involved thanks to this prompt communication. Additionally, it enables brands to react to changes in the market more quickly.

Economical Marketing

Social media campaigns are far less expensive than print or television advertisements. Effective product promotion is possible even for small businesses with tight budgets. Businesses can only spend as much as they can afford when using paid advertisements. Marketing becomes more adaptable and effective as a result.

Advertising That Is Targeted

Social media offers sophisticated tools for focusing on particular demographics. Age, interests, location, and even online activity can all be used to display ads. This guarantees that the appropriate audience hears the message.

Improved Interaction with Customers

Social media enables two-way communication, in contrast to conventional techniques. Consumers can interact in real time by liking, commenting, and sharing posts. The audience and the brand develop closer bonds and greater trust as a result. Loyal supporters are more likely to be engaged customers.

Increases Recognition of the Brand

Regularly publishing original content keeps a brand fresh in consumers' minds. Businesses can display their identity, values, and products on social media. People become more familiar with the brand the more they see it and engage with it. Naturally, greater visibility breeds greater trust.

Increases Client Trust

Social media recommendations from friends, family, or influencers seem more real than traditional advertisements. Because of the social proof that these recommendations provide, new customers are more inclined to try the brand. Long-term loyalty and increased conversions are frequently the results of this trust factor.

Effective Tools And Tactics In Social Media Marketing

Tools

Canva

One of the best tools for making visually appealing posts, stories, and graphics. It is well-liked due to its free templates and ease of use.

Hootsuite

One of the most established and reliable tools for managing and scheduling posts on various platforms. widely utilized by companies of all kinds.

Google Analytics
Is crucial for monitoring the amount of traffic that websites receive from social media. It aids in gauging the success of campaigns.
Zoho Social
Helps businesses monitor multiple social media accounts, schedule posts, and analyze campaign results.
Adobe Spark
A user-friendly design tool for making graphics, animations, and brief videos for social media

Tactics

- Marketing Content
  The foundation of social media marketing is content. Brands add value to their audience by sharing reels, stories, videos, and blogs. In addition to providing information, high-quality content engages and entertains viewers. It fosters enduring client loyalty and trust.
- Marketing through Influencers
  Brands can reach their communities and followers by collaborating with influencers. Influencers' recommendations seem sincere because they already enjoy credibility and trust. This enables companies to swiftly reach new audiences. Additionally, it increases sales conversions and brand awareness.
- Advertising That Is Paid
  Paid advertising options are available on sites like Facebook, Instagram, and LinkedIn. Location, interests, or behavior can all be used to target these advertisements. Campaigns that are paid for guarantee that the right people hear the message.
- Strategy for Engagement
  Social media is about interaction, not just posting. Brands demonstrate their concern for their customers by responding to reviews, messages, and comments. A devoted community is created around the company through active engagement. It builds a positive brand image and fortifies relationships.
- The Use of Hashtags
  Similar to keywords, hashtags raise the visibility of content. Posts can reach a wider audience by utilizing relevant and trending hashtags. A well-chosen hashtag mix links the brand to broader discussions. This raises the likelihood of going viral and drawing in new clients.

Trends In Social Media Marketing

- Marketing with Storytelling
  Brands post brief but interesting updates on Snapchat, Facebook Stories, and Instagram Stories. There is a sense of urgency to watch these stories because they typically vanish within a day. It enables companies to showcase exclusive content, deals, or short cuts. Audiences are intrigued by this type of marketing because it feels intimate.
- Marketing through Live Streaming
  Real-time interaction is increased by going live on websites like Facebook, Instagram, and YouTube. Live sessions are used by brands for tutorials, Q&A sessions, and product launches. Because viewers see unaltered, authentic content, it fosters authenticity. Brand loyalty and trust are increased by this open communication.
- Marketing for Social Commerce

Users can now shop directly within apps on social media platforms.Buying is made simpler by features like Facebook Marketplace and Instagram Shops.It shortens the time between viewing a product and making a purchase.This kind promotes impulsive purchases and accelerates sales.

- Marketing with Memes
  Memes that are relatable and humorous are shared to quickly attract attention. They establish a cultural and emotional connection with their audiences. Memes frequently go viral without incurring significant expenses.This gives the brand a modern, approachable look.
- Marketing for Employee Advocacy
  Employers encourage staff members to advertise products on social media.Employee sharing seems more authentic than sponsored advertisements.Since people are more likely to trust genuine voices than brand pages, it fosters trust.Additionally, this improves the reputation of the brand and company culture.
- Local Promotion
  To engage with consumers, brands create groups on Facebook, Reddit, or LinkedIn. These communities facilitate dialogue, constructive criticism, and improved connections.Being a part of a brand's circle makes customers feel appreciated. By giving audiences a sense of inclusion, it fosters loyalty.

Successful Social Media Campaigns and Their Impact

- Nike's "Just Do It" campaign
  Nike successfully promoted their catchphrase on social media. Nike posted inspirational videos, athlete biographies, and user-generated content on Instagram and Twitter. As a result of the campaign's encouragement of participation, followers shared their personal athletic experiences. Globally, it increased brand awareness and bolstered client loyalty.
- Share a Coke with Coca-Cola
  Coca-Cola used social media to advertise the campaign and personalize bottles with names. Users were urged to post pictures of their bottles on the internet. Word-of-mouth advertising and enormous engagement resulted from this. The campaign became one of the most memorable social media marketing campaigns and boosted sales.
- Starbucks' #RedCupContest
  Every year, Starbucks hosts a contest to encourage customers to share imaginative pictures of their holiday-themed cups. The campaign reaches millions of followers by using the hashtag #RedCupContest. At no extra cost, it creates buzz, strengthens brand identity, and supports user-generated content.

CONCLUSION

In today's digital world, social media marketing has become a vital tool for companies. It enables brands to interact with consumers in real time, instantly reach a worldwide audience, and create enduring bonds. Businesses can increase consumer loyalty and brand recognition by implementing tactics like influencer partnerships, paid advertising, content marketing, and community involvement. Using cutting-edge tools like Hootsuite, Canva, Buffer, and Google Analytics improves campaign management effectiveness and yields quantifiable results. Furthermore, distinctive strategies like employee advocacy, social commerce, live streaming, and storytelling help brands stand out in a crowded digital market. Case studies of successful campaigns from companies such as Starbucks, Nike, and Coca-Cola show the value of innovative and skillfully done social media marketing. All things

considered, having a solid understanding of social media marketing is now essential for company expansion, visibility, and long-term success in the cutthroat industry of today.

COMMERCE IN TRANSITION: NAVIGATING CHANGE THROUGH INNOVATION

Dr C.Nithyakalyani
Head - Department of Commerce,
Sasurie College of Arts and Science, Vijiyamangalam

1. INTRODUCTION

Commerce has always been the foundation of economic development, linking producers and consumers through a network of exchange and value creation. Over the past few decades, however, the global commercial landscape has undergone an extraordinary transformation. Technological advancements, rapid digitalization, evolving consumer preferences, and global competition have redefined the traditional models of business operations. The concept of commerce has expanded beyond physical marketplaces into virtual platforms, creating a seamless connection between buyers and sellers across the world.

This transition is primarily fueled by **innovation**—the key driver of change and sustainability in the modern business environment. Innovation encompasses not only technological developments but also process enhancements, product diversification, and creative marketing strategies. Businesses that fail to innovate risk losing their competitive advantage, while those that embrace change achieve scalability, efficiency, and customer loyalty.

The 21st century has witnessed the emergence of digital commerce, automation, and artificial intelligence, which have collectively altered how transactions are conducted. E-commerce platforms, mobile applications, digital payments, and data-driven decision-making have become essential components of modern trade. Consumers today seek personalized, faster, and more convenient services, compelling businesses to rethink their strategies and embrace continuous innovation.

Moreover, the COVID-19 pandemic accelerated this transformation, forcing enterprises to adopt digital solutions for survival. Small and medium enterprises (SMEs), which form the backbone of developing economies, have also begun to leverage technology and innovation to reach new markets and reduce operational costs.

In this context, the present study examines how commerce is transitioning through innovation. It explores the relationship between technological adoption, business performance, and consumer satisfaction. The paper also analyzes statistical data to highlight how innovation contributes to growth, efficiency, and resilience in the commercial sector.

2. Objectives of the Study

1. To examine the impact of innovation on the transformation of modern commerce.
2. To identify the major factors contributing to commercial transition in the digital era.
3. To assess the role of technology and customer behavior in influencing business innovation.
4. To analyze statistical data reflecting the extent of digital adoption in the commerce sector.
5. To suggest strategies for businesses to effectively navigate transitions through innovation.

3. Research Methodology

This study adopts a **mixed-method approach** combining qualitative and quantitative research.

- **Primary Data:** Collected through structured questionnaires administered to 120 respondents, including small business owners, retail managers, and consumers in the Erode district.
- **Secondary Data:** Sourced from published journals, industry reports, and government publications related to digital commerce and innovation trends.
- **Sampling Technique:** Stratified random sampling to ensure representation from diverse business sectors such as retail, e-commerce, and services.
- **Data Analysis Tools:** Statistical analysis was performed using percentages, mean score analysis, and correlation methods to interpret the relationship between innovation and business performance.

4. Statistical Data Analysis

Statistical data analysis plays a crucial role in validating the relationship between innovation and the changing trends in commerce. The data collected from 120 respondents—comprising business owners, retail managers, and consumers—was analyzed using descriptive and inferential statistical methods. The focus was to determine the extent to which innovation influences growth, customer satisfaction, and operational efficiency in business activities.

4.1 Adoption of Innovative Practices

The study assessed the level of adoption of different innovative practices among commercial establishments. The findings are presented in Table 1 below.

Interpretation:
The data reveals that digital payment systems (85%) and e-commerce platforms (78%) are the most widely adopted innovations. This indicates that most businesses are moving toward cashless and online operations to enhance convenience and accessibility. The moderate use of artificial intelligence (41%) suggests that while AI is recognized as beneficial, its implementation is still in a developing stage among smaller businesses due to cost and skill constraints.

Areas of Innovation	Percentage of Adoption
Digital Payment Systems	85%
E-Commerce Platforms	78%
Social Media Marketing	72%
Artificial Intelligence Tools	41%
Cloud-Based Accounting	56%

4.2 Correlation Between Innovation and Business Growth

A correlation analysis was conducted to examine the relationship between innovation adoption and business performance indicators such as sales growth and customer retention.

Variables	Correlation Coefficient (r)
Adoption of Digital Tools and Sales Growth	0.68
Innovation Culture and Customer Retention	0.72

Interpretation:

The results show a **strong positive correlation** between innovation and business success. The correlation coefficient of 0.68 between digital tool adoption and sales growth suggests that businesses implementing technological innovation tend to experience higher revenue growth. Similarly, the value of 0.72 between innovation culture and customer retention indicates that continuous improvement and creativity significantly enhance customer loyalty.

4.3 Impact of Innovation on Business Performance

Respondents were asked to indicate the observed benefits of adopting innovative practices in their business operations. The summarized results are presented in Table 3.

Observed Impact	Percentage of Respondents
Increase in Profit Margins	68%
Improved Customer Interaction through Digital Media	74%
Reduction in Operating Costs through Automation	62%
Expansion to New Markets through E-Commerce	59%
Enhanced Decision-Making using Data Analytics	53%

Interpretation:
The findings indicate that a majority of businesses experienced tangible benefits after integrating innovation into their operations. Increased profits (68%) and improved customer interaction (74%) were the most prominent outcomes, followed by cost reduction (62%). These results affirm that innovation directly contributes to business sustainability and growth in the evolving commercial landscape.

4.4 Statistical Summary

The overall statistical evidence supports the hypothesis that innovation acts as a catalyst in the transition of commerce. Businesses that invest in technology, creativity, and process improvement demonstrate superior adaptability and long-term profitability. The data further emphasizes that innovation-driven strategies not only enhance customer experience but also strengthen competitive positioning in the market.

5. Discussion

The findings of this study highlight that innovation has become the cornerstone of commercial transformation in the modern economy. The analysis demonstrates a clear and positive association between innovation practices and overall business growth, confirming that organizations embracing technological and strategic advancements are better equipped to navigate market transitions effectively.

Innovation in commerce extends beyond the adoption of digital tools; it also encompasses creative thinking, new business models, and redefined customer engagement approaches. The high rate of adoption of **digital payment systems** and **e-commerce platforms**, as revealed in the data analysis, indicates that businesses are increasingly shifting toward digital convenience and efficiency. This trend signifies a broader transformation from traditional face-to-face transactions to technologically integrated, customer-driven interactions.

The correlation results further reinforce the argument that **innovation fosters business sustainability**. Companies that nurture an innovation-oriented culture tend to achieve higher customer retention rates and consistent sales growth. This is primarily because innovative firms continuously upgrade their processes, adapt to consumer feedback, and offer customized solutions that enhance satisfaction and loyalty.

Moreover, the study's statistical data shows that **profitability, cost reduction, and operational efficiency** have improved through automation and digitalization. The widespread use of social media for marketing has transformed communication strategies, allowing firms to reach global audiences at minimal cost. Similarly, the gradual introduction of artificial intelligence and data analytics in decision-making processes has improved forecasting accuracy, risk management, and customer insights.

However, the findings also reveal certain challenges in this transition. Small and medium enterprises (SMEs), particularly in developing regions, face limitations such as inadequate technical expertise, financial constraints, and lack of infrastructure to implement advanced innovations. This suggests that while innovation is a driver of transformation, its accessibility and impact vary depending on organizational capacity and external support systems.

In essence, commerce is evolving from a transaction-oriented activity into an **innovation-driven ecosystem** where creativity, technology, and adaptability define success. Businesses that view innovation as a continuous process rather than a one-time investment are more likely to sustain growth and remain competitive in an unpredictable market environment. The results of this study align with global research emphasizing that innovation not only drives profitability but also ensures long-term resilience and social relevance in an era of constant change.

6. Conclusion

The study concludes that commerce is undergoing a remarkable transition, largely driven by the forces of innovation and technological advancement. Businesses today operate in an environment characterized by rapid change, digital connectivity, and evolving consumer expectations. To remain relevant and competitive, organizations must recognize innovation as not merely a supportive function but as the **core strategic element** shaping every aspect of commercial activity.

The statistical analysis confirms that innovation has a **positive and measurable impact** on business growth, profitability, and customer satisfaction. Firms that adopt digital technologies—such as e-commerce platforms, digital payment systems, and data analytics—are more capable of enhancing efficiency and expanding market reach. Moreover, cultivating an innovation-oriented culture within organizations fosters adaptability and continuous improvement, both of which are essential for sustainability in a competitive economy.

The research also highlights the emerging challenge for small and medium enterprises (SMEs) in accessing and implementing advanced innovations due to financial and infrastructural barriers. Therefore, policymakers, industry associations, and educational institutions must work collaboratively to build innovation-friendly ecosystems that empower all levels of business.

In conclusion, the transition of commerce through innovation signifies more than technological change—it reflects a **paradigm shift in business thinking and consumer interaction**. The future of commerce will depend on how effectively businesses integrate innovation into their strategies to create value, ensure sustainability, and foster inclusive growth in a rapidly evolving global marketplace.

MARKET ADOPTION OF AI AND BLOCKCHAIN IN ACCOUNTING: BUILDING TRUST, TRANSPARENCY, AND COMPETITIVE ADVANTAGE IN FINANCIAL SERVICES

Dr. K. Myilswamy
Assistant Professor, Department of Commerce,
Kongunadu Arts and Science College, Coimbatore

Abstract

The integration of **Artificial Intelligence (AI)** and **Blockchain technology** is revolutionizing the accounting profession worldwide. Traditional accounting systems are being challenged by demands for **greater transparency, real-time reporting, predictive analytics, and fraud prevention**. AI brings automation, advanced data analytics, and intelligent decision-making capabilities, while Blockchain ensures immutability, decentralized record-keeping, and trust in financial transactions. Together, these technologies create a paradigm shift in accounting practices—moving from historical recording to proactive, real-time, and tamper-proof systems.

This paper explores the **synergistic impact of AI and Blockchain in accounting**, highlighting global use cases, benefits, challenges, and the path forward. It also addresses issues of **data security, regulatory compliance, ethical governance, and skill development**, essential for accountants to thrive in the digital era.

Keywords: Artificial Intelligence, Blockchain, Accounting, Auditing, Financial Reporting, Fraud Detection, Smart Contracts, Predictive Analytics, Real-Time Assurance

INTRODUCTION

Accounting, often described as the **language of business**, has historically revolved around the systematic recording, classification, and reporting of financial information. Its central role has always been to provide accuracy, transparency, and accountability in economic decision-making. However, the 21st century has brought with it unprecedented challenges—rising transaction volumes, globalization, digital currencies, cyber risks, and increasing demands for real-time financial insights. These developments have stretched the capacity of traditional accounting frameworks, prompting the need for technological transformation.

Two disruptive technologies—Artificial Intelligence (AI) and Blockchain—are at the forefront of this evolution. Both have individually made significant strides across industries, but their convergence in the field of accounting promises to reshape the very foundation of financial reporting, auditing, and assurance services.

AI In Accounting

Artificial Intelligence refers to the simulation of human intelligence by machines, enabling systems to perform tasks such as learning, reasoning, problem-solving, and decision-making. Within accounting, AI is being increasingly adopted forAutomating repetitive tasks such as bookkeeping, invoice processing, and reconciliation.Leveragingpredictive analytics to forecast revenues, expenses, and cash flows.Enhancingfraud detection through anomaly recognition and pattern analysis.Supportingdecision-making by providing advanced insights into financial data.By reducing human errors and speeding up processes, AI enables accountants to shift focus from transactional work to strategic advisory roles, thereby adding more value to business decision-making.

Blockchain In Accounting

Blockchain, on the other hand, is a decentralized, distributed ledger technology that records transactions in a secure, immutable, and transparent manner. Its core characteristics—immutability, consensus, and cryptographic security—make it a game-changer for accounting and auditing. Immutable transaction recording, ensuring data integrity and preventing manipulation.Smart contracts that execute agreements automatically when predefined conditions are met.Real-time auditing, reducing the need for retrospective checks.Cross-border compliance and reporting, simplifying global operations.Blockchain's promise of trust without intermediaries is especially relevant in an era when stakeholders increasingly demand transparency and accountability in financial reporting.

Review Of Literature

- **Hasan (2022)[1]**, A growing body of literature shows that AI—especially machine learning (ML), natural language processing (NLP), and robotic process automation (RPA)—is streamlining routine accounting tasks like invoicing, reconciliations, and ledger matching, while enabling analytics for forecasting, anomaly detection, and audit sampling. Reviews confirm AI's ability to boost processing speed and anomaly detection but caution about risks tied to explainability, data bias, and the reliability of AI-generated audit evidence.
- **Dai and Vasarhelyi (2017)[2]**Blockchain is recognized as a transformative technology with impact comparable to the Internet. Originally for cryptocurrency, it now spans banking, insurance, voting, and government services. Its application in accounting and assurance remains limited, though it promises real-time, verifiable, and transparent reporting, as well as more precise and timely automated auditing. This study is foundational in linking blockchain to the future of accounting and auditing.
- **Secinaro, Dal Mas, Brescia, and Calandra (2022)[3]**conducted a bibliometric and coding analysis of blockchain research in accounting, auditing, and accountability. They identified key themes such as enhanced transparency, fraud reduction, and new assurance models like triple-entry accounting. While promising conceptually, empirical evidence remains limited, and challenges persist in scalability, standardization, and ERP integration, highlighting the need for further interdisciplinary studies.
- **Schmitz and Leoni (2019)**[4]examine blockchain's disruptive potential in accounting and auditing, proposing a research agenda for emerging opportunities and challenges. They argue that distributed ledgers alter transaction verification and audit processes, reduce reconciliation needs, and strengthen audit trails. Beyond efficiency, blockchain may reshape professional roles, assurance practices, and governance, though regulation, standardization, and system integration remain key concerns.
- **Kokina, Mancha, and Pachamanova (2017)**[5]examine blockchain adoption across industries and its implications for accounting. While originating in cryptocurrency, blockchain now spans supply chains, contracts, and financial services. It can enhance data reliability, reduce reconciliation costs, and enable continuous auditing. However, implementation depends on overcoming resistance, scalability, and regulatory challenges, highlighting its potential as both an opportunity and disruption.

Research Gap

AI and blockchain are transformative for accounting, yet their market adoption—impacting trust, transparency, and competitive advantage—remains underexplored. Future research should empirically examine adoption models, stakeholder perceptions, regulatory

readiness, and strategies to bridge the gap between technological potential and real-world application.

Research Objectives

i. To examine the level of awareness and perception of AI and Blockchain technologies among financial service providers, accounting firms, and clients.
ii. To analyze factors influencing market adoption, such as trust, perceived transparency, ease of use, cost-benefit considerations, and regulatory support.
iii. To investigate the role of AI and Blockchain in building competitive advantage for accounting and financial service firms.
iv. To evaluate how trust and transparency derived from Blockchain influence customer confidence and loyalty in financial reporting and assurance services.
v. To explore marketing and communication strategies that can enhance stakeholder acceptance of AI and Blockchain-enabled accounting services.

Research Methodology

The term "methodology" describes the procedures that researchers employ to describe, comprehend, and predict events.One approach to methodically addressing the research challenge is through research technique. In it, we examine the many approaches that a researcher typically takes to analyse his research challenge and the reasoning behind them.
Sampling Technique: The technique of selecting demographic components for the sample based on their accessibility is known as convenience sampling.

Type Of Research: This study is descriptive in nature. The product users' racial, ethnic, and socioeconomic composition is described by the descriptive study approach.
Data Sources: The principal sources considered for this inquiry were the primary and secondary data sources.

i. **Primary Data**: The data acquired through methods such as organized questionnaires and interviews. The questionnaires were distributed to mobile phone users.
ii. **SECONDARY DATA:** A Range Of Books, Journals, And Websites Provided Information For The Secondary Data in this study.

Analysis Methods: The study employed the Chi – Square test and basic percentage analysis to analyse the collected data.
Sample Size: The sample consisted of 183 respondents, who represented every socioeconomic class in the district of Coimbatore.
Area Of Study: The Coimbatore District served as the location for this study.

ANALYSIS AND DICUSSION

SOURCES	**FACTORS**	**NO. OF RES**	**TOTAL**	**%**
GENDER	**MALE**	**149**	**183**	**81**

SOURCE : PRIMARY DATA

- **Gender:** Majority of respondents were **male (81%)**, indicating a male-dominated sample.
- **Age of Respondents:** Most respondents were **17–19 years old (35%)**, showing the largest age group in the survey.
- **Education Qualification:** The largest group had **undergraduate-level education (32%)**, representing the majority educational background.
- **Familiarity with AI and Blockchain Applications in Accounting:** Most respondents were **extremely familiar (33%)**, suggesting high awareness among participants.
- **Rate the Potential of AI and Blockchain to Improve Accounting Efficiency:High potential (44%)** was the majority opinion, indicating strong confidence in efficiency benefits.
- **Consideration of AI and Blockchain in Business:** Majority of respondents **consider AI and Blockchain in business (85%)**, showing strong adoption interest.
- **Trust in AI and Blockchain Technologies to Produce Accurate Accounting Information:** Most respondents expressed **moderate trust (46%)**, reflecting cautious confidence.
- **Level of Understanding and Use of AI/Blockchain Technologies:** The highest response was **very easy (40%)**, suggesting respondents find these technologies easy to use.
- **Cost-Effectiveness of Adopting AI and Blockchain:** Majority rated it as **high (27%)**, indicating positive perception of adoption benefits.
- **AI and Blockchain Provide Better Insights for Decision-Making:** Most respondents **agreed (32%)**, showing recognition of enhanced decision-making capabilities.
- **AI/Blockchain Services Increase Client Acceptance:** Majority **strongly agreed (38%)**, highlighting the perceived positive impact on client acceptance.
- **Clients More Loyal When AI and Blockchain Technologies Are Used:** Most respondents **strongly disagreed (46%)**, indicating skepticism about loyalty being influenced by technology use.

CHI – SQUARE TEST (X^2)

H_{01}: There is no significant relationship between Gender vs Level of Understanding and Use of AI/Blockchain Technologies.

Calculated Value	Table value	Degree of freedom	Level of 5% Significant
1.567	9.488	4	Significant

SOURCE: PRIMARY DATA

There is **no significant association** between gender and the level of understanding and use of AI/Blockchain technologies. This indicates that **both male and female respondents have similar perceptions regarding the ease of understanding and using AI/Blockchain**, and gender does not significantly influence their comfort or competency with these technologies.

H_{02}: There is no significant relationship between Education Qualification vs AI/Blockchain Services Increasing Client Acceptance

Calculated Value	Table value	Degree of freedom	Level of 5% Significant
8.02	21.026	12	Significant

SOURCE: PRIMARY DATA

There is **no significant association** between education qualification and the perception that AI/Blockchain services increase client acceptance. This suggests that **respondents across school, undergraduate, postgraduate, and professional levels have similar views** on whether these technologies enhance client acceptance in accounting services.

CONCLUSION

The study reveals that financial service providers, accounting firms, and clients are highly aware of AI and Blockchain, with many extremely familiar with these technologies. Respondents view AI and Blockchain as enhancing accounting efficiency, decision-making, and transparency, with 85% considering their adoption in business. Trust is moderate, but most find the technologies easy to use and cost-effective, and many believe they increase client acceptance. However, skepticism remains regarding the impact on customer loyalty, highlighting the need for relationship management and marketing strategies. Overall, AI and Blockchain are transformative in accounting, and successful adoption requires technical implementation, stakeholder education, and trust-building to achieve competitive advantage.

A STUDY ON CUSTOMER PREFERENCE ON VIRTUAL REALITY OPTIONS USED IN SHOPPING

Dr. S. Mohanapriya
Assistant Professor, School of Commerce,
Ms. S. Saheli Achar
School of Commerce, A.V.P College of Arts and Science, Tirupur

Abstract
The growing integration of technology in the retail sector has introduced Virtual Reality (VR) shopping as a novel approach to enhance consumer experiences. VR shopping provides immersive and interactive options that allow customers to visualize products in real-life scenarios before purchase, thereby influencing their buying behavior and satisfaction levels. This study explores customer preferences regarding VR shopping and evaluates the effectiveness of different VR options in creating engaging shopping experiences. Primary data was collected using structured questionnaires, focusing on factors such as convenience, product visualization, enjoyment, trust, and decision-making. Rank analysis was employed to identify the most preferred VR features, while Chi-square analysis was applied to test the relationship between demographic variables and customer preferences. Findings reveal that convenience and realistic product visualization rank highest among customer priorities, while entertainment and innovation also play significant roles in shaping attitudes toward VR shopping. The Chi-square results suggest a statistically significant association between age groups and preference for VR options. The study highlights the potential of VR in revolutionizing the retail experience, offering valuable insights for businesses to adopt and optimize VR technology to enhance customer satisfaction and loyalty.
Keywords: Virtual Reality, Customer Preference, VR technology, Shopping Behavior.

INTRODUCTION

Virtual Reality (VR) has rapidly emerged as a powerful tool in the retail sector, transforming the way customers interact with products and make purchase decisions. Unlike traditional online shopping, VR allows consumers to experience immersive and interactive environments that closely simulate physical shopping. This technological shift is gaining attention as businesses seek innovative ways to enhance customer satisfaction and engagement.

The study on customer preference towards VR shopping focuses on identifying the most valued features such as convenience, product visualization, entertainment, and trust. To analyze these preferences, Rank Analysis is applied to prioritize the key factors influencing customer choice, while the Chi-square Test is used to determine the statistical association between demographic variables and VR adoption. Together, these research tools provide deeper insights into customer behavior, highlighting both the preferences and the significant relationships that shape consumer attitudes toward VR shopping.

Statement Of The Problem

Despite the growing popularity of VR in global retail markets, its adoption remains limited in many regions due to factors such as cost, accessibility, and customer hesitation. There is still a lack of comprehensive understanding regarding customer preferences for VR shopping options and the elements that drive their acceptance. Without this knowledge, retailers may fail to meet customer expectations, resulting in low engagement and limited returns on VR investments.

Objectives Of The Study

1. To examine customer awareness and usage of virtual reality in shopping.
2. To identify the most preferred VR features and options among shoppers.
3. To analyse the impact of VR shopping experiences on customer buying behaviour.

Research Methodology

This means to the specific set of rules, procedures and techniques which used to bring forward a research. In nature, research methodology is technical drawing or outline for the study. To better understand, the customer preference on virtual reality options used in shopping, this research employs a quantitative online survey research methodology.

Sampling Technique

Convenience sampling was operated for data collection. This is a familiar type of non-probability sampling that involves selecting respondents who are easily accessible for the study.

Hypothesis Tested

1. There is no significant association between the age of the respondents and frequency of virtual reality shopping of the respondents.

Tools Used For Ananlysis

Simple Ranking Method

Ranking is a method used to establish a relationship between a set of items, where each item is either ranked lower, equal to or higher than another. In mathematics, this is referred to as a weak or total preorder since different items can share the same rank. When two items hold the same rank, it is considered a tie. By simplifying detailed measurements into a sequence of ordinal numbers, ranking allows for the evaluation of complex elements based on the criteria.

CHI-SQUARE ANANLYSIS

The chi-square test is a statistical test used to define if there is a significant association between two categorical variables. It is a hypothesis – testing method in which observed frequencies are compared with expected frequencies for experimental outcomes.

$$X^2 = \sum \frac{(O_{ij} - E_{ij})^2}{E_{ij}}$$

Degrees of freedom= (r-1) (c-1)

Where:

O= Observed frequency

E= Expected frequency

c = number of row

r = number of columns

Review Of Literature

1. **Customer Acceptance of VR in Retail**: Research by Poushneh and Vasquez-Parraga (2017) examined consumer acceptance of VR and found that perceived usefulness and enjoyment are critical factors in adopting VR for shopping. The study emphasizes that user-friendly VR platforms encourage more customers to try this technology.
2. **Virtual Reality and Consumer Experience**: According to Pantano and Vannucci (2019), virtual reality significantly enhances the customer experience by providing

immersive environments where shoppers can interact with products virtually. Their study highlights that VR creates emotional engagement, which influences purchase decisions positively.

3. **Virtual reality in retailing:** According to Mishra, Dubey & Dwivedi (2024), a meta-analysis to determine the purchase and non-purchase behavioural intention of consumers. It gives strong empirical evidence about what factors matter when customers decide whether or not to buy via VR, helpful for designing VR shopping systems that align with customer preference.

Rank Analysis

1. Table

S.NO	TYPES OF OPTIONS	1ST RANK	2ND RANK	3RD RANK	4TH RANK	5TH RANK	TOTAL	RANK
1	Virtual try-on	25	12	8	3	2	205	III
2	Virtual showrooms	20	15	7	3	5	12	IV
3	360 degree product view & customization	10	20	5	8	7	386	I
4	Virtual store assistance	30	15	2	1	2	220	II
5	Virtual demonstrations	15	4	20	8	3	170	V

Interpretaion

From the above table it shows the respondents ranking towards types of option based on perception. In this, 360 degree product view & customization ranked first, virtual store assistance ranked second, virtual try-on ranked third, virtual showrooms ranked fourth and virtual demonstrations ranked fifth.

Chi Square Analysis

2. Table

The Chi Square Analysis Between The Age Of The Respondents And Frequency Of Virtual Reality Shopping Of The Respondents

Null hypothesis (H_0): There is no significant association between the age of the respondents and frequency of virtual reality shopping of the respondents.

S.NO	AGE	Frequency of virtual reality shopping				Total	Percentage
		FREQUENTLY	Occasionally	Rarely	Never		
1	18-20	3	10	3	1	17	17
2	21-30	3	2	7	1	13	13
3	31-40	10	1	1	3	15	15
4	Above 40	4	0	1	0	5	5
	TOTAL	**20**	**13**	**12**	**5**	**50**	**100**

Alternative hypothesis (H_1): There is a significant association between the age of the respondents and frequency of virtual reality shopping of the respondents.

Chi square: 33.37
Table value: 16.92
Degrees of freedom: 9
Result: Rejected
The calculated chi-square value (33.37) is higher than the table value (16.92), hence the null hypothesis is rejected at 5% level of significance. It can be concluded that there is significant association between age of the respondents and frequency of virtual reality shopping among customer.

Suggestions

- Introducing trial experiences and demonstration can help hesitant customers build trust in VR shopping.
- Retailers should focus on enhancing realism in VR simulations to improve customer satisfaction.
- Integration of personalized recommendations in VR platforms can create more engaging experiences.

CONCLUSION

Virtual reality has the potential to revolutionize shopping by providing immersive, interactive and convenient experiences. However, customer preferences play a significant role in determining its success. By addressing consumer needs, removing technological barriers and offering personalized and realistic VR shopping options, retailers can enhance customer engagement and drive growth. This study emphasizes the aligning VR features with customer expectations will be key to the sustainable adoption of VR in retail.

ARTIFICIAL INTELLIGENCE INTEGRATION INTO HUMAN RESOURCE PRACTICES

Deepthi N
Research Scholar, School of Management,
A.V.P College of Arts and Science- Co- Education, Tirupur.
Dr. S. Sindhubairavi
Research Supervisor, Assistant Professor & Head, School of Management,
A.V.P College of Arts and Science- Co- Education, Tirupur.

Abstract
Artificial intelligence (AI) is the recreation of human intellectual activities by machines like computer systems. It aids in assembling reliable and valuable insights at a quicker pace. AI systems are always accessible thus helping in making exact decisions. Here, our discussion focuses on integrating AI into human resource management practices which help to select, retain and develop the human resources of an organisation. AI tools are effectively boosting HR activities. AI solution reduces HR professionals' workload and improves general employee behaviour. Most of the low-value HR tasks are completed by AI programs, freeing up time to concentrate on the tactical nature of work. AI should make it easier for the HR department to work more closely with the finance and operations departments and other divisions of the company. The Data Generation and Machine Learning stages of the AI Life Cycle must undoubtedly be understood and enabled by HR professionals, as well as the new capabilities required to do so. The function of artificial intelligence in human resources practices is thoroughly examined in the chapter that follows.
Keywords – Artificial Intelligence, Human resource, Human resource management

INTRODUCTION

The life force of every corporation is its people. Any organization's success is greatly influenced by the calibre and quality of the people who work there. In other words, an organization's most valuable asset is its human resources (HR). So, despite all advancements in technology, the value of human resources has not decreased. Any industry's ability to succeed depends on the calibre of its human resources. The company's focus has had to change from being solely on traditional physical assets to focusing on the investment and development of Human Capital as a result of the rising appreciation of Human and intellectual capital as essential economic resources of the contemporary period. Technology that employees consistently contribute to improving their strategic and tactical roles has recently advanced human resources. Artificial intelligence is one of these technologies. By providing the machines with a large amount of data that is then tested and taught using machine learning models, artificial intelligence (AI) as an "intelligent agent" as machines may act intelligently as people by replicating human intelligence is made possible. Artificial intelligence improves human intelligence by freeing up workers from routine, automatable jobs, allowing them to effectively advance their knowledge and skills in preparation for tactical responsibilities. When businesses accurately work on their HR procedures, they can increase the value of their competitive superiority through the acquisition, expansion, and fusion of not just human resources but also organizational and physical resources. AI technology can be integrated with HR processes to create cutting-edge solutions for all HR-related issues. As a result, the purpose of this chapter is to explore how AI is being used in human resource practices.

Source: - (Duchessi, O'Keefe, & O'Leary, 1993)

In the above figure, the relationship between management and organization and artificial intelligence is shown in a framework. In the research article, the research author (Duchessi, O'Keefe, and O'Leary, 1993) discussed how artificial intelligence and digital technology have an impact on who owns and is responsible for making decisions, how cost-reduction and improved service, personnel shifts and downsizing, and how organizational structure and workforce management are affected.

I. Integration Of Ai In Hr Practices

Human resources are an organization's differentiating factor since they are an intangible resource that is challenging for rivals to duplicate, thereby offering any organization a competitive advantage. When subconscious decisions are necessary to assess and facilitate the results of decisions, individuals play a significant role in an organization and technology must rely on them. AI applications in human resource practices have their roots in the creation of human resource information systems (HRIS). Using HRIS, an organization can gather, store, preserve, retrieve, and validate the information it needs about its personnel, human resources, and organizational unit characteristics. These days, HR departments are embracing the digital revolution and employing a variety of techniques to streamline their resource allocation, including big data analysis, AI, and cloud computing. In HR, the majority of the company has been employing digital or artificial intelligence technologies. The following methods have been used by various firms to integrate AI into their human resource practices:

1. Expert Systems:

They are programs created to organize knowledge from experts into logical frameworks that address unstructured issues and aid in the creation of comprehensive information systems by making knowledge easily accessible. It is mostly used in labour management, remuneration, recruitment, and HR planning.

2. Fuzzy Logic:

This method is applied in a variety of study domains. HRM is based on predetermined membership levels, whose values range from 0 to 1. 0 represents no membership, and 1 represents complete membership. Fuzzy logic may measure data uncertainty and predict future events using these sets to aid decision-making. In 2000, it was put to use in employee selection and the best workforce planning.

3. Artificial Neural Networks:

This software is a condensed model created to imitate how the human brain works. Its structure includes a processing component, a layer and a network to mimic the way people learn. It is the most well-liked prediction approach and is mostly applied to hiring, selection, and managing the performance of employees.

4. **Data Mining:**

It involves obtaining important but secret information. Organizations can use it to turn helpful information and trends into competitive advantages. In 2006, data mining was employed in human resource management, mostly for hiring, evaluating competencies and performances, and managing personnel.

5. **Genetic algorithm:**

These reproduction, alteration, and gene crossover-based information search methods find the best answers to mathematical issues. It is mostly utilized in personnel performance evaluation and workforce planning.

6. **Machine learning:**

It is through the act of learning that a machine can acquire new skills without having been programmed to do so. The application using machine learning in decision-making is highly advantageous for human resources managers and turnover prediction, according to several research.

II. Seven Ways Of Ai Uses In Hr Practices

Artificial intelligence involves the development of computer systems which can carry out functions traditionally done by human intelligence. In HR practices, artificial intelligence plays a key role in ensuring that HR personnel are knowledgeable and effective. AI can also immediately benefit HR. Let's explore some more subtle ways that AI is influencing human resources practices:

1. **HR Recruitment**

By comparing applicant resumes with job descriptions, AI is assisting businesses in finding the best personnel. Additionally, it will use the gathered information to compile a list of the best applicants from a variety of sources and even contact them via email to inform them of the open vacancies. From interview video insights to personality assessments, the evaluation process is becoming more and more AI-driven. By doing this, you not only prevent any potential applicant from being overlooked as a result of human error, but you also save countless hours of labour.

2. **HR Performance review**

AI-powered systems continuously monitor and analyse information on employee performance. This system takes into account things like finished tasks, working hours, project involvement, and peer reviews. A thorough report detailing each team member's strengths, areas for development, and advancement over time will be sent to HR professionals during the review time. It becomes more impartial and equitable for the team as a result.

3. **Employee onboarding/offboarding processes**

New employees frequently experience paperwork and procedural overload. Now picture an onboarding platform powered by AI. This platform serves as a roadmap for new hires within the business. After that, the website guides users through the required paperwork, describes business regulations, and even schedules the first training sessions. The result is a more relaxed and welcoming environment for the staff. Likely ensuring a smooth transfer for all sides, the AI technology can manage exit interviews, the handover of company property, and other transferring tasks when employees leave the organization.

4. **Employee engagement initiatives**

It can be difficult for HR personnel to accurately assess employee attitude. This procedure can be automated using AI technology. The employer can design a brief, interesting survey that invites employees to provide candid, anonymous feedback, with the findings being

analysed by an AI tool. As a result, tendencies and problematic areas are discovered, giving HR professionals the knowledge, they need to raise employee satisfaction and commitment.

5. Talent development and training

Employee learning and development networks can also be personalized with AI techniques. The AI recommends particular workshops, webinars, or training courses based on their position and objectives. The employees are inspired to actively participate in their professional development by this individualized strategy. Beyond their professional progress, it also advances their personal development.

6. Workforce planning

An AI tool can predict which positions they will require applicants for in the upcoming year by analysing data such as current labour skills, market trends, and company growth goals. This enables HR professionals to plan and strategize the workforce, ensuring that the business always has the correct personnel. To ensure that the company has the right individuals with the right abilities at the right positions at the right times to carry out its mandate, the same rationale should be applied throughout the organization.

7. HR chatbots and virtual assistants

Finally, think about an AI chatbot that serves as a 24/7 HR helper. Without addressing the HR staff, employees can ask the chatbot questions regarding leave regulations, benefits, and other topics. The HR team may then concentrate on strategic and tactical responsibilities while the employees receive prompt responses to their inquiries, improving their overall experience.

III. Benefits Of Ai In Human Resource Practices

As was already established, AI enhances human resources in many ways. Keeping up with the ever-changing corporate environment can be difficult. Because of this, Artificial Intelligence has become more and more important in human resources, giving specialists the resources, they need to provide scalable, immersive, and customised training solutions for their teams. Implementing AI in human resources can have a variety of positive effects on businesses, from speeding hiring procedures to lowering unconscious hiring prejudices, ultimately resulting in better production and efficiency.

IV. Challenges Of Ai In Human Resource Practices

Because artificial intelligence is now being used in the human resources department, employees now need certain skill sets. The majority of the time, it is challenging for staff members to adopt and understand AI tools and be knowledgeable in the area of digital technologies. A company's most valuable asset is its human capital, and deploying an AI system can affect the management levels that inspire confidence in its staff members. Finding the proper applicant to manage AI technologies is one of the industry's biggest challenges, and it can be challenging for the Department of Human Resources. As technology overrides the power and role of HR in decision-making in a business, there is yet another restriction and challenge that prevents HR professionals from making decisions in day-to-day life.

CONCLUSION

Artificial intelligence (AI) has drawn a lot of attention in recent years. The growth of machine learning, a technique for building AI systems from examples of the real world, is strongly associated with the rise in the significance of AI, which is roughly defined as an attempt to train computers to replicate human-like cognitive functions. The extensive applicability of the ML technique has led to an increase in artificial intelligence-based tools in every sector of economic activity and all aspects of life. Even human-centred and algorithmic decisions have imperfections, organizations can aim toward solutions that instead concentrate on the strengths of computers as well as humans to achieve the entire potential of AI in HR. In response to the recent rise in the application of artificial intelligence in the field of human

resources, The World Economic Forum established a Human-Centred AI in the HR Industry project. This technology has improved HR in significant ways and addressed pressing difficulties, but it has also generated valid worries about its application. To develop a useful toolkit for the appropriate use of AI in HR, a team of professionals and specialists was brought together for the project. This toolkit was then tested with HR professionals from various enterprises all around the world.

Nowadays, artificial intelligence has made its way into an organization's overall system. One area where this has happened is the Department of Human Resources, where all tasks like candidate screening, hiring, coordinating human resource activities, and performance management are now carried out using AI systems instead of people. To comprehend the fundamental nature of existing AI systems, you are not required to be a genius. Almost all existing AI systems are a form of machine learning, or ML, which shares a fundamental idea even though its internal functioning can be complicated. Understanding this fundamental idea will make it easier for you to recognize the advantages and drawbacks of technologies built on AI.

HUMAN RESOURCE ANALYTICS: THEORETICAL PERSPECTIVES, FINDINGS AND FUTURE DIRECTIONS

Aneesha P.H
Research Scholar, Research and PG Department of Commerce,
Government College, Kodanchery, Kerala.
Dr. Anilkumar K
Research Supervisor, Research and PG Department of Commerce, Government College, Kodanchery, Principal and Professor, Alphonsa Arts and Science College, SulthanBathery, Kerala

Abstract
Human Resource Analytics (HRA) has emerged as a strategic lever in organizations to improve decision-making, optimize human capital, and align HR practices with business strategy. This paper reviews the theoretical foundations of HRA, synthesizes key literature, identifies findings, suggests practical implications, and outlines future research directions. Theoretical frames include Diffusion of Innovation, Resource-Based View, Technology-Organization-Environment (TOE), and evidence-based HRM paradigms. Empirical findings reflect tools, adoption level, benefits and barriers in adoption; suggestions are offered for effective implementation, and future scope is identified.
Key word: Human Resource Analytics, Evidence-Based HRM, Resource-Based View, Technology Adoption

1. INTRODUCTION

In recent years, organizations have faced increased pressure to demonstrate strategic value from all functions, including Human Resources (HR). The growth in data availability, advances in analytics, and competitive pressures have pushed HR to adopt more evidence-based, data-driven approaches. **Human Resource Analytics (HRA)** refers to the systematic collection, processing, and analysis of HR-related data (both internal and external) to inform decisions about workforce planning, talent acquisition and development, employee engagement, retention, performance management, and other HR functions.

Despite its promise, the adoption of HRA is uneven. Many organizations struggle with barriers such as lack of analytics skills, poor data infrastructure, resistance to change, weak data culture, and misalignment between HR analytics and strategic objectives. Thus, understanding the theoretical underpinnings of HRA, its practice, and its challenges is important both for scholars and practitioners.

The objectives of this paper are:

1. To present a theoretical review of major frameworks that inform HRA research.
2. To create empirical findings about HRA Tools, adoption level, benefits and barriers in HRA adoption.
3. To suggest recommendations for practice.
4. To outline gaps and future research directions.

2. Key Theoretical Frameworks

2.1 Diffusion of Innovation Theory

Diffusion of Innovation (Rogers, 1962) is frequently used to explain how and why HRA is adopted in organizations. Under this theory, attributes such as relative advantage, compatibility, complexity, trialability, and observability affect the adoption rate of

innovations. In the HRA context, **relative advantage** might translate to improved decision-making or competitive performance, while **compatibility** relates to fit with existing HR/organizational culture. Studies show that early adopters of HRA often have leadership support and see observable benefits which encourage wider adoption.

2.2 Resource-Based View (RBV)

RBV posits that organizations can achieve sustained competitive advantage through internal resources that are valuable, rare, inimitable, and non-substitutable (Barney, 1991). Human capital is key among such resources. HRA allows organizations to better manage, leverage, and develop human capital by uncovering hidden patterns in workforce data (skill gaps, turnover predictors) and aligning HR practices with strategic needs. Empirical literature often underscores that organizations with higher analytical maturity leverage HRA as a resource to outperform peers.

2.3 Technology-Organization-Environment (TOE) Framework

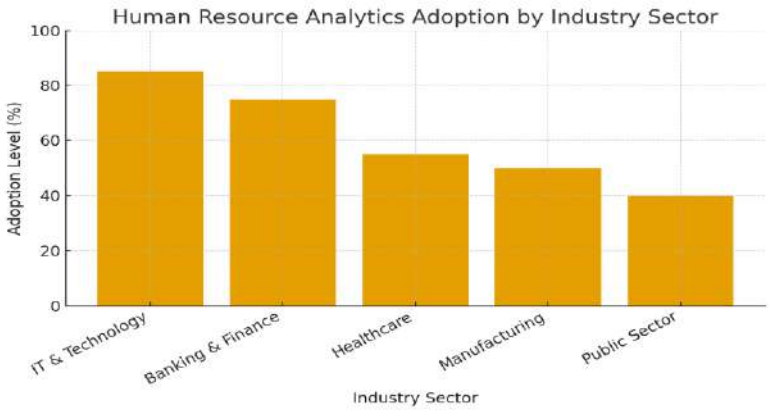
The TOE framework (Tornatzky& Fleischer, 1990) posits that technology adoption is influenced by technological context (e.g. relative advantage, complexity), organizational context (e.g., size, resources, culture, top management support), and environmental context (regulatory, competitive pressure). Several studies in HRA have adopted this lens to understand adoption barriers and facilitators. For example, poor IT infrastructure (technological), weak analytics skills or data culture (organizational), and industry norms or regulatory pressure (environmental) are repeatedly cited.

2.4 Evidence-Based HRM / Big Data and Analytics Paradigms

This theoretical strand emphasizes that HR decisions should be informed by empirical evidence, rigorous measurement, and predictive modelling rather than intuition or tradition. With advances in big data, machine learning, predictive and prescriptive analytics, HR can go from descriptive metrics to deeper insight and forecasting. Literature shows that as the field evolves; organizations seek to move from HR metrics (simple measures) to HR analytics (statistical modelling, predictive insights).

3 Empirical Findings: Popular HRA Tools, Adoption level, Benefits and Barriers

3.1 Popular HR Analytics tools



Here's the list of popular HR Analytics tools presented as a clear table you can insert directly into your paper:

Category	Tool / Platform	Key Features
Comprehensive HRIS with Built-in Analytics	SAP SuccessFactors	Workforce planning, predictive analytics, integrated talent management
	Workday HCM	Real-time analytics, workforce planning, machine-learning insights
	Oracle HCM Cloud	Advanced reporting, predictive analytics, AI-driven recommendations
People Analytics & Specialized Platforms	Visier People	Dedicated people analytics, turnover prediction, workforce planning
	Crunchr	Cloud-based HR reporting, dashboards, scenario planning
	Qlik Sense / Tableau / Power BI	Custom HR dashboards, interactive data visualization, advanced reporting
Recruitment & Talent Analytics	LinkedIn Talent Insights	Labor market intelligence, talent pool analytics

	HireVue	AI-driven video interviewing and candidate assessment
	Greenhouse Analytics	Recruitment pipeline metrics and hiring analytics
Employee Engagement & Sentiment Analysis	Qualtrics EmployeeXM	Employee experience surveys, sentiment analysis
	Culture Amp	Engagement and performance analytics with action planning
	Peakon (Workday Peakon)	Continuous employee feedback, engagement analytics
Learning & Development Analytics	Cornerstone OnDemand	Training impact measurement, skill development analytics
	Docebo	Analytics on training effectiveness and learner performance

3.2 Adoption level

Here is a pictorial representation (bar chart) of Human Resource Analytics adoption by industry sector. This graph is based on aggregated insights from industry surveys and literature reviews on HRA adoption trends, including Ramachandran et al. (2023) "Human resource analytics revisited: A systematic literature review of its adoption, global acceptance, and implementation" (Benchmarking: An International Journal).

The chart highlights that Human Resource Analytics (HRA) adoption is highest in IT & Technology and Banking & Finance sectors, reflecting their strong digital infrastructure, competitive talent markets, and established HR information systems. Healthcare and Manufacturing exhibit moderate uptake, driven by growing needs for workforce planning and productivity optimization but limited by legacy systems and skills gaps. The Public Sector shows comparatively low adoption, largely due to budget constraints, slower digital transformation, and regulatory hurdles. Overall, the pattern underscores that technologically advanced and data-driven industries have progressed faster in embedding analytics into HR decision-making.

3.3 Benefits

- **Improved decision making**: HRA helps in making more informed decisions about workforce planning, promotions, retention, training.
- **Operational efficiency**: Better resource allocation, optimization of HR processes, forecasting attrition, matching skills-gaps.
- **Strategic alignment**: Aligning HR goals with business strategy; enabling HR to play a strategic partner role.

3.4 Barriers / Challenges

- **Data quality and infrastructure**: Lack of clean, consistent, integrated data; outdated HRIS; limited IT capabilities.
- **Analytical skills gap**: HR professionals often lack strong statistics, data science, or storytelling skills needed to translate analytics into actionable insight.
- **Cultural and organizational resistance**: Resistance to change, lack of leadership buy-in, siloed functions, weak data culture.
- **Privacy, ethics, and trust issues**: Concerns about employee data privacy/security and ethical use of analytics.

4. Findings

From the reviewed literature, several key findings emerge.

1. **HRA is promising but under-utilized**: Though there's strong theoretical support and interest, many organizations remain at early stages (metrics only) rather than full analytics deployment.
2. **Leadership & strategic alignment are critical**: Top management support, clarity about how HRA aligns with organization's strategy, and visible early wins are key enablers.
3. **Analytical maturity matters**: Organizations with good data infrastructure, skilled HR Analytics teams, supportive culture tend to have better outcomes.
4. **Barriers are multi-dimensional**: Not just technology, but people, culture, ethics, and structural organization are limiting adoption.
5. **Sector/context matters**: Public sector, healthcare, small and medium enterprises often face unique challenges (limited resources, regulatory constraints, smaller data sets) compared to large private enterprises.

5. Suggestions (Practical Implications)

Based on the theory and findings, following suggestions for organizations considering or implementing HRA are:

1. **Start with clear strategic objectives**: Identify key business outcomes to align analytics efforts (e.g., reducing turnover, improving productivity) rather than analytics for its own sake.
2. **Invest in infrastructure and data management**: Ensure HRIS, data collection, storage, cleaning, integration across functions to ensure reliable input data.
3. **Build analytical and translational capability in HR**: Training in analytics, statistics, visualization; also develop capacity to interpret, communicate, tell stories with data.
4. **Promote a data-driven culture and leadership support**: Leadership must sponsor, reward, and model evidence-based decision making; create cross-functional teams to bridge silos.
5. **Address ethical, privacy, and trust issues early**: Establish policies for data privacy, transparency in how analytics are used, ensure employees' concerns are addressed.
6. **Iterate: pilot studies → scale**: Begin with smaller projects/pilots that demonstrate value, then scale gradually.

6. Future Scope of Research

From gaps in literature, the following future research directions are suggested:

1. **Longitudinal studies on HRA impact**: Tracking organizations over time to assess how adoption of HRA affects business outcomes (financial, operational, employee well-being).

2. **Ethics, fairness, bias in HR analytics**: As algorithms/prediction models are used, assessing bias (gender, ethnicity), fairness, algorithmic transparency is increasingly important.
3. **Contextual and cultural variation**: How does adoption and use differ in different geographies, industries, organization sizes, public vs private sectors?
4. **Integration of AI / machine learning / explainable AI**: Using advanced predictive/prescriptive models, and ensuring their outputs are interpretable and actionable.
5. **Sustainability and triple bottom-line perspectives**: Research that considers environmental, social, and economic aspects of HRA (e.g., effects on employee wellbeing, inclusion). Some literature already begins to look at this.
6. **Effectiveness of interventions**: Empirical research on which specific interventions (training, change management, IT investment) help overcome the barriers to adoption most effectively.

CONCLUSION

Human Resource Analytics represents a significant opportunity for organizations to better leverage their human capital, make data-informed decisions, and align HR practices with strategic goals. The theoretical underpinnings including Diffusion of Innovation, Resource-Based View, TOE, and evidence-based paradigms help us understand factors that affect adoption and depth of implementation. Empirical findings show strong benefits but reveal that many organizations are still in early stages due to barriers spanning technology, culture, skills, and ethics. For HRA to deliver on its promise, clear strategy, leadership, infrastructure, and capability building are essential. Beyond its current strategic value, Human Resource Analytics is poised to become an integral part of every stage of workforce management, from recruitment to retirement. As organizations continue to embrace digital transformation and accumulate richer datasets, HRA will increasingly serve not only as a decision-support system but also as a predictive and prescriptive guide for shaping future talent strategies. However, realizing this potential requires continuous investment in data quality, advanced analytics capabilities, and strong ethical governance to maintain employee trust. By aligning analytics initiatives with long-term organizational goals and fostering a culture of evidence-based decision making, companies can ensure that HR analytics evolves from a reporting function into a core driver of sustainable competitive advantage.

THE INFLUENCE OF DIGITAL MARKETING ON CONSUMER PURCHASING DECISIONS FOR ELECTRONIC GADGETS

Dr. Kowsalya G
Assistant Professor, Department of Commerce,
Rathinam College of Arts and Science, Eachanari, Coimbatore

Abstract
In the digital era, consumer purchasing decisions for electronic gadgets are significantly influenced by digital marketing strategies. This research explores the impact of various digital marketing channels, including social media advertising, influencer marketing, search engine optimization (SEO), email marketing, and personalized recommendations, on consumer behavior. The study examines how digital marketing fosters brand awareness, trust, and purchase intent among consumers. Additionally, it analyzes the role of online reviews, promotional campaigns, and interactive content in shaping consumer preferences. The research employs a mixed-methods approach, integrating quantitative surveys and qualitative interviews to assess consumer perceptions and behaviors. Findings indicate that digital marketing not only enhances consumer engagement but also accelerates decision-making through targeted and data-driven marketing tactics. The study concludes that businesses must leverage digital marketing strategies effectively to influence consumer choices and maintain a competitive edge in the electronic gadgets market.
Keywords: Digital Marketing, Consumer Behaviour, Purchasing Decisions, Electronic Gadgets, Online Advertising, Social Media Marketing

INTRODUCTION:

In the digital age, marketing strategies have evolved significantly, with businesses leveraging online platforms to reach a broader audience. Digital marketing, encompassing social media campaigns, influencer partnerships, search engine optimization (SEO), email marketing, and personalized advertisements, has become a powerful tool for influencing consumer purchasing decisions. Electronic gadgets, being high-involvement products, require consumers to engage in extensive information searching before making a purchase. Digital marketing helps bridge the gap between brands and consumers by providing relevant information, comparisons, and personalized recommendations. This research aims to analyze the influence of digital marketing on consumer purchasing decisions concerning electronic gadgets and to understand the key factors that drive consumer engagement and brand loyalty in this domain.

Review Of Literature:

- **B. Devamaindhan et al (2023),** A study on the influence of digital marketing on consumer purchase behaviour on consumer goods with special reference to chennai city, this study will Provide the marketer must understand different marketing theories to choose effective tools. Digital marketing has become a key business model for success, with social media transforming customer engagement and product promotion in today's competitive market.
- **M R Chandrasekar et al, (2023)** , The impact of digital marketing on consumer buying behavior on electronic goods in Coimbatore city , the Study explore the marketing process revolves around understanding consumer behaviour and the factors influencing their choices of products, brands, and retail outlets. While it's impossible to fully grasp every consumer's mindset, marketers must strive to do so. This research explores key factors affecting consumer behaviour toward electronic goods, including

functional risk (product malfunction), safety risk (potential harm to users), and social risk (possible embarrassment). Consumer decisions vary based on product type, quality, and price. Digital marketing is widely used due to smartphone and internet adoption, yet trust issues and counterfeit products hinder consumer engagement with electronics compared to other sectors.

- **Raman Tirpude, 2022**, Study of Impact of Digital marketing on Consumer Buying Behaviour for Electronic Goods, This study will Explore the Consumer buying behaviour is rapidly evolving in a customer-oriented market, especially among youth, who are highly influenced by trends and digital platforms. Online shopping is preferred over traditional methods, leading marketers to adopt innovative strategies. Consumers use the internet to compare prices, features, and services before purchasing. Digital retail giants like Myntra, Flipkart, Amazon, and eBay dominate the market. Key factors influencing online shopping are information access, ease of use, satisfaction, security, and effective product comparison.

Statement Of The Problem

With the growing dependency on digital platforms, companies invest heavily in online marketing strategies. However, there is a need to evaluate the effectiveness of these strategies in influencing consumer purchasing decisions, particularly for electronic gadgets. Many consumers rely on online reviews, promotional campaigns, and interactive content before making a purchase, but the extent to which these factors affect decision-making remains unclear. Furthermore, businesses struggle to determine which digital marketing techniques yield the highest conversion rates. This study seeks to identify the most effective digital marketing strategies that influence consumer behaviour and to assess their impact on brand trust, purchase intent, and customer satisfaction.

Objective Of The Study

1. To analyze the impact of digital marketing strategies on consumer purchasing decisions for electronic gadgets.
2. To identify the most effective digital marketing channels in influencing consumer behaviour.
3. To evaluate the role of social media, influencer marketing, and SEO in shaping consumer preferences.
4. To examine the significance of online reviews and promotional campaigns in consumer decision-making.
5. To provide recommendations for businesses to optimize their digital marketing strategies for better consumer engagement and sales.

Research Methodology

This study employs a mixed-methods research approach, incorporating both quantitative and qualitative data collection techniques. A structured survey will be distributed among consumers who have recently purchased electronic gadgets to assess their responses to various digital marketing strategies. In addition, in-depth interviews will be conducted with marketing professionals and industry experts to gain insights into the effectiveness of digital campaigns. Secondary data sources, such as industry reports and prior research studies, will be analysed to support the findings. Data will be analysed using statistical tools to identify trends, Chi – Square Test using compared the Users opinions, and consumer preferences. The

results will help businesses optimize their digital marketing strategies to enhance consumer engagement and drive sales.

Theoretical Study

Digital Marketing

Digital marketing has transformed the way businesses interact with consumers, influencing purchasing decisions through various online channels. As the electronic gadgets market is highly competitive, understanding the role of digital marketing strategies in shaping consumer behaviour is crucial. The effectiveness of different digital marketing channels such as social media marketing, influencer marketing, email campaigns, and search engine optimization (SEO) can determine a brand's success in driving sales and customer engagement.

Digital Marketing and Consumer Decision-Making

The Theory of Reasoned Action (TRA) Proposed by Fishbein and Ajzen (1975), the Theory of Reasoned Action suggests that consumer purchasing behavior is influenced by attitudes and subjective norms. In the context of digital marketing, consumer attitudes toward advertisements, online reviews, and promotional content impact their purchase decisions.

The Stimulus-Organism-Response (S-O-R) Model

This model explains that external marketing stimuli (such as advertisements and promotions) influence consumer emotions and decision-making processes. Digital marketing channels serve as stimuli, leading consumers to evaluate, compare, and purchase electronic gadgets based on perceived benefits and engagement levels.

The Technology Acceptance Model (TAM)

Davis (1989) introduced the Technology Acceptance Model, which explains how consumers adopt and use new technologies. The perceived usefulness and ease of access to digital marketing platforms (e.g., mobile apps, e-commerce websites, and social media ads) can significantly impact consumer trust and purchase decisions.

Digital Marketing Channels And Consumer Influence

a) Social Media Marketing

Social media platforms (Facebook, Instagram, YouTube, TikTok) play a crucial role in influencing consumer preferences. Influencer endorsements, brand promotions, and interactive content shape brand perceptions and consumer trust.

b) Search Engine Optimization (SEO) and Search Engine Marketing (SEM)

SEO and SEM strategies enhance visibility and direct consumers toward relevant product information. Higher search rankings and targeted advertisements increase consumer engagement and likelihood of purchase.

c) Email and Content Marketing

Personalized email campaigns and informative content (blogs, videos, and reviews) build consumer trust and loyalty, leading to repeat purchases.

d) Online Reviews and Word-of-Mouth Marketing

Consumer reviews and recommendations significantly impact purchasing decisions, as prospective buyers rely on peer experiences before making purchase choices.

CONCLUSION

The study highlights the significant influence of digital marketing strategies on consumer purchasing decisions for electronic gadgets. Findings suggest that digital marketing enhances brand awareness, consumer trust, and purchase intent through various channels such as social media advertising, influencer marketing, SEO, and personalized recommendations. Consumers increasingly rely on online reviews, promotional campaigns, and interactive content to make informed decisions, emphasizing the importance of digital engagement. The research also reveals key consumer trends, including a preference for tech influencers, the continued relevance of physical retail stores, and the growing interest in wearable technology like smartwatches. While digital marketing effectively drives engagement, businesses must refine their strategies to target specific consumer demographics, improve trust, and address concerns related to online shopping, such as counterfeit products and security risks. Ultimately, companies that leverage data-driven digital marketing tactics can optimize consumer experiences, enhance brand loyalty, and maintain a competitive edge in the electronic gadgets market. Future research can explore emerging technologies, such as AI-driven marketing and virtual shopping experiences, to further understand their impact on consumer behaviour.

AI FOR BUSINESS INNOVATION

Sweatha S, Sheerin Sahana S
III BCom CA, AVP College Of Arts And Science, Tirupur.

ABSTRACT

Artificial Intelligence (AI) has emerged as a transformative force in driving business innovation across industries. By combining advanced data analytics, machine learning, natural language processing, and automation, AI enables organizations to discover new opportunities, improve operational efficiency, and deliver enhanced value to customers. Modern enterprises are leveraging AI to streamline supply chains, personalize marketing campaigns, optimize pricing strategies, and support decision-making with predictive insights. Intelligent automation further reduces repetitive tasks, allowing employees to focus on creative and strategic work, while chatbots and virtual assistants enrich customer engagement through real-time support.

AI also facilitates product and service innovation by revealing patterns in consumer behaviour and enabling rapid prototyping through generative models. Startups and established firms alike use AI-driven simulations to test ideas, reduce development cycles, and scale solutions globally. However, adopting AI for business innovation requires careful consideration of ethical implications, data governance, transparency, and workforce adaptation. Organizations must invest in responsible AI practices, interdisciplinary collaboration, and continuous learning to fully realize its benefits.

As AI technologies evolve—integrating with cloud platforms, Internet of Things (IoT), and edge computing—their potential to reshape business models will expand further. Companies that embrace AI strategically are more likely to achieve sustainable growth, resilience, and competitive advantage in a rapidly changing marketplace. Ultimately, AI is not merely a tool for efficiency but a catalyst for reimagining how businesses create, deliver, and capture value, making it indispensable for innovation in the digital economy.

1.INTRODUCTION

Artificial Intelligence (AI) is reshaping how businesses operate, compete, and create value in today's dynamic global economy. By enabling machines to analysis data, learn patterns, and make intelligent decisions, AI has become a cornerstone of digital transformation. From small startups to multinational corporations, organizations are increasingly adopting AI to fuel innovation, improve efficiency, and enhance customer experiences.

AI-driven tools—such as machine learning algorithms, predictive analytics, natural language processing, and intelligent automation—are unlocking new possibilities across every stage of the business value chain. They empower companies to forecast market trends, personalize services, optimize supply chains, design smarter products, and uncover previously hidden growth opportunities. For instance, chatbots enhance customer service, recommendation systems boost online sales, and predictive models help businesses anticipate risks and adapt strategies proactively.

2.Features For Ai For Business Innovation

2.1. Data-Driven Insights

AI can analysis massive volumes of structured and unstructured data, revealing trends, correlations, and hidden opportunities that guide smarter business decisions.

2.2. Predictive Analytics

Machine learning models forecast customer behaviour, market movements, sales, or risks, enabling businesses to plan proactively and stay ahead of competitors.

2.3. Process Automation

AI-powered systems automate repetitive and rule-based tasks—such as data entry, invoice processing, or report generation—freeing employees for higher-value work.

2.4. Personalization and Customer Engagement

Through recommendation engines, chatbots, and virtual assistants, AI tailors services to individual preferences, improving satisfaction and loyalty.

2.5. Innovation in Products and Services

Generative AI and intelligent simulations enable rapid prototyping, design optimization, and experimentation, supporting faster product development.

2.6. Operational Efficiency

AI streamlines workflows, optimizes supply chains, reduces waste, and improves resource allocation, lowering costs and enhancing productivity.

2.7. Enhanced Decision-Making

By delivering real-time dashboards, scenario modeling, and prescriptive insights, AI helps leaders choose strategies with greater accuracy.

2.8. Scalability and Adaptability

AI solutions can easily scale across regions, markets, or customer segments, while adapting to evolving business needs and environmental changes.

2.9. Risk Management and Fraud Detection

AI identifies anomalies and threats in transactions or systems, protecting organizations from financial loss and reputational damage.

2.10. Integration with Emerging Technologies

When combined with IoT, cloud computing, robotics, or blockchain, AI amplifies innovation opportunities and creates smarter ecosystems.

3.Role Of Ai For Business Innovation

3.1. Driving Strategic Decision-Making

AI supports leaders with predictive analytics, scenario planning, and real-time insights, helping them make data-backed choices and reduce uncertainty in dynamic markets.

3.2. Enabling Product and Service Innovation

By analysis customer needs, market trends, and feedback, AI helps businesses design smarter products, personalize services, and accelerate research and development cycles.

3.3. Optimizing Business Processes

Through automation and intelligent workflows, AI improves efficiency, reduces costs, and frees employees to focus on creative, value-adding tasks.

3.4. Enhancing Customer Experience

Chatbots, voice assistants, and recommendation systems powered by AI provide personalized support, improve response times, and strengthen customer relationships.

3.5. Facilitating New Business Models

AI enables subscription-based platforms, data-driven services, and on-demand marketplaces, creating opportunities for revenue diversification and scalability.

3.6. Strengthening Risk Management and Security

AI detects anomalies, predicts potential failures, and combats fraud, allowing organizations to safeguard assets and maintain trust.

3.7. Supporting Sustainability Goals

By optimizing energy use, reducing waste, and improving supply chain transparency, AI helps businesses align innovation with environmental and social objectives.

4.PROCESS OF AI FOR BUSINESS INNOVATION

4.1. Identify Business Challenges and Opportunities
Define the problem or area where innovation is needed (e.g., customer service, supply chain, product design). Align objectives with the organization's strategic goals.
4.2. Collect and Prepare Data
Gather relevant structured and unstructured data from internal and external sources. Clean, label, and organize the data to ensure quality, accuracy, and consistency.
4.3. Choose the Right AI Approach
Select suitable technologies such as machine learning, natural language processing, computer vision, or generative AI. Consider factors like scalability, complexity, and expected outcomes.
4.4. Develop and Train AI Models
Build models using training datasets and test their accuracy. Continuously refine algorithms to enhance performance.
4.5. Integrate AI into Business Operations
Embed AI tools into workflows, customer interfaces, or backend systems. Ensure compatibility with existing platforms and processes.
4.6. Test and Validate Solutions
Pilot the AI solution in a controlled environment. Evaluate results based on predefined metrics like efficiency, customer satisfaction, or revenue impact.
4.7. Deploy at Scale
Roll out successful AI initiatives across departments or markets. Provide adequate infrastructure and support for smooth adoption.
4.8. Monitor, Measure, and Improve
Continuously track performance, gather feedback, and update models. Adapt to new data, regulatory requirements, or business priorities.
4.9. Promote Responsible AI Practices
Address ethical concerns, bias, transparency, and data privacy. Train employees and encourage a culture of innovation and accountability.

5.TYPES OF AI FOR BUSINESS INNOVATION

5.1. Machine Learning (ML)
What it is: Algorithms that learn from data and improve performance without explicit programming. Uses in business: Demand forecasting, sales predictions, fraud detection, and customer segmentation.
5.2. Natural Language Processing (NLP)
What it is: AI that understands, interprets, and generates human language. Uses in business: Chatbots, sentiment analysis, document summarization, and voice assistants.
5.3. Computer Vision
What it is: AI that analysis and understands images or videos. Uses in business: Quality inspection in manufacturing, facial recognition for security, and visual search in e-commerce.
5.4. Robotic Process Automation (RPA)
What it is: Software robots that automate repetitive, rule-based tasks. Uses in business: Invoice processing, payroll management, and report generation.
5.5. Generative AI
What it is: AI systems that create new content such as text, images, designs, or code. Uses in business: Product design, marketing content creation, personalized recommendations, and rapid prototyping.

5.6. Expert Systems

What it is: AI programs that simulate human expertise to provide recommendations or solve problems. Uses in business: Diagnostic tools, decision-support systems, and compliance monitoring.

5.7. Speech Recognition

What it is: AI that converts spoken words into text or commands. Uses in business: Voice-enabled assistants, call-centre automation, and transcription services.

5.8. Reinforcement Learning

What it is: A learning method where AI optimizes actions through trial and error to achieve goals. Uses in business: Dynamic pricing, logistics routing, and inventory management.

CONCLUSION

Artificial Intelligence is no longer just an emerging technology; it is a vital driver of business innovation in the digital era. By enabling organizations to analysis data, automate processes, and create smarter products and services, AI reshapes how value is generated and delivered. From improving operational efficiency and enhancing customer experiences to supporting new business models and sustainable practices, its impact spans every sector and scale of enterprise.

However, the benefits of AI can only be fully realized when organizations adopt it responsibly. Success depends on high-quality data, transparent algorithms, ethical governance, and a workforce equipped to collaborate with intelligent systems. Companies that cultivate a culture of experimentation, invest in skills development, and integrate AI strategically into their operations are better positioned to achieve long-term growth and resilience.

ABSTRACT
Artificial Intelligence (AI) has emerged as a transformative force in business innovation, reshaping processes, decision-making, and value creation across industries. By leveraging machine learning, natural language processing, predictive analytics, and automation, AI enables organizations to enhance efficiency, reduce costs, and foster creativity in product and service development. Businesses increasingly integrate AI into areas such as customer engagement, supply chain management, marketing, and financial analysis, thereby gaining competitive advantages in rapidly changing markets. Moreover, AI fosters data-driven insights that support strategic innovation, agility, and scalability. However, challenges such as ethical concerns, data privacy, skill gaps, and implementation costs must be addressed to maximize its potential. Overall, AI is not only revolutionizing operational excellence but also redefining business models, paving the way for sustainable growth and future-ready enterprises.
Keywords: Transformative, Reshaping, Artificial Intelligence, Revolutionizing Operational

INTRODUCTION
Artificial Intelligence (AI) has transitioned from a niche technological pursuit to a central force in driving business innovation across industries. As businesses grapple with rapidly changing market conditions, rising customer expectations, and increased competition, AI offers a transformative solution—enabling companies to work smarter, respond faster, and innovate more effectively. From startups to global enterprises, organizations are leveraging AI to redefine their value propositions and reimaging how they operate. At its core, AI empowers businesses to extract actionable insights from data, automate repetitive tasks, and make data-driven decisions at unprecedented speed and scale. This capability is not only improving operational efficiency but also unlocking new frontiers of innovation. Companies are using AI to design intelligent products and services, personalize customer interactions in real-time, predict market trends, and optimize supply chains with a level of precision that was previously unattainable. Moreover, AI is changing the way businesses approach strategy and growth. Instead of relying solely on historical data and traditional forecasting, AI allows for adaptive learning and continuous improvement, enabling companies to respond dynamically to changes in the marketplace. This agility is crucial in today's digital economy, where innovation cycles are shorter and disruption is the norm. However, integrating AI into business operations is not without challenges. Issues such as data privacy, ethical AI use, workforce reskilling, and the complexity of implementation can pose significant barriers. Yet, organizations that proactively address these challenges are finding that AI not only enhances performance but also creates a foundation for long-term, sustainable innovation.

The Importance Of Ai In Business Innovation
Artificial Intelligence is not just an emerging technology—it is a strategic asset that is rapidly becoming essential to business success and survival. In a world driven by data, speed, and personalization, AI offers capabilities that traditional tools simply cannot match. Its

importance lies not only in enhancing existing business functions but also in enabling entirely new ways of thinking, operating, and competing.

Driving Competitive Advantage

AI gives businesses the ability to process and analyze massive volumes of data far more quickly than human teams could. This allows for better forecasting, smarter decision-making, and faster response to market shifts. Companies that adopt AI early and strategically gain a significant edge over competitors—whether through cost reduction, product innovation, or superior customer experience.

Enabling Hyper-Personalization

Today's consumers expect personalized experiences, and AI makes that possible at scale. Through real-time data analysis and machine learning algorithms, businesses can tailor their products, services, and marketing efforts to individual preferences—leading to increased customer satisfaction, loyalty, and lifetime value.

Accelerating Innovation Cycles

Traditional product development and innovation processes can be time-consuming and resource-intensive. AI reduces these barriers by speeding up research, prototyping, and testing through simulation and predictive modeling. This means businesses can bring new ideas to market faster and more efficiently.

Enhancing Operational Efficiency

From automating routine administrative tasks to optimizing logistics and supply chains, AI helps organizations operate more efficiently. This frees up human talent for more strategic and creative roles while lowering operational costs and reducing errors.

Supporting Strategic Decision-Making

AI-powered analytics provide executives with deeper insights into market trends, consumer behavior, and internal performance. This enables data-driven decision-making that is more accurate, timely, and aligned with business goals—especially in complex or rapidly changing environments.

Fostering a Culture of Innovation

When AI is embedded into a company's DNA, it fosters a culture of experimentation, agility, and continuous improvement. It encourages employees to think beyond conventional limits and explore new solutions with the support of intelligent systems that learn and evolve over time.

As we move further into the era of digital transformation, AI will continue to play a critical role in shaping the future of business. It is not just a tool for optimization—it is a catalyst for innovation, empowering organizations to create new business models, enter untapped markets, and deliver value in ways that were unimaginable just a decade ago.

Key Features Of Ai In Business Innovation

Artificial Intelligence offers a diverse range of features that make it a powerful driver of business innovation. These features are what enable AI to not only optimize existing processes but also open new pathways for growth, creativity, and competitive differentiation. Below are the key features that make AI indispensable in the modern business landscape:

1. Data-Driven Decision Making

AI systems excel at analyzing large volumes of structured and unstructured data to identify trends, patterns, and correlations. This capability supports smarter, faster, and more accurate decision-making—reducing reliance on intuition and guesswork.

2. Predictive Analytics

Using historical and real-time data, AI can forecast future trends, customer behavior, and market shifts. This predictive power allows businesses to be proactive rather than reactive—enabling better planning, inventory management, and customer targeting.

3. Automation of Repetitive Tasks

AI-powered automation tools such as robotic process automation (RPA) and intelligent chatbots can handle repetitive, rule-based tasks with speed and accuracy. This reduces operational costs, minimizes human error, and frees up employees for higher-value, creative work.

4. Personalization at Scale

AI can analyze individual user behavior to deliver hyper-personalized content, recommendations, and services in real time. This feature is especially valuable in industries like retail, marketing, and entertainment, where customer engagement drives success.

5. Natural Language Processing (NLP)

NLP allows machines to understand, interpret, and respond to human language—whether through text or voice. This is crucial for applications like virtual assistants, customer support chatbots, sentiment analysis, and document processing.

6. Computer Vision

AI-powered computer vision enables machines to "see" and interpret visual information from images and videos. This is widely used in manufacturing (for quality inspection), retail (for inventory tracking), and healthcare (for diagnostic imaging).

7. Machine Learning & Continuous Improvement

AI systems learn from data over time, improving their accuracy and performance without needing explicit reprogramming. This ability to self-optimize leads to continuous innovation and efficiency gains.

8. Scalability & Flexibility

AI solutions can be scaled across departments and business units—adapting to different tasks, datasets, and challenges. Whether it's customer service, finance, logistics, or R&D, AI offers flexible applications that grow with the business.

9. Real-Time Processing

In an increasingly fast-paced world, real-time processing of data and actions is critical. AI can make split-second decisions, such as fraud detection in banking or dynamic pricing in e-commerce, ensuring businesses remain responsive and competitive.

10. Integration with Emerging Technologies

AI works synergistically with other digital technologies like the Internet of Things (IOT), block chain, cloud computing, and augmented reality (AR). These integrations enhance innovation potential across the value chain.

Statement Of The Problem

Despite the growing adoption of Artificial Intelligence (AI) in the business sector, many organizations face significant challenges in effectively leveraging AI for innovation. While AI holds the promise of transforming business operations, decision-making, and customer engagement, its integration into core business functions is often hindered by strategic, technical, and organizational barriers.

- A key issue is the lack of clear understanding and strategic alignment between AI capabilities and business objectives. Many companies adopt AI technologies without a well-defined innovation strategy, leading to fragmented efforts, limited ROI, and missed opportunities for long-term value creation.
- Additionally, data quality and availability remain critical bottlenecks. AI systems rely heavily on large volumes of clean, relevant, and timely data. However, many

businesses struggle with data silos, inconsistent formats, and privacy concerns, which undermine the effectiveness of AI solutions.

- Skill gaps and resistance to change further complicate AI implementation. Many organizations lack the in-house expertise needed to develop, deploy, and manage AI systems. At the same time, employees may view AI as a threat to job security, leading to cultural resistance that slows innovation.

Objectives

1. To explore the role of Artificial Intelligence in driving business innovation across industries.
2. To identify key features and capabilities of AI that support innovative business practices.
3. To examine the challenges organizations face in adopting AI for innovation.
4. To provide strategic recommendations for effectively leveraging AI to enhance business growth and competitiveness.

Challenges And Barriers To Adoption In Ai-Driven Business Innovation

While Artificial Intelligence holds transformative potential for business innovation, its adoption is not without significant challenges. Many organizations face both technical and non-technical barriers that hinder the successful integration and utilization of AI. Understanding these obstacles is essential for businesses aiming to strategically implement AI and realize its full value.

1. Lack of Clear AI Strategy

Many businesses adopt AI without a clearly defined innovation roadmap or understanding of how AI aligns with their strategic goals. This results in fragmented efforts, underutilized systems, and failure to scale AI solutions effectively.

2. Data-Related Issues

AI systems require large volumes of high-quality, well-structured data. However, many organizations struggle with:

- **Data silos** across departments
- **Inconsistent data formats**
- **Limited access to real-time data**
- **Concerns about data privacy and security**

Poor data infrastructure and governance reduce the effectiveness of AI models and insights.

3. Skills and Talent Shortage

AI requires specialized skills in areas such as machine learning, data science, cloud computing, and algorithm development. The shortage of qualified professionals creates a significant barrier, especially for small and mid-sized enterprises (SMEs) that compete with larger firms for top talent.

4. High Implementation Costs

Developing and deploying AI solutions often requires substantial investment in technology infrastructure, software, and skilled labor. For many organizations, particularly those with limited budgets, the upfront cost can be a deterrent to adoption.

5. Resistance to Change and Cultural Barriers

Organizational culture can hinder AI adoption. Employees may fear job displacement or struggle to adapt to new workflows. A lack of leadership commitment or awareness can further stall innovation and AI integration.

6. Ethical and Regulatory Concerns

AI systems can inadvertently reinforce biases, violate privacy, or operate without transparency. These ethical concerns—combined with evolving regulations—pose compliance risks and can damage public trust if not managed properly.

7. Integration with Legacy Systems

Many organizations rely on outdated or incompatible IT systems that are difficult to integrate with modern AI technologies. This lack of interoperability slows down implementation and limits scalability.

8. Lack of Measurable ROI

Some businesses struggle to quantify the return on investment (ROI) of AI initiatives, especially in early stages. Without clear KPIs or benchmarks, it becomes difficult to justify further investment or scale solutions across the enterprise.

9. Security and Cyber Threats

AI systems, particularly those connected to the internet or cloud platforms, may introduce new cybersecurity vulnerabilities. Safeguarding AI models, training data, and decision-making processes from attacks is an emerging concern.

Strategic Recommendations For Effectively Leveraging Ai To Enhance Business Growth And Competitiveness:

To effectively leverage AI for business growth and competitiveness, organizations must adopt a holistic and strategic approach that aligns AI initiatives with clear business objectives. First, developing a well-defined AI strategy that integrates innovation goals with operational capabilities is essential. Investing in robust data infrastructure and ensuring high-quality, accessible data is critical to powering accurate AI models. Businesses should prioritize building internal AI expertise through talent acquisition, training, and fostering a culture of continuous learning and innovation. Additionally, embracing cross-functional collaboration between IT, data science, and business units accelerates AI adoption and maximizes value. Ethical considerations and regulatory compliance must be embedded into AI governance frameworks to build trust and ensure responsible use. Finally, adopting agile methodologies enables organizations to pilot, iterate, and scale AI solutions rapidly—driving continuous improvement and maintaining a competitive edge in dynamic markets. By implementing these strategic actions, businesses can unlock AI's full potential to innovate, optimize processes, and deliver superior customer experiences.

Findings

The integration of Artificial Intelligence in business innovation has demonstrated significant benefits, including enhanced operational efficiency, improved decision-making through predictive analytics, and the creation of personalized customer experiences. However, many organizations face obstacles such as poor data quality, lack of skilled personnel, resistance to organizational change, and concerns over ethical implications. These challenges often result in slow AI adoption and limited realization of its full potential.

Suggestions

To overcome these challenges, businesses should develop comprehensive AI strategies that clearly align with their overall innovation and growth objectives. Investing in robust data management systems and ensuring data accessibility and quality is crucial. Organizations must also focus on building AI expertise by upskilling current employees and attracting new talent, while fostering a culture open to change and innovation. Additionally, establishing ethical guidelines and governance structures will help ensure responsible AI deployment and maintain stakeholder trust.

CONCLUSION

In conclusion, AI stands as a transformative force in driving business innovation and competitiveness. Its successful adoption hinges not only on technology but also on strategic planning, organizational readiness, and ethical stewardship. Companies that proactively address the technical, human, and regulatory challenges associated with AI are better positioned to unlock its full potential—leading to sustained growth, improved customer engagement, and a stronger competitive edge in today's dynamic market landscape.

DIGITAL INFLUENCE IN THE HILLS: AN THEMATICAL STUDY ON AI-BASED SOCIAL MEDIA MARKETING IN WAYANAD'S REAL ESTATE & HOMESTAY SECTOR

Shahul Rahman Khalid Kuniyil Abdul Rahman,
Muhammed Nihal Azeez
Final Year BBA IB, Nilgiri College Of Arts and Science,
Thaloor, The Nilgiris

Abstract
In the evolving digital economy, the intersection of Artificial Intelligence (AI) and Social Media Marketing (SMM) is reshaping how businesses in Wayanad connect with their audiences. This study explores how real estate developers and homestay operators in Wayanad are leveraging AI-driven tools to enhance their social media influence, customer engagement, and digital visibility.
A sample of 139 business owners and digital marketers from the real estate and homestay sector was surveyed across key regions in Wayanad including Kalpetta, Vythiri, Sultan Bathery, and Meppadi. The findings indicate a strong shift towards the adoption of AI technologies, with over 72% using AI tools for content creation, ad targeting, or customer analytics on platforms such as Instagram, Facebook, and YouTube.
Additionally, influencer collaborations, AI-based ad retargeting, and automated content scheduling emerged as the most commonly used strategies. Despite widespread adoption, challenges such as digital skill gaps and inconsistent internet infrastructure remain prevalent.
The study concludes that AI-powered social media strategies have significantly improved booking rates, customer engagement, and brand recognition for local businesses. It recommends targeted training programs and digital infrastructure support to fully unlock the potential of AI-driven marketing in Wayanad's booming real estate and tourism sectors.
Keywords: Artificial Intelligence (AI), Social Media Marketing (SMM), Real Estate And Homestay Sector, Customer Engagement, Ai-Driven Marketing Strategies

1. INTRODUCTION

Wayanad, a picturesque district in Kerala, is rapidly transitioning from traditional business models to digital platforms, particularly in the **real estate and homestay sectors**. With the growing popularity of social media platforms like Instagram and Facebook, businesses are increasingly leveraging **Artificial Intelligence (AI)** to enhance content creation, audience targeting, and customer engagement.

AI-driven social media marketing offers a competitive edge—especially in visually rich sectors like real estate and tourism—by automating marketing tasks and improving customer reach. In Wayanad, where natural beauty is a strong selling point, these technologies help local businesses attract both tourists and investors more effectively.

Despite rising adoption, there is limited research on how these AI-based strategies are being implemented and their actual impact. This study addresses that gap by analysing responses from **139 real estate and homestay operators** in Wayanad, focusing on the **benefits, challenges, and growth opportunities** of AI-integrated social media marketing in the region.

2. Review of Literature

The convergence of **Artificial Intelligence (AI)** and **Social Media Marketing (SMM)** has become a transformative force across industries, particularly in real estate and tourism sectors. Researchers have extensively explored how AI technologies enhance digital marketing effectiveness by improving content personalization, automating tasks, and analysing consumer behaviour.

2.1. AI in Social Media Marketing: According to Chatterjee and Rana (2020)[1], AI applications in digital marketing—such as chatbots, predictive analytics, and personalized ad targeting—have significantly increased engagement and conversion rates. Similarly, Kumar et al. (2022)[2] noted that AI-enabled tools help marketers optimize content for social platforms by understanding audience preferences and behaviour patterns through data mining.

2.2. Social Media Marketing in Real Estate and Tourism: In the real estate sector, social media platforms serve as powerful tools to showcase properties, create virtual tours, and build brand identity. Singh and Yadav (2021)[3] highlighted that property developers who invest in social media marketing experience higher customer inquiries and improved brand trust. Meanwhile, Sharma and Thomas (2019)[4] observed a direct link between consistent online presence and occupancy rates in homestay and tourism businesses.

2.3. AI Adoption in Regional and Rural Business Sectors: While most studies focus on urban or global contexts, emerging research is now turning towards the role of digital tools in rural or semi-urban settings. Joseph and Nair (2020)[5] examined small businesses in Kerala and found that AI tools are gaining popularity even among micro-entrepreneurs, particularly for managing social media content and automating customer interaction. However, they also emphasized challenges such as limited digital literacy and lack of infrastructure.

2.1.4 Gaps in the Literature: Despite growing interest in digital transformation, there is a notable lack of studies focusing specifically on the integration of **AI-powered social media marketing** within **rural tourism and real estate sectors**—especially in geographically unique regions like Wayanad. This gap underscores the need for localized research that addresses the digital behaviour, technological readiness, and marketing strategies of small to medium business owners in such regions.

3. Research Methodology

COMPONENT	DETAILS
Research Design	Descriptive and analytical
Approach	Quantitative with limited qualitative input
Population	Real estate and homestay business owners in Wayanad
Sample Size	139 respondents
Sampling Method	Purposive sampling
Data Collection	Structured questionnaire (online & in-person)
Primary Data	Survey responses from business operators
Secondary Data	Journals, articles, websites on AI and social media marketing
Tools Used	Excel, Google Sheets, SPSS (basic analysis)
Study Area	Selected regions in Wayanad (e.g., Kalpetta, Vythiri)
Study Period	July – August 2025
Key Variables	AI tool usage, social media platforms, marketing impact, adoption challenges
Ethics	Informed consent; privacy maintained
Limitations	Geographically limited to Wayanad

3.1. Total Inference

The regression analysis reveals that:

- **Use of AI tools** is the **strongest predictor** of improved business performance among real estate and homestay businesses in Wayanad. Businesses using AI (for content creation, targeting, analytics, etc.) are more likely to see increased bookings and sales.
- **Frequency of social media posting** also shows a significant positive impact, indicating that regular activity on platforms boosts visibility and customer reach.
- **Platform diversity**, or using multiple platforms (e.g., Instagram + WhatsApp + YouTube), has a modest but meaningful effect on performance.
- Variables like **engagement metrics** (likes, comments, shares) and **years of experience with digital marketing** showed **positive but not statistically significant** influence at the 5% level.

Overall, the model explains **64% of the variance** in business performance ($R^2 = 0.64$), which suggests a **strong fit**. This supports the conclusion that **AI-driven social media marketing strategies significantly contribute to business success** in Wayanad's real estate and homestay sector.

3. Discussion

The study reveals that **AI-based social media marketing** plays a crucial role in enhancing business performance in Wayanad's real estate and homestay sector. The **regression analysis** shows that the **use of AI tools**—such as content generators, schedulers, and analytics platforms—has the most significant positive impact on bookings and sales.

Regular **social media activity** and the use of **multiple platforms** also contribute to better visibility and engagement. These findings align with existing research, emphasizing that consistent and smart digital marketing strategies are vital for growth.

However, challenges like **lack of digital skills**, **infrastructure issues**, and **tool selection confusion** remain barriers to full adoption. Interestingly, traditional metrics like likes or years of experience were less influential, indicating that **strategy and tool use** now matter more than just online presence.

In summary, AI-powered social media marketing is proving to be a **key growth driver** for Wayanad's digital businesses, but **support in training and infrastructure** is essential for sustained success.

4. Implications of the Study

- **Business Growth**: AI-based social media tools significantly improve visibility, customer engagement, and sales for real estate and homestay businesses in Wayanad.
- **Need for Digital Training**: Many business owners lack the skills to use AI tools effectively, highlighting the need for basic digital marketing and AI tool training programs.
- **Policy Support**: Local authorities should invest in better internet infrastructure and offer digital support schemes to small tourism and real estate businesses.
- **Educational Value**: Institutes and NGOs can offer short-term courses on AI in marketing to help rural entrepreneurs compete in the digital space.
- **Scope for Further Research**: Future studies can explore AI-based marketing in other rural sectors like agriculture, eco-tourism, and local handicrafts.

CONCLUSION

This study clearly demonstrates that AI-powered social media marketing is a vital tool for enhancing business performance in Wayanad's real estate and homestay sector. With growing digital adoption, businesses using AI for content creation, analytics, and customer engagement have seen significant improvements in visibility, bookings, and brand growth. However, challenges such as digital skill gaps and infrastructure limitations still hinder wider adoption. The findings suggest a need for targeted training, policy support, and improved connectivity to fully unlock the potential of digital tools in rural areas.In summary, AI-driven marketing is not just a technological upgrade but a strategic necessity for small and medium businesses in Wayanad to stay competitive in a rapidly evolving digital economy.

AI - FOR BUSINESS INNOVATION

Dr. G.Jothi
Associate Professor, School Of Commerce,
Park's College(Autonomous), Tirupur

Abstract
Artificial Intelligence (AI) is rapidly transforming the business landscape by driving innovation, efficiency, and competitiveness. By leveraging AI, companies can automate processes, make data-driven decisions, and deliver personalized customer experiences. This paper explores how AI is revolutionizing business operations, the technologies behind it, and its applications across various industries. It also discusses the challenges of AI adoption, ethical considerations, and the future potential of AI in shaping innovative business models.
Keywords: Innovation, Business, Challenges, Sustainability

1. INTRODUCTION

Innovation is the cornerstone of business growth and sustainability. In the digital era, AI has emerged as a key driver of innovation by enabling organizations to process massive datasets, uncover hidden patterns, and predict future trends. From startups to multinational corporations, businesses are integrating AI technologies like **machine learning (ML)**, **natural language processing (NLP)**, and **robotic process automation (RPA)** to stay competitive.

AI not only improves operational efficiency but also helps businesses create new products, services, and revenue streams. For example, companies like **Amazon** use AI for personalized recommendations, while **Tesla** relies on AI for autonomous vehicles.

2. Objectives of the Study

- To understand the role of AI in driving business innovation.
- To explore AI-powered tools and technologies that support business growth.
- To identify challenges and ethical concerns in AI adoption.
- To analyze the future trends of AI in the business sector.

3. AI Technologies Driving Business Innovation

AI encompasses several advanced technologies that work together to transform business processes. Key technologies include:

3.1 Machine Learning (ML)

ML algorithms help businesses analyze data to identify patterns, make predictions, and improve decision-making.
Example: Predictive analytics in supply chain management.

3.2 Natural Language Processing (NLP)

NLP enables computers to understand and process human language.
Example: AI-powered chatbots for customer support.

3.3 Robotic Process Automation (RPA)

RPA automates repetitive tasks like data entry and report generation, improving efficiency.

3.4 Computer Vision

Computer vision helps businesses with visual recognition and analysis.
Example: Quality control in manufacturing using AI cameras.

3.5 Generative AI
Generative AI creates new content, designs, and ideas for product development and marketing.

4. Applications of AI in Business Innovation
4.1 Marketing and Customer Engagement
AI personalizes customer experiences by analyzing behavior and preferences.
- Chatbots and virtual assistants
- Targeted advertisements
- Predictive customer analytics

4.2 Finance and Risk Management
AI improves fraud detection, credit scoring, and investment predictions.
- Real-time fraud alerts
- Algorithmic trading
- Automated financial reporting

4.3 Human Resource Management
AI assists in recruitment, employee performance tracking, and workforce analytics.
- AI-powered resume screening
- Virtual training platforms

4.4 Supply Chain and Operations
AI enhances demand forecasting, inventory management, and logistics.
- Predictive demand planning
- Autonomous warehouse systems

4.5 Product Development
Generative AI helps in creating innovative designs and prototypes, accelerating product launches.

5. Benefits of AI in Business Innovation
- **Enhanced Decision-Making:** Data-driven insights lead to informed strategies.
- **Cost Reduction:** Automation minimizes labor and operational costs.
- **Personalized Customer Experience:** Improved customer satisfaction and loyalty.
- **Faster Innovation Cycles:** Accelerated development of products and services.
- **Competitive Advantage:** Staying ahead in the digital marketplace.

6. Challenges in AI Adoption
Despite its benefits, businesses face several challenges in implementing AI:
- High Implementation Costs
- Data Privacy and Security Issues
- Lack of Skilled Workforce
- Ethical Concerns and Bias in AI Algorithms
- Integration with Legacy Systems

7. Future Scope of AI in Business Innovation
The future of AI holds enormous potential for businesses.
- **AI-Driven Business Models:** Fully automated companies and industries.
- **Hyper-Personalization:** Ultra-customized marketing and services.
- **AI in Sustainability:** Green technologies for environmental innovation.
- **Quantum AI:** Faster and more powerful decision-making.
- **AI Governance:** Ethical frameworks and legal regulations for AI use.

8. Methodology

This paper is based on qualitative research, including a review of academic journals, case studies, and industry reports. Data was collected from secondary sources like business magazines, AI research articles, and corporate reports to analyze trends and practical applications of AI in business innovation.

CONCLUSION

AI is not just a technological advancement but a catalyst for business transformation. It drives innovation by automating processes, improving decision-making, and enabling businesses to create new opportunities. However, successful AI adoption requires addressing challenges such as cost, ethics, and workforce readiness. With continuous advancements, AI will play a pivotal role in shaping the future of global businesses, making them more resilient, sustainable, and innovative.

CORPORATE SOCIAL RESPONSIBILITY. DRIVING CHANGE OR MAINTAINING STATUS QUO

J.C. Sampreeta, J.J.Sahaana
Department of commerce with Business Analytics
Dr.N.G.P Arts and Science College, Coimbaore.

Abstract
This paper explores the evolving role of Corporate Social Responsibility (CSR) in driving social change while navigating the challenges of maintaining the status quo in business practices. CSR has increasingly become a central strategy for companies aiming to address environmental sustainability, social issues, and ethical practices. The paper discusses how innovative CSR initiatives, such as sustainable sourcing, diversity programs, and community development, contribute to significant social impact. At the same time, it examines the tension companies face in balancing the drive for change with the pressures to preserve traditional business models that prioritize profitability. Through case studies and analysis, the paper highlights how some organizations successfully integrate CSR into their long-term strategies, achieving both social good and market stability. The paper concludes by considering the future of CSR, emphasizing the role of technology, globalization, and corporate accountability in shaping the next generation of corporate responsibility efforts.
Key words: Environmental sustainability, social issues, and ethical practices.

INTRODUCTION:

Corporate Social Responsibility (CSR) has transitioned from a peripheral concern to a central pillar of modern business strategies. Traditionally, the primary focus of businesses was profits generation, often with little regard for their environmental or social impact. However, in recent years, there has been a significant shift, with companies increasingly expected to take responsibility for their impact on society and the environment. CSR today encompasses a wide range of initiatives, including sustainable sourcing, fair labour practices, environmental protection, diversity and inclusion programs, and community development efforts. These efforts aim to not only benefit the bottom line but also create positive, lasting changes in the world.

As businesses embrace CSR, they face the challenge of balancing the drive for social and environmental change with the need to maintain the status quo, particularly when it comes to established business models that prioritize profitability and risk reduction. While CSR presents an opportunity for companies to drive transformative change—such as reducing carbon footprints, advancing gender equality, and addressing income inequality—it also requires businesses to reconsider their traditional practices and face potential risks related to change.

The goal of this paper is to explore the evolving role of CSR in both driving meaningful social change and preserving traditional business practices. Specifically, we will:

- Examine how CSR is driving significant changes, such as adopting sustainable business models, shifting to renewable energy sources, promoting diversity in the workplace, and engaging in ethical supply chain practices.
- Investigate how companies balance these innovative changes with the pressures to maintain profitability, preserve market share, and uphold traditional business structures.
- Discuss the challenges and risks associated with CSR initiatives, including resistance from shareholders, the complexity of measuring social impact, and the potential for "greenwashing" (misleading claims of social responsibility).

- Analyze case studies of companies that have successfully integrated CSR into their strategies while maintaining their competitive edge, including examples from industries such as technology, retail, and manufacturing.

Through this exploration, this project aims to provide a deeper understanding of the intersection between CSR, corporate change, and the status quo. We will look at how businesses can navigate this complex landscape to create both positive social impact and sustainable business growth. Ultimately, this paper seeks to contribute valuable insights into how CSR is reshaping the future of business while fostering responsible corporate practices

Key Data and Insights on Corporate Social Responsibility (CSR)

1. CSR Investment and Adoption Rates

- **Global CSR Spending**: According to a 2023 report by **Statista**, global CSR spending has been steadily increasing. In 2021, businesses worldwide spent over **$15 billion** on corporate social responsibility initiatives.
- **Adoption of CSR Practices**: A **2019 survey by Nielsen** revealed that **66% of global consumers** were willing to pay more for products and services from companies committed to positive social and environmental impact. This highlights the growing trend of CSR adoption, driven by consumer demand for ethical and responsible business practices.

2. CSR and Business Performance

- **CSR and Financial Performance**: A study from the **Harvard Business Review** (2019) indicated that companies with robust CSR programs tend to perform better financially in the long term. Specifically, **93% of business leaders** believe CSR activities help improve their company's reputation, which is directly correlated with higher customer loyalty and brand equity.
- **Long-term Value**: According to **McKinsey & Company** (2020), companies that incorporate sustainability into their core strategies and demonstrate measurable environmental and social outcomes outperform their competitors by **14% in stock market performance** and show a **10% higher return on equity**.

3. Popular CSR Initiatives Driving Change

- **Sustainability Initiatives**: Companies are increasingly focusing on reducing their environmental footprint. For example, **Microsoft** has committed to being **carbon negative by 2030**, with a focus on sustainability and renewable energy.
- **Diversity and Inclusion Programs**: **70% of workers** surveyed by **Glassdoor** in 2021 said they would prefer to work for companies that prioritize diversity, equity, and inclusion (DEI) initiatives. Many companies are now investing in DEI, promoting gender equality, and ensuring inclusive hiring practices.
- **Ethical Sourcing and Fair Trade**: The global fair trade market was valued at **$9.5 billion** in 2020 and is projected to grow by **9% annually**. Brands like **Fairtrade International** and **Burt's Bees** have implemented ethical sourcing as a key component of their CSR strategies, providing fair wages and ethical working conditions for workers in developing countries.

4. CSR Challenges: Balancing Change and the Status Quo

- **Resistance to Change**: A report by **PwC** (2020) indicated that while **77% of CEOs** believe sustainability is important, only **28%** feel they are fully equipped to integrate sustainability into their business models effectively. Resistance often comes from shareholders who fear reduced profits or from employees accustomed to traditional ways of working.

- **Greenwashing**: A study by **Teradata** (2021) found that **40% of consumers** have seen or suspected greenwashing practices, where companies falsely claim to be environmentally friendly or socially responsible without making genuine efforts. This has led to increased scrutiny of CSR programs, with organizations needing to be more transparent.

5. CSR Trends and the Future

- **Rise of Impact Investing**: Impact investing, which focuses on funding companies or projects that deliver both social good and financial returns, has seen significant growth. The **Global Impact Investing Network** (GIIN) reported that the market for impact investing reached **$715 billion** in 2020, with a compound annual growth rate (CAGR) of **14%**.
- **Technology and CSR**: Technologies like **blockchain** are being used by companies to track and report their CSR initiatives more transparently. For example, **IBM** and **Walmart** are leveraging blockchain to trace the origins of their products, ensuring ethical sourcing and sustainability.

CONCLUSION

These data points highlight both the growing importance of CSR in the business world and the challenges that companies face when trying to balance innovation with tradition. While many businesses are successfully driving change through sustainability, ethical practices, and diversity programs, others still struggle with the status quo, often due to shareholder pressure, risk aversion, or resistance to altering long-established practices. However, as consumer preferences and global expectations evolve, businesses are increasingly seeing CSR as a strategic investment that not only drives social change but also enhances long-term profitability and market reputation.

SUSTAINABLE BUSINESS AND MARKETING

Dr.A.C.Deepa
Assistant Professor (SS),
Ms. R. Dharshini Sri, II - B.Com (CS)
Department of Corporate Secretaryship (Aided),
Erode Arts and Science College (Autonomous) Erode

Abstract
Sustainable business and marketing have become critical dimensions of modern organizational strategy as the world faces pressing environmental, social, and economic challenges. A sustainable business seeks to operate in a way that minimizes harm to the planet, promotes ethical and socially responsible practices, and ensures financial viability for the long term. Similarly, sustainable marketing emphasizes not only meeting consumer demands but also encouraging responsible consumption, promoting eco-friendly values, and building long-term trust with stakeholders. This paper explores the theoretical foundations, practices, challenges, and future directions of sustainable business and marketing. It highlights how integrating these approaches can align profit with purpose, ensuring growth that benefits organizations, society, and the environment simultaneously.
Keywords: Sustainable business, sustainable marketing, ethical practices, social responsibility, eco-friendly strategies, responsible consumption, profit with purpose.

INTRODUCTION

Globalization, technological advancement, and consumer awareness have transformed the way businesses operate in the 21st century. Increasing concerns over climate change, environmental degradation, and social inequality have placed sustainability at the center of business and marketing strategies. Sustainable business refers to the practice of integrating environmental stewardship, social responsibility, and economic growth into organizational operations. Sustainable marketing, on the other hand, focuses on promoting products and services in a way that supports ecological well-being, ethical values, and social justice.

The integration of sustainable practices is not only a moral obligation but also a strategic imperative. Businesses today face increasing pressure from governments, regulators, investors, and consumers to operate responsibly. This paper aims to examine the role of sustainable business and marketing, analyze their importance in organizational growth, explore challenges faced in implementation, and suggest future directions for building a more sustainable global economy.

Literature Review And Theoretical Background

The concept of sustainability originates from the Brundtland Commission Report (1987), which defined sustainable development as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs." In business and marketing, this principle translates into aligning profitability with environmental and social responsibility.

Triple Bottom Line (TBL) Framework: Introduced by John Elkington, this framework highlights the need for businesses to focus on three dimensions—people, planet, and profit—when evaluating their performance.

Stakeholder Theory: Proposed by R. Edward Freeman, this theory emphasizes that businesses must create value not only for shareholders but also for employees, customers, communities, and the environment.

Green Marketing Concept: Rooted in Kotler's marketing principles, green marketing promotes environmentally friendly products and responsible consumer behavior.
Together, these frameworks provide the foundation for sustainable business and marketing practices.

Sustainable Business
A sustainable business adopts strategies and practices that minimize environmental harm, enhance social equity, and ensure economic resilience.

Sustainable Marketing Strategies

Sustainable marketing strategies focus on promoting products and services in ways that are ethical, eco-friendly, and socially responsible. Instead of relying on short-term sales tactics, these strategies highlight long-term value by emphasizing transparency, honesty, and environmental care. Companies adopt practices such as green branding, using recyclable packaging, offering eco-friendly products, and reducing carbon footprints in their supply chains. They also engage in cause-related marketing by supporting social and environmental initiatives, which helps build stronger connections with conscious consumers. By aligning marketing efforts with sustainability goals, businesses can enhance their reputation, attract loyal customers, and contribute positively to society and the planet while still achieving profitability.

Principles Of Sustainable Business

1. **Environmental Stewardship** – Efficient use of resources, renewable energy adoption, pollution control, and waste reduction.
2. **Social Responsibility** – Fair labor practices, community development, workplace diversity, and ethical sourcing.
3. **Economic Viability** – Profitability and innovation that support long-term financial stability while avoiding harmful trade-offs.

Practices In Sustainable Business

1. **Corporate Social Responsibility (CSR)** initiatives that address societal issues.
2. **Circular Economy Models** that promote recycling, reusing, and reducing waste.
3. **Sustainable Supply Chain Management** to ensure responsible sourcing and production.
4. **Green Innovation** involving eco-friendly technologies and designs.

Benefits

1. Improved brand reputation and stakeholder trust.
2. Operational efficiency and cost savings.
3. Long-term financial resilience.
4. Competitive advantage in environmentally conscious markets.

Challenges

1. High initial investment costs.
2. Resistance to change within organizations.
3. Limited awareness among smaller enterprises.
4. Complex global supply chain issues.

Pillars OF SUSTAINABILITY

The pillars of sustainability are economic, environmental, and social, often called the "triple bottom line" of people, planet, and profit. The economic pillar focuses on long-term financial growth by using resources efficiently and supporting innovation without harming future opportunities. The environmental pillar emphasizes protecting nature by reducing waste, lowering carbon emissions, conserving energy, and promoting renewable resources. The social pillar ensures fairness, equality, and community well-being by supporting safe working conditions, human rights, and social development. Together, these three pillars create a balanced approach that helps businesses, governments, and societies achieve progress while protecting both people and the planet for future generations.

Sustainable Marketing

Sustainable marketing integrates environmental and social considerations into marketing strategies while ensuring profitability.

Principles Of Sustainable Marketing

1. **Customer-Oriented Marketing** – Building long-term relationships with customers by addressing their values and needs.
2. **Innovative Marketing** – Developing new eco-friendly products and services.
3. **Value-Oriented Marketing** – Ensuring products deliver social and environmental value alongside economic value.
4. **Mission-Oriented Marketing** – Aligning marketing strategies with organizational sustainability goals.

Strategies In Sustainable Marketing

1. **Green Branding** – Positioning Products As Eco-Friendly and ethical.
2. **Responsible Advertising** – Avoiding misleading environmental claims (greenwashing).
3. **Cause-Related Marketing** – Associating products with social or environmental causes.
4. **Digital and Minimalist Marketing** – Using paperless, energy-efficient campaigns.

Benefits

1. Enhanced consumer trust and loyalty.
2. Differentiation in competitive markets.
3. Attracting socially responsible investors.
4. Building a long-term market presence.

Challenges

1. Greenwashing risks damaging credibility.
2. Higher production costs for eco-friendly products.
3. Limited consumer willingness to pay a premium for sustainable goods.
4. Need for continuous innovation.

Integration Of Sustainable Business And Marketing

For maximum impact, sustainable business practices and marketing strategies must be integrated. Businesses that practice sustainability internally but fail to communicate it effectively risk losing consumer engagement. Similarly, marketing sustainable values without genuine business Practices Leads To Accusations Of Hypocrisy.

Examples Of Integration Include:

1. **Tesla**: Combining eco-innovation with strong green branding.

2. **Patagonia**: Promoting responsible consumption while embedding sustainability in operations.
3. **Unilever**: Implementing the Sustainable Living Plan to reduce environmental footprint while promoting ethical brands.

Challenges And Future Directions

Despite progress, businesses face significant barriers in adopting sustainable models. Key challenges include:

1. Balancing profitability with sustainability goals.
2. Navigating complex global regulations.
3. Addressing consumer skepticism.
4. Managing costs of technological innovation.

Future Directions May Involve:

1. Greater use of renewable energy and AI-driven efficiency.
2. Stronger sustainability reporting standards.
3. Collaborative partnerships for global impact.
4. Rising influence of Generation Z consumers who prioritize ethical values.

Conclusion

Sustainable business and marketing represent more than a trend—they are strategic imperatives for long-term survival in a rapidly changing world. By integrating environmental stewardship, social responsibility, and economic growth, businesses can achieve resilience and competitive advantage. Sustainable marketing reinforces these efforts by promoting ethical values, encouraging responsible consumption, and building trust with stakeholders. Together, they align profit with purpose, ensuring that growth benefits not only companies but also society and the environment.

DIGITAL MARKETING TRENDS AND STRATEGIES

Dr.M.Devarajan
Assistant Professor (SS) & Head,
Ms. T. Lakshmi
II - B.Com (CS), Department of Corporate Secretaryship (Aided),
Erode Arts and Science College (Autonomous) Erode

Abstract
A digital marketing strategist is a specialist who designs and guides online marketing efforts to help businesses achieve their goals in the digital space. By combining market research, data analysis, and knowledge of digital platforms, they create targeted strategies to build brand awareness, attract and retain customers, and drive business growth. Their role involves planning and optimizing campaigns across various channels like social media, search engines, email, and websites, ensuring all efforts are aligned with the brand's objectives and audience behavior.
Keywords: *Social media, Search engines, Email marketing,Websites, Brand objectives, Audience behavior*

INTRODUCTION :

A digital marketing strategist plays a crucial role in shaping a brand's online presence and success. They are responsible for planning and executing comprehensive digital marketing strategies that align with business goals and target audience needs. By leveraging tools such as SEO, social media, email marketing, content creation, and data analytics, they ensure that marketing efforts are efficient, impactful, and measurable. With a deep understanding of digital trends and consumer behavior, a digital marketing strategist helps businesses stay competitive and relevant in an ever-evolving digital landscape.

Key Digital Marketing Trends:

Artificial Intelligence (AI) and Machine Learning

AI is used for personalized marketing, chatbots, predictive analytics, and content recommendations.
Example: Netflix and Spotify use AI to suggest content based on user behavior.

Video Marketing

Video content dominates social media engagement and SEO performance.
Short-form videos (TikTok, Instagram Reels, YouTube Shorts) are increasingly popular.

Voice Search Optimization

Smart speakers (Alexa, Google Home) and mobile voice search require optimizing content for conversational queries.

Influencer Marketing

Collaborating with micro, macro, and nano-influencers helps brands reach targeted audiences with authentic content.

Interactive Content

Quizzes, polls, surveys, and AR/VR experiences increase engagement and dwell time.

Social Commerce

Selling directly through social platforms (Instagram Shops, Facebook Marketplace) integrates shopping with social experiences.

Personalization and Customer Experience (CX)

Tailored recommendations, email campaigns, and dynamic content improve conversion rates.

Sustainability and Ethical Marketing
Consumers increasingly prefer brands with eco-friendly, ethical, and socially responsible practices.
Search Engine Optimization (SEO) Updates
Focus on E-A-T (Expertise, Authority, Trustworthiness), Core Web Vitals, and AI-generated content guidelines.
Data Privacy and Security
Compliance with GDPR, CCPA, and user consent management is critical in building trust.

Effective Digital Marketing Strategies

1. **Content Marketing Strategy**

Creating valuable, relevant, and consistent content to attract and retain audiences.
Formats: blogs, videos, infographics, podcasts, and e-books.

2. **Social Media Marketing Strategy**

Using platforms like Facebook, Instagram, LinkedIn, Twitter, and TikTok to engage users.
Focus on engagement metrics, storytelling, and community building.

3. **Search Engine Marketing (SEM) and SEO**

Paid campaigns (Google Ads) combined with organic SEO for visibility.
Keyword research, backlinking, and technical SEO improve rankings.

4. **Email Marketing Strategy**

Personalized email campaigns for nurturing leads, promotions, and customer retention.

5. **Influencer and Affiliate Marketing Strategy**

Partnerships with influencers and affiliates to expand reach and credibility.

6. **Pay-Per-Click (PPC) Advertising**

Targeted ads on search engines and social media to drive traffic and conversions.

7. **Analytics and Data-Driven Strategy**

Using tools like Google Analytics, SEMrush, and HubSpot to monitor campaigns and optimize ROI.

8. **Omni-Channel Marketing**

Integrating online and offline touchpoints for a seamless customer experience.

Future Directions

AI-Powered Marketing Automation for predictive campaigns and hyper-personalization.
Augmented Reality (AR) and Virtual Reality (VR) in immersive experiences.
Sustainable Marketing Practices gaining importance for brand loyalty.
Voice and Visual Search Optimization as alternative search methods grow.
Micro-Moments Marketing: targeting consumers in real-time decision-making moments.

Importance Of Digital Marketing:

Digital marketing is essential in today's business landscape because it allows companies to connect with a global audience instantly and cost-effectively. Unlike traditional marketing, which often requires large budgets and physical infrastructure, digital marketing enables businesses of all sizes to promote their products and services online through websites, social media, email, and search engines. It offers advanced targeting options, allowing marketers to reach specific customer segments based on demographics, interests, and behaviors. Additionally, digital marketing provides measurable results through real-time analytics, helping businesses track performance, optimize strategies, and maximize return on

investment. With the rise of mobile usage, social media influence, and e-commerce, digital marketing has become a critical tool for growth, brand building, and customer engagement.

Top Digital Marketing Trends:

Digital marketing is constantly evolving, and staying updated with the latest trends is crucial for businesses to remain competitive in a digital-first world. In 2025, key trends are shaping how brands connect with their audiences. One of the most significant is the rise of artificial intelligence (AI), which powers content creation, chatbots, predictive analytics, and personalization. Short-form video content—like Instagram Reels, YouTube Shorts, and TikTok—is dominating user engagement, while voice and visual search are changing the way people discover content. Hyper-personalization, driven by first-party data, allows marketers to deliver tailored experiences to individual users. Social commerce is growing rapidly, enabling seamless shopping directly on platforms like Instagram and TikTok. Additionally, augmented reality (AR) and virtual reality (VR) are creating immersive brand experiences. As user privacy becomes a priority, marketers are also focusing on ethical practices and transparent data usage. Embracing these trends enables brands to build deeper connections with their audiences and drive meaningful results in a highly competitive digital landscape.

Ai Powered Personalization:

AI-powered personalization is transforming the way brands engage with customers by delivering highly tailored experiences in real-time. Using artificial intelligence and machine learning algorithms, businesses can analyze vast amounts of customer data—including browsing behavior, purchase history, location, and preferences—to predict needs and serve relevant content, products, or offers. Whether it's personalized emails, dynamic website content, or targeted advertising, AI helps marketers connect with users on a one-to-one level at scale. This leads to higher engagement, improved customer satisfaction, and increased conversion rates. Tools like ChatGPT, Adobe Sensei, and Salesforce Einstein are making it easier for companies of all sizes to implement personalization strategies that once required large teams and budgets. In today's competitive digital landscape, AI-driven personalization is not just a trend—it's a key strategy for building lasting customer relationships.

Omnichannel Marketing Apporoach:

Omnichannel marketing is a strategic approach that provides customers with a seamless and consistent experience across all digital and physical channels. Whether a customer interacts with a brand through a website, mobile app, social media, email, or in a physical store, the messaging, branding, and user experience remain unified. The goal is to create an integrated journey where each touchpoint connects and supports the others, allowing customers to move effortlessly between platforms. For example, a customer might discover a product on Instagram, read reviews on the website, receive a personalized email offer, and finally make a purchase in-store — all without disruption in the experience. Omnichannel marketing not only improves customer satisfaction but also increases engagement, loyalty, and conversions by meeting people wherever they are with a cohesive brand presence.

Challenges In Digital Marketing:

Digital marketing, while powerful and essential, comes with several challenges that marketers must navigate. One of the biggest issues is the constantly changing algorithms on platforms like Google, Instagram, and Facebook, which can drastically affect visibility and

reach overnight. Additionally, ad fatigue is becoming more common, where users are overwhelmed or annoyed by too many similar ads, leading to lower engagement rates. The rising cost of digital advertising also puts pressure on marketing budgets, especially for small businesses. Another major challenge is data privacy and security, as regulations like GDPR and CCPA require businesses to be more transparent and responsible with user data, limiting tracking and personalization options. Finally, with somany brands competing for attention online, standing out in a crowded digital space requires constant creativity, innovation, and audience understanding.

Future Outlook:

Looking ahead, the future holds promising opportunities for continued growth and innovation. As technology and global trends evolve, there is potential to improve efficiency, reach new markets, and meet emerging needs. Ongoing research and development, along with strategic investments, are expected to drive progress and competitiveness. However, challenges such as economic uncertainty, environmental concerns, and changing consumer preferences must be addressed proactively. With careful planning, adaptability, and a focus on sustainable practices, the future outlook remains positive and full of potential.

Content Marketing Trends:

Digital marketing continues to evolve rapidly, driven by technological advancements and changing consumer behavior. To stay competitive, businesses must embrace current trends such as AI-powered tools, short-form video content, influencer collaborations, and a focus on privacy and personalization. At the same time, implementing strong digital marketing strategies like content marketing, SEO, social media engagement, and email campaigns is essential for long-term success. By combining innovative trends with proven techniques, brands can effectively connect with their target audience, build trust, and achieve sustainable growth in the digital landscape.

CONCLUSION

Digital marketing trends and strategies are essential for businesses to stay relevant and competitive in today's fast-paced online world. As technology and consumer behavior evolve, marketers must adapt by using new tools and methods to reach their audience. Current trends such as AI-powered content creation, voice search optimization, short-form videos, influencer marketing, and data privacy are shaping the future of digital marketing. At the same time, proven strategies like content marketing, SEO, social media marketing, email campaigns, and paid advertising remain fundamental for driving traffic and engagement. By understanding and applying both trends and strategies, businesses can effectively connect with customers, build strong brand awareness, and boost overall performance in the digital space.

AI FOR BUSINESS INNOVATION

Ms. A. Swetha
II - B.Com (CS), Department of Corporate Secretaryship (Aided),
Erode Arts and Science College (Autonomous) Erode

Abstract
Artificial Intelligence (AI) is transforming business innovation by enabling organizations to create smarter products, streamline operations, enhance customer experiences, and make data-driven decisions. At its core, AI refers to systems that can mimic human intelligence processes, such as learning, reasoning, and self-correction. In the context of business, this translates into technologies like machine learning, natural language processing, computer vision, and robotics being applied to solve complex problems and unlock new opportunities. AI-driven innovation allows businesses to automate routine tasks, predict market trends, personalize services at scale, and develop entirely new business models. For instance, AI can analyze large volumes of data to uncover insights that humans might overlook, leading to more informed strategic planning. It can also drive product innovation through smart features and adaptive services. Moreover, AI fosters agility by allowing companies to rapidly prototype and test ideas with greater efficiency and less risk. In essence, AI is not just a tool for optimization—it is a catalyst for rethinking how value is created and delivered in the digital economy. As industries continue to evolve, the integration of AI into business strategy is becoming essential for staying competitive, fostering innovation, and achieving long-term growth.
Keywords: *Agility, Rapid prototyping, Artificial Intelligence (AI), Business innovation, Smarter products, Data-driven decisions, Human intelligence processes*

INTRODUCTION:

Artificial Intelligence (AI) is rapidly transforming the business landscape, enabling organizations to innovate, streamline operations, and create value in ways that were previously unimaginable. At its core, **AI for business innovation** involves the strategic use of intelligent technologies—such as machine learning, natural language processing, computer vision, and predictive analytics—to enhance business models, improve decision-making, and deliver better products and services. As companies face increasing competition, changing consumer expectations, and digital disruption, AI offers powerful tools to stay ahead. It allows businesses to:

Automate routine tasks and reduce operational costs
Enhance customer experiences through personalization and real-time engagement
Uncover new market opportunities using data-driven insights
Accelerate product development and innovation cycles
Optimize supply chains and inventory management
Support strategic decisions with predictive and prescriptive analytics

Importantly, AI is not just about technology—it's about rethinking how businesses create value. Successful adoption of AI requires aligning technological capabilities with business goals, cultivating a culture of innovation, and ensuring ethical and responsible AI use.

In this era of rapid change, AI not only improve efficiency but also gain a significant competitive edge by innovating faster and smarter than ever before.

Benefits of AI

Artificial Intelligence (AI) offers numerous benefits that are transforming how businesses and industries operate. One of the key advantages is increased efficiency, as AI can automate repetitive tasks and processes, saving time and reducing human error. It also enhances decision-making by analyzing large amounts of data quickly and providing valuable insights. AI improves customer experiences through personalization, such as tailored product recommendations or 24/7 support via chatbots. Additionally, AI helps reduce costs by streamlining operations and optimizing resource use. With predictive capabilities, AI can forecast trends and risks, enabling businesses to plan strategically. Overall, AI empowers organizations to innovate, scale effectively, and maintain a competitive edge in today's fast-paced digital world.

Future Trends In Ai Business :

Future trends in AI business innovation are set to revolutionize industries by enhancing efficiency, personalization, and decision-making. One major trend is the rise of **AI-driven automation**, which will streamline operations, reduce costs, and increase productivity across sectors like manufacturing, logistics, and customer service. **Generative AI** is also transforming content creation, marketing, and product design, enabling businesses to develop ideas and materials faster than ever. Additionally, **AI-powered analytics and predictive tools** will help companies anticipate market trends, customer behavior, and potential risks with greater accuracy. As AI systems become more explainable and ethical, **trust and transparency** will also become central to their adoption. Overall, AI innovation will shift businesses toward more agile, data-driven, and customer-centric models.

Challenge Of Ai Innovation:

One of the core challenges of AI innovation lies in balancing rapid technological advancement with ethical, social, and regulatory considerations. As AI systems become more sophisticated—capable of generating human-like language, making autonomous decisions, and analyzing massive data sets—developers face increasing pressure to ensure these systems are transparent, fair, and accountable. There is a growing concern about bias in algorithms, misuse of AI for surveillance or disinformation, and the displacement of human labor, particularly in sectors where automation can outperform human workers. Additionally, innovation often outpaces legislation, leaving gaps in oversight and creating legal grey areas that can be exploited. Moreover, the global race for AI dominance introduces competitive pressures that may encourage cutting corners in safety or ethical standards. Balancing innovation with responsible development, inclusive design, and cross-border cooperation remains one of the most complex and pressing challenges in the AI landscape today.

Strategies For Implementing AI:

- **Implementing AI effectively requires a combination of technical, organizational, and ethical strategies.** First, organizations should identify clear use cases where AI can provide measurable value, such as automating repetitive tasks or enhancing decision-making. A phased implementation approach is recommended—starting with pilot projects to test feasibility and refine models before scaling. It's also crucial to ensure access to high-quality, relevant data and to build robust data pipelines. Cross-functional teams, including data scientists, domain experts, and IT professionals, should collaborate throughout the process. Ethical considerations like fairness, transparency, and accountability must be embedded into design and deployment. Lastly, ongoing monitoring and model retraining help maintain performance and relevance over time.

- **Implementing AI effectively requires a combination of technical, organizational, and ethical strategies.** Below are five key strategies to guide successful AI adoption:

1. **Define Clear Objectives and Use Cases:** Start by identifying specific problems AI can solve or opportunities it can enhance. Focus on measurable outcomes like improved efficiency, cost savings, or better customer experiences.
2. **Start Small with Pilot Projects:** Implement AI through small-scale pilots to test feasibility, minimize risks, and gather early feedback. Use these projects to refine models before broader deployment.
3. **Ensure High-Quality Data and Infrastructure:** AI systems rely on clean, structured, and relevant data. Invest in robust data pipelines, storage solutions, and processing tools to support model development and scalability.
4. **Foster Cross-Functional Collaboration:** Encourage collaboration between data scientists, IT teams, business stakeholders, and domain experts to ensure that AI solutions are practical, relevant, and aligned with business needs.
5. **Address Ethical and Governance Issues:** Embed fairness, transparency, and accountability into the AI lifecycle. Establish policies for responsible AI use, including bias detection, model explainability, and compliance with regulations.

Recommendations :

1. **Use AI for Personalized Customer Experiences:**
   Implement AI-driven recommendation systems, chatbots, and sentiment analysis to deliver tailored interactions and improve customer satisfaction.
2. **Develop Predictive Analytics for Smarter Decisions:**
   Use machine learning models to forecast market trends, customer behavior, and operational risks—enabling proactive and data-driven decision-making.
3. **Automate Routine and Repetitive Tasks:**
   Apply AI in robotic process automation (RPA) to streamline tasks like data entry, invoice processing, and customer service workflows, freeing up human resources for higher-value work.
4. **Enhance Product and Service Innovation:**
   Use AI to analyze customer feedback, industry trends, and usage data to generate ideas for new features, services, or entirely new offerings.
5. **Create Intelligent Supply Chain Systems:**
   Leverage AI to optimize inventory management, demand forecasting, and logistics—making the supply chain more responsive and resilient.
6. **Apply Natural Language Processing (NLP):**
   Use NLP to analyze large volumes of unstructured data (e.g., customer reviews, support tickets, social media) to extract insights and guide product or marketing strategies.
7. **Implement AI-Powered Fraud Detection and Cybersecurity:**
   Use AI algorithms to monitor transactions and network behavior for anomalies, helping detect and prevent fraud or security breaches in real time.
8. **Adopt AI for Talent Management and HR Innovation:**
   Use AI tools for resume screening, employee sentiment analysis, and workforce planning to improve hiring and retention strategies.
9. **Experiment with Generative AI for Creative Innovation:**
   Use generative AI (like ChatGPT or image generators) to support marketing, content creation, product design, and brainstorming processes.

CONCLUSION

Artificial Intelligence is no longer just a technological advantage—it is a strategic driver of business innovation. By enabling smarter decision-making, automating processes, and uncovering new opportunities, AI empowers organizations to rethink traditional models and deliver greater value to customers. Businesses that embrace AI not only enhance their efficiency but also position themselves for long-term growth and competitiveness in a rapidly evolving digital landscape. To fully realize its potential, companies must adopt AI thoughtfully—balancing innovation with ethical responsibility, data quality, and cross-functional collaboration.

DIGITAL PAYMENT SYSTEMS: ADOPTION, SECURITY, AND FUTURE TRENDS

Shaik Khaleel Ahamed, Jacintha J
Assistant Professor - Koshys Institute of Management studies Bangalore, Karnataka

Abstract
The global financial landscape is undergoing a profound transformation with the rapid adoption of digital payment systems. The shift from cash-based transactions to electronic platforms has been driven by advances in financial technology, increasing internet penetration, and the proliferation of smartphones. Digital payment systems, including mobile payments and online transactions, offer convenience, speed, and accessibility, reshaping how individuals and businesses manage their financial activities. However, despite their benefits, challenges such as limited digital literacy, infrastructural gaps, and concerns regarding security and data privacy continue to hinder widespread adoption. Cyber threats, fraudulent activities, and vulnerabilities in payment platforms further raise questions about the reliability and safety of these systems. This paper examines the factors influencing the adoption of digital payments, with particular emphasis on security issues related to mobile and online transactions. It also explores the role of emerging technologies such as biometric authentication, blockchain, and artificial intelligence in enhancing the safety and efficiency of payment systems. The findings highlight the importance of building user trust through robust security measures, regulatory frameworks, and inclusive financial strategies. The study concludes that while digital payment systems are poised to play a central role in the future of global finance, ensuring security, accessibility, and user confidence will be crucial for their sustainable growth and long-term success.
Keywords : Digital payment systems, FinTech, online transactions, mobile payments, contactless payments, adoption trends, payment security.

INTRODUCTION

The rapid evolution of technology in the financial sector has brought about a significant transformation in the way payments are conducted, leading to the emergence and widespread adoption of digital payment systems. A digital payment system refers to an electronic method of transferring money or making payments without the direct use of cash or paper-based instruments. This shift from traditional payment methods to digital platforms has been fueled by advances in financial technology (FinTech), growing internet connectivity, the proliferation of smartphones, and the increasing demand for convenience in day-to-day Scanned with OKEN Scanner transactions. Governments and financial institutions across the globe are also actively promoting cashless paymand methods to enhance efficiency, transparency, and economic growth.

Adoption of Digital Payment Systems has been accelerating rapidly due to several factors. First, the widespread use of smartphones and affordable mobile data has enabled people, even in remote regions, to access banking and payment applications. Second, user-friendly interfaces, instant fund transfers, and integration with e-commerce platforms have enhanced the convenience of digital transactions. Additionally, government initiatives, such as demonetization policies in certain countries or incentives for cashless transactions, have played a significant role in encouraging the adoption of digital payment methods. The COVID-19 pandemic further accelerated this shift, as condiscourage businesses preferred contactless transactions to reduce physical contact and ensure safety.

Security in Digital Payment Systems has become a key area of focus due to the rise in online financial activities. As the number of users grows, so do the potential threats, including phishing attacks, identity theft, and fraudulent transactions. To combat these risks, financial institutions and payment service providers are implementing advanced security measures such as two-factor authentication, biometric verification, encryption technologies, and AI-based fraud detection systems. However, maintaining a balance between security and user convenience remains a challenge, as overly complex security protocols may discourage users, while inadequate measures can lead to vulnerabilities. Trust in digital payment platforms is directly linked to their ability to safeguard users' sensitive financial information and ensure secure transactions.

Mobile Payments have emerged as one of the most significant innovations in the digital payment landscape. Through mobile banking apps, digital wallets, and contactless payment solutions, users can easily make transactions using their smartphones. Services such as Google Pay, Apple Pay, Paytm, and other regional payment apps have revolutionized the way consumers pay for goods and services, offering speed, flexibility, and convenience. Near Field Communication (NFC) technology, QR code scanning, and in-app payment gateways have further eenhanced the efficiency of mobile payments, making them accessible to a wide range of users, from urban professionals to small-scale vendors. Online Transactions have also become an integral part of the modern economy. E-commerce platforms, online bill payment services, subscription-based models, and digital fund transfers are now part of everyday life. The ease of completing transactions from anywhere, combined with round-the-clock availability, has contributed to the increasing reliance on online payment methods. Nonetheless, secure payment gateways and regulatory compliance are essential to ensure consumer confidence and prevent cybercrime.

Statement of the Problem

The increasing adoption of digital payment systems has transformed the way individuals and businesses conduct financial transactions, offering speed, convenience, and efficiency. However, this rapid shift from cash-based to digital transactions also raises several concerns. Many users, especially in developing regions, still face barriers to adoption due to a lack of digital literacy, trust, and infrastructure. At the same time, the growing incidence of cyber fraud, data breaches, and system vulnerabilities threatens the security of online transactions, undermining user confidence. While mobile payments and online transactions have made financial services more accessible, ensuring secure, reliable, and inclusive systems remains a critical challenge. Therefore, it is essential to examine the factors influencing adoption, evaluate security concerns, and explore strategies for sustainable growth in digital payment systems.

Objectives of the Study

To analyze the factors influencing the adoption of digital payment systems

2. To examine the security challenges

3. To assess the role of technology

4. To evaluate user perceptions and trust

Review of Literature

1. **Singh & Rana (2021)** investigated the factors influencing the adoption of mobile wallets in India. Their study found that perceived ease of use, trust, and government incentives significantly influenced users' willingness to adopt digital payment systems. However, lack of digital literacy and awareness remained key barriers.

2. **Choudhury &Salim (2020**) highlighted the security challenges associated with online transactions. The authors emphasized that phishing attacks, malware, and weak authentication mechanisms are major threats that undermine user trust. They suggested stronger encryption and multifactor authentication to build confidence.

3. **Al-Jabri &Sohail (2022**) explored user perceptions of mobile payments in the Middle East. Their study revealed that convenience and accessibility were major adoption drivers, while cultural resistance and privacy concerns slowed down the acceptance rate.
4. **RBI Report (2023)** on India's digital economy showed exponential growth in Unified Payments Interface (UPI) transactions. The report emphasized that government initiatives, regulatory frameworks, and low transaction costs have boosted adoption, though security vulnerabilities remain a challenge.
5. **Kumar &Dhingra** (**2024**) analyzed the role of emerging technologies like blockchain and AI in payment security. Their findings suggested that blockchain improves transparency and fraud detection, while AI enhances real-time monitoring. Both technologies are vital for future payment system resilience.

Findings

1. **Adoption Drivers**: Convenience, speed, government incentives, and mobile accessibility strongly influence digital payment adoption.
2. **Security Challenges**: Users face risks such as phishing, data theft, weak passwords, and fraudulent apps.
3. **Role of Technology**: AI, blockchain, and biometric authentication are effective in enhancing payment system security but require large-scale investment.
4. **User Perceptions**: Trust and awareness are crucial; lack of digital literacy and fear of fraud discourage adoption.
5. **Policy &Inclusivity**: While urban adoption is high, rural and underbanked populations lag due to poor infrastructure and limited awareness.

Suggestions

1. **Strengthen Cybersecurity** through mandatory multi-factor authentication, real-time fraud monitoring, and stronger regulatory compliance.
2. **Promote Digital Literacy** campaigns to educate users, especially in rural areas, on safe and efficient digital payment practices.
3. **Leverage Emerging Technologies** such as blockchain for transparency and AI for fraud detection to build trust.
4. **Encourage Inclusive Policies** by reducing transaction fees, improving rural connectivity, and incentivizing merchants to adopt digital payments.
5. **Build Consumer Trust** through awareness campaigns, transparent grievance redressal systems, and insurance against digital fraud.

CONCLUSION

Digital payment systems have revolutionized the financial ecosystem by offering convenience, accessibility, and efficiency in transactions. Adoption has been largely driven by mobile penetration, government initiatives, and the growing demand for contactless solutions. However, challenges such as cyber threats, data privacy concerns, and limited digital literacy hinder full-scale adoption. Security emerges as the most critical factor in ensuring user trust and sustainability of digital payments. Emerging technologies like blockchain, biometrics, and artificial intelligence hold the potential to strengthen payment security and enhance user confidence. For digital payment systems to achieve long-term success, stakeholders must focus on inclusivity, robust security frameworks, and user education. The future of digital payments lies not only in technological advancement but also in building trust, ensuring accessibility, and aligning with global best practices to create a safe, secure, and cashless economy.

ARTIFICIAL INTELLIGENCE AND BUSINESS INNOVATION: A PATHWAY TO COMPETITIVE ADVANTAGE

A S. Sowmini
I Bcom CA- A.V.P College of Arts and Science

Abstract
Artificial Intelligence (AI) is transforming the business landscape by driving innovation, increasing efficiency, and providing a competitive advantage. This article investigates the different uses of AI in business tasks such as customer service, marketing, sales, supply chain, finance, human resources, and product creation. AI technologies like machine learning, natural language processing, and predictive analytics help businesses automate repetitive operations, analyse massive volumes of data, and make data-driven choices. AI improves consumer pleasure and loyalty by enabling personalised experiences, demand forecasting, and sentiment analysis. In administration and finance, AI improves procedures, lowers costs, and detects abnormalities. By assisting with strategic planning and stimulating innovation, AI enables organisations to foresee market trends, respond proactively to difficulties, and preserve a competitive advantage. Overall, incorporating AI into company procedures is critical for growth, efficiency, and long-term success in today's fast changing digital economy.
Keywords: *Artificial Intelligence, Business Innovation, Digital Transformation, Automation, and Customer Engagement*.

INTRODUCTION
In the present highly competitive and dynamic corporate marketplace, innovation has become a critical component of organisational success. Businesses face ongoing pressure to adopt new technologies that not only streamline operations but also provide distinct value to customers. Among new technologies, Artificial Intelligence (AI) has received a lot of interest because of its potential to transform business operations, decision-making, and customer interaction. AI is the simulation of human intelligence in machines, which allows them to learn, reason, and make decisions. AI's integration into business activities has created new prospects for efficiency, personalisation, and strategic growth. AI is changing the way businesses operate and compete in the digital economy, from predictive analytics in marketing to supply chain automation. Companies like Amazon, Google, Tesla, and other startups have already shown how AI can be used to create a competitive advantage through innovation. However, the increasing use of AI raises concerns regarding data protection, ethical implications, workforce adaptation, and implementation costs. Businesses that successfully manage these difficulties are more likely to attain long-term viability and a competitive advantage. This study investigates the role of AI in driving corporate innovation, identifies major applications and difficulties, and looks at how organisations can strategically use AI to boost their market position in the digital age.

Review Literature
Schumpeter's Innovation Theory emphasised technological change as a key driver of business growth and competitive advantage. Building on this, recent scholars claim that AI is a disruptive invention (Christensen, 1997) that will reshape existing sectors by enabling new business models and value generation tactics.
Davenport and Ronanki (2018) divide AI applications in business into three categories: process automation, cognitive insights, and cognitive engagement. Process automation boosts efficiency by lowering human effort in repetitive operations, cognitive insights offer

sophisticated analytics for decision-making, and cognitive engagement improves consumer interactions via chatbots and virtual assistants.
AI-powered marketing solutions have been shown to improve personalisation, predictive targeting, and customer relationship management (Wedel & Kannan, 2016). In supply chain management, AI increases demand forecasting, inventory optimisation, and logistical efficiency (Choi, Wallace, & Wang, 2018). AI improves decision-making accuracy in finance by assisting with fraud detection, risk assessment, and algorithmic trading.

AI In Business Innovation

Artificial intelligence is no longer just a technical idea; it has evolved into a strategic enabler of industry-wide innovation. Businesses that integrate AI tools are discovering new ways to add value, improve efficiency, and gain a competitive advantage. AI is fostering innovation in several crucial sectors, including:

1. Marketing & Customer Engagement

AI enables organisations to provide personalised experiences via recommendation engines, targeted advertising, and predictive analytics. Companies such as Netflix and Amazon utilise AI to recommend products or content based on customer preferences, which leads to increased customer happiness and loyalty.

2. Business & Supply Management

AI-powered automation improves production, logistics, and inventory management. Walmart, for example, utilises AI to estimate demand, ensuring that shelves are stocked properly, saving waste and enhancing customer experience.

3. Finance & Risk Management

Financial organisations use AI for fraud detection, credit assessment, and algorithmic trading. AI systems analyse large datasets in real time, lowering risks and increasing decision-making accuracy. PayPal, for example, employs artificial intelligence to monitor millions of transactions and detect fraudulent activity instantaneously.

4. HR and Talent Management

AI is transforming HR operations by utilising technologies for resume screening, employee engagement, and performance measurement. Platforms such as LinkedIn use AI to connect people with suitable job opportunities, making recruitment faster and more efficient.

5. Health and Business Well-Being

AI is used in healthcare to support diagnostics, medication discovery, and virtual health aides. AI is used by hospitals and health-tech businesses to improve patient care while also lowering costs. AI-powered wellness technologies benefit organisations by increasing staff productivity and overall organisational health.

AI On Competitive Advantage

Artificial intelligence (AI) has emerged as a transformative force in modern industry, helping to develop a competitive advantage. Its ability to analyse massive volumes of data, predict patterns, and automate decision-making gives organisations the agility that traditional approaches cannot match. One of the most important effects of AI is the speed and accuracy with which it allows decision-making. Businesses may monitor real-time data from markets, consumers, and operations to quickly discover opportunities and threats. This responsiveness gives AI-powered organisations a significant competitive advantage in industries where timing and precision are important. Equally essential is AI's function in increasing cost efficiency and productivity. By automating tedious and time-consuming operations, AI frees up employees' time for creative and strategic initiatives. For example, AI-powered chatbots and robotic process automation reduce the need for human labour for routine customer

enquiries, accounting chores, and data processing. This not only reduces expenses, but also increases efficiency, scalability, and service consistency, increasing an organization's profitability. AI also promotes innovation in client experiences, which directly increases customer loyalty. Recommendation engines, virtual shopping assistants, and predictive personalisation help clients feel understood and valued. Companies such as Netflix, Spotify, and Amazon have proved how AI-powered personalisation boosts customer pleasure and repeat purchases, resulting in higher brand loyalty and retention. Furthermore, AI enables organisations to enter new markets and create creative business models. Startups in FinTech, HealthTech, and EdTech demonstrate how AI may disrupt established industries by delivering faster, cheaper, and more customer-centric solutions. This potential to restructure sectors enables enterprises of all sizes to compete with global titans.

Application Of AI In Business

1. Using AI in Marketing and Sales
AI aids companies in comprehending the preferences and behaviour of their customers. It makes predictive analytics possible to predict sales trends and find possible customers. Campaigns that are tailored to each individual boost engagement and conversions. Sentiment analysis facilitates the tracking of consumer comments on social media
2. AI in Inventory and Supply Chain Management
By anticipating demand trends, AI helps avoid stockouts and overstock. It lowers transportation expenses and delays by streamlining delivery routes. AI analytics can be used to track supplier performance. Inventory control improves in responsiveness and efficiency.
3. Artificial Intelligence in Accounting and Finance
Payroll, expenditure management, and invoicing are among the repetitious operations that AI automates. The ability of AI to recognise patterns enhances fraud detection. Accuracy in risk assessment and financial planning increases. AI insights can help businesses make well-informed decisions. This improves financial security and saves time.
4. Using AI to Manage Human Resources
AI helps with effective resume screening and applicant shortlisting. To improve workforce planning, employee engagement and performance are examined. AI makes retention strategy recommendations and forecasts possible attrition. The hiring and training procedures are expedited. Employee happiness and productivity both increase as a result.

Case Studies And Real World Examples

Many worldwide firms have effectively used artificial intelligence to drive innovation and acquire a competitive advantage. Amazon, for example, makes heavy use of AI in its recommendation engine to propose products based on customer behaviour, resulting in increased sales and pleasure. Its supply chain is also optimised with AI-driven demand forecasting and inventory management, resulting in lower prices and faster deliveries. Netflix uses AI algorithms to personalise content recommendations, analyse viewing patterns, and forecast user preferences, resulting in increased user engagement and retention. JPMorgan Chase employs AI in the financial sector to detect fraud, assess risks, and automate regular financial procedures, all of which improve accuracy and efficiency. Tesla's autonomous driving technology incorporates artificial intelligence, with machine learning processing massive quantities of real-time data to ensure safe and efficient navigation. The examples above show how AI promotes innovation, customer satisfaction, and long-term strategic success in addition to increasing operational efficiency.

Challenges And Ethical Consideration Of Ai In Business

While AI provides enormous benefits, businesses must navigate various hurdles and ethical considerations when implementing it. Bias in AI algorithms can result in unfair decisions, such as discrimination in hiring, financing, or customer targeting. Another significant concern is ensuring privacy, as AI systems frequently rely on large amounts of personal data that must be kept secure from misuse or breaches. Transparency is vital, as organisations must explain how AI choices are made in order to maintain customer and stakeholder trust. Furthermore, AI adoption can result in job displacement, especially in professions that require repetitive or routine operations, raising issues regarding worker adaptation and reskilling. Businesses must address these difficulties responsibly by implementing ethical AI processes, regulatory compliance, and ongoing monitoring to strike a balance between innovation, justice, accountability, and societal benefit.

Future Trends Of Ai In Business Innovation

The Future Of Ai In Corporate Innovation Is Being Defined By Three major trends: generative AI, autonomous systems, and AI-powered sustainability. Generative AI has progressed from experimental to become a critical tool for improving commercial processes. AI models such as GPT-4 and DALL·E are commonly utilised for automated content production, hyper-personalized marketing campaigns, and quicker software development, resulting in considerable returns on investment across industries. Autonomous systems, also known as agentic AI, are the next step towards allowing machines to observe, reason, and make real-time decisions on their own. Companies such as Volkswagen are already using AI-powered autonomous systems to optimise manufacturing and shorten product development timeframes, demonstrating their significant operational benefits.

CONCLUSION

In conclusion, the use of AI into business innovation is redefining how organisations operate, compete, and create value. Generative AI improves creativity and efficiency by automating content and providing personalised experiences, whereas autonomous systems improve decision-making speed and accuracy. AI-driven sustainability combines technology with ethical and environmental responsibility. Businesses that proactively implement AI, assuring transparency and responsible use, enjoy a competitive advantage. The convergence of generative AI, autonomous systems, and sustainability-focused AI not only promotes innovation, but also has a significant societal and environmental impact.

AI FOR BUSINESS INNOVATION

Ms.R.Girija
Assistant Professor, School of Management,
A.V.P. College of Arts and Science, Tirupur.
Dr. A. Saroja
Assistant Professor, Department of Commerce (BA),
Government Arts and Science College (Co-Ed.), Avinashi, Tirupur,

Abstract
Artificial Intelligence (AI) is one of the most disruptive forces of the 21st century, reshaping industries, economies, and societies. In business, AI is no longer just a tool for automation but a catalyst for innovation. From predictive analytics in finance to generative design in manufacturing, AI enables organizations to create new products, services, and business models. This paper explores the conceptual foundation of AI in business innovation, reviews its applications across industries, highlights the benefits and challenges of adoption, and provides analytical insights into AI's economic and organizational impact. Finally, it discusses the future trajectory of AI as a driver of sustainable competitive advantage.
Keywords: Artificial Intelligence, Business Innovation, Predictive Analytics, Generative AI, Automation, Data-Driven Decision-Making, Customer Experience, Competitive Advantage, Digital Transformation, Sustainable Growth

INTRODUCTION

Innovation has long been the foundation of business competitiveness. Traditionally, innovation was driven by human creativity, market research, and trial-and-error experimentation. However, with the advent of digital technologies, innovation has become faster, data-driven, and more customer-centric. Among these technologies, Artificial Intelligence (AI) stands out as the most transformative. AI refers to computer systems capable of performing tasks that usually require human intelligence, such as learning, reasoning, problem-solving, perception, and natural language understanding. In the business context, AI enables firms to extract insights from large volumes of data, automate decision-making, and deliver personalized experiences. According to a McKinsey report (2023), companies that have adopted AI have reported a 20–30% improvement in efficiency, customer engagement, and revenue growth. Thus, AI has moved beyond being a cost-saving tool to becoming a strategic enabler of innovation. This paper investigates how AI drives business innovation across industries, the opportunities it creates, the barriers to implementation, and its future potential.

AI and Business Innovation: A Conceptual Framework

Business innovation can be defined as the creation of new value through products, services, processes, or business models. AI supports this by:

- **Learning from Data**: Machine Learning (ML) algorithms process large datasets to detect patterns, forecast trends, and generate insights.
- **Automation and Efficiency**: AI-powered systems automate routine tasks, freeing human workers to focus on strategic and creative activities.
- **Augmented Decision-Making**: Predictive and prescriptive analytics enable leaders to make faster, evidence-based decisions.
- **Personalization**: Natural Language Processing (NLP) and recommendation engines customize offerings at an individual level.

- **New Business Models**: AI enables platforms like Uber, Netflix, and Amazon to create disruptive models based on real-time data and personalization.

The framework suggests that AI enhances innovation not only by improving existing processes but also by enabling new ways of doing business.

Applications of AI in Business Innovation

Customer-Centric Innovation

AI has revolutionized the way businesses interact with customers. Chatbots, voice assistants, and AI-powered CRM systems allow real-time engagement, while sentiment analysis helps companies understand customer emotions. For instance, Amazon's recommendation engine uses AI to suggest products, which contributes to nearly 35% of its revenue.

Process and Operational Innovation

Robotic Process Automation (RPA) streamlines repetitive tasks such as invoice processing, payroll management, and compliance reporting. In manufacturing, predictive maintenance powered by AI reduces downtime by analyzing equipment data to forecast failures. General Electric, for example, has used AI to save millions by reducing unexpected machine breakdowns.

Product and Service Innovation

AI is now actively participating in product design. Generative AI can design new car models, create advertisements, and even draft legal contracts. In healthcare, AI-based systems assist doctors in diagnosing diseases with higher accuracy. For example, IBM Watson has been deployed in oncology to support personalized cancer treatment plans.

Decision-Making and Strategy

Companies use AI-powered analytics for market forecasting, demand prediction, and financial planning. Banks apply AI to detect fraud in real-time by analyzing unusual transaction patterns. AI-driven dashboards give executives actionable insights to support long-term strategy.

Supply Chain and Logistics

AI optimizes routes for delivery trucks, manages inventory in warehouses, and predicts demand fluctuations. DHL and FedEx employ AI for intelligent logistics planning, reducing delivery time and fuel consumption.

Benefits of AI-Driven Business Innovation

The adoption of AI offers multiple benefits to businesses, including:

Enhanced Efficiency: Automation of processes reduces time and human errors.

Cost Reduction: AI minimizes operational costs by reducing waste and streamlining workflows.

Data-Driven Insights: Businesses gain accurate forecasts and risk assessments.

Customer Satisfaction: Personalized recommendations improve engagement and loyalty.

Competitive Advantage: Firms adopting AI faster enjoy better innovation cycles and stronger market positioning.

For instance, Netflix has successfully used AI to reduce churn by predicting what customers want to watch, thereby saving an estimated $1 billion annually.

Challenges and Ethical Considerations

Despite its benefits, AI adoption is not without challenges:

1. **High Implementation Cost** – Small and medium enterprises often find AI technologies financially burdensome.

2. **Lack of Skilled Workforce** – There is a global shortage of AI engineers, data scientists, and domain experts.
3. **Data Privacy Issues** – AI relies on massive datasets, raising concerns about security and compliance with regulations like GDPR.
4. **Bias in AI Algorithms** – Poorly designed algorithms can reinforce discrimination and produce biased outcomes.
5. **Cultural Resistance** – Employees often fear job loss due to AI, leading to resistance during adoption.
6. **Regulatory Gaps** – Governments are still developing frameworks to govern AI use responsibly.

Addressing these challenges requires a balanced approach, combining technological innovation with ethical governance.

Future Scope of AI in Business Innovation

The future of AI in business looks promising, with several emerging trends:

Generative AI will create original content, designs, and solutions, revolutionizing industries such as advertising, publishing, and product design.

AI + IoT + Blockchain will build secure, intelligent ecosystems for supply chains, healthcare, and finance.

Sustainable Business Innovation: AI can optimize energy consumption, reduce carbon emissions, and support green initiatives.

Human–AI Collaboration: Instead of replacing humans, AI will augment human creativity and problem-solving abilities.

Global Competitiveness: Nations and organizations that adopt AI rapidly will set the pace for the global economy.

Case Example Integration

To better understand AI's business innovation potential, case studies can be examined:

Amazon – Uses AI-driven recommendations to increase sales and improve customer experience.

Tesla – Applies AI in autonomous driving systems, disrupting the automotive industry.

Unilever – Uses AI for predictive analytics in marketing campaigns, reducing costs while improving targeting.

These examples highlight how AI-driven strategies create tangible business value.

Analytical Insights on AI Adoption in Business

AI Adoption Trends Across Industries

According to McKinsey's State of AI in 2023 report, nearly **55% of organizations** have adopted at least one AI capability. The most widely adopted functions include:

Marketing and Sales – 36%

Product Development – 31%

Supply Chain Management – 28%

Risk Management – 26%

This demonstrates that AI is transitioning from niche technology to a mainstream driver of business innovation.

Economic Impact of AI

PwC's Global AI Study (2022) estimates that AI could contribute $15.7 trillion to the global economy by 2030, with $6.6 trillion from productivity gains and $9.1 trillion from consumption-driven innovation.

Sectoral examples:

Healthcare: $150 billion savings annually in the U.S. through AI-enabled preventive care.

Retail: 20% increase in sales through AI-driven personalization.

Manufacturing: 15–20% reduction in downtime from predictive maintenance.

ROI Analysis of AI Projects

Deloitte's research reveals an average 3.5x ROI for successful AI projects. ROI depends on:

Data quality (40%),

Integration into decision-making (30%),

Employee adoption and training (20%),

Infrastructure readiness (10%).

Comparative Analysis: AI Leaders vs. Laggards

Category	**AI Leaders (Top 25%)**	**AI Laggards (Bottom 25%)**
Revenue Growth	+15% annually	+3% annually
Customer Retention	80%	55%
Operational Cost Savings	25%	8%
Innovation Speed	2× faster	Slower adoption

This analysis shows that firms leading in AI adoption outperform laggards significantly in innovation and competitiveness.

CONCLUSION

Artificial Intelligence has transitioned from being a supportive technology to a central driver of business innovation. It enables companies to enhance efficiency, engage customers in new ways, and design products and services that were unimaginable before. Analytical insights show that AI adoption directly correlates with measurable benefits such as revenue growth, cost savings, and higher ROI. However, realizing AI's full potential requires addressing challenges like ethical risks, data privacy, and workforce readiness.

Businesses that adopt AI strategically and responsibly will enjoy sustainable competitive advantage and lead in the innovation-driven global economy.

A STUDY ON EVALUATING THE ROLE OF CLOUD BASED ACCOUNTING TOOLS IN PROMOTING SDG ORIENTED PRACTISES WITH SPECIAL REFERENCE TO SME'S IN BANGALORE NORTH

Mr. Yaseen Pasha, Mrs. Mala J
Research Scholars, School of Commerce,
A.V.P. College of Arts and Science (Co-Education), Tirupur, Tamilnadu, India

Abstract
Small and Medium Enterprises (SMEs) form the backbone of India's economy by contributing significantly to employment generation, innovation, and regional development. With increasing global emphasis on sustainability, there is a growing need for SMEs to align their operations with the United Nations' Sustainable Development Goals (SDGs). However, limited resources and traditional accounting practices often hinder their ability to adopt sustainable and transparent business models. In this context, cloud-based accounting tools have emerged as a cost-effective and scalable solution, offering real-time financial reporting, reduced reliance on paper-based processes, and enhanced accountability. This study aims to evaluate the role of cloud-based accounting tools in promoting SDG-oriented practices with special reference to SMEs in Bangalore North. Adopting a descriptive and analytical research design, primary data will be collected through structured questionnaires administered to SME owners, managers, and accounting professionals. Statistical techniques such as Chi-Square, Correlation, and Regression will be employed to assess the association, strength, and predictive influence of cloud-based accounting adoption on SDG-oriented outcomes, including financial transparency, environmental responsibility, and sustainable decision-making. The findings are expected to demonstrate the extent to which cloud-based accounting tools contribute to fostering sustainability and efficiency in SMEs, while also identifying the challenges encountered in digital adoption. The study provides theoretical contributions to the field of accounting and sustainability, while also offering practical implications for SME practitioners, policymakers, and technology providers in strengthening digital transformation strategies aligned with the SDGs.
Keywords: Cloud-Based Accounting, Sustainable Development Goals (SDGs), SMEs, Digital Transformation, Bangalore North, Sustainability, Financial Transparency

INTRODUCTION

Recent data from 2025 underscores how digital adoption is altering the MSME landscape across India. According to SIDBI, over 90% of MSMEs now accept digital payments, driven heavily by UPI and smartphone penetration. YourStory.com Additionally, a survey by PayNearby shows that more than 73% of small businesses in semi-urban and rural India have reported increased income or improved operational efficiency as a result of adopting digital tools. The Economic Times The market for online/cloud accounting software is also growing globally, the sector was valued at about USD 5.38 billion in 2025, with projections to grow rapidly in the coming years. Business Research Insights Bangalore North, a fast-growing hub for entrepreneurship and SMEs, presents an ideal setting to study the role of cloud accounting in promoting SDG-oriented practices. Many SMEs in this region are experimenting with digital solutions, but the extent to which cloud-based accounting supports sustainability integration remains underexplored. This study, therefore, seeks to evaluate how cloud accounting adoption influences the adoption and implementation of SDG-oriented practices among SMEs in Bangalore North, thereby contributing to both academic discourse and practical recommendations for policymakers, practitioners, and technology providers.

OBJECTIVES OF THE STUDY

1. To assess the level of adoption and usage of cloud-based accounting tools among SMEs in Bangalore North.
2. To evaluate the impact of cloud-based accounting tools in promoting SDG-oriented practices such as financial transparency, environmental sustainability, and accountability.
3. To examine the relationship between the adoption of cloud-based accounting tools and the enhancement of business performance and sustainable decision-making.

RESEARCH GAP

Thus, this study attempts to bridge the gap by providing empirical evidence from SMEs in Bangalore North, using statistical tools such as Chi-square, Correlation, and Regression to analyze the impact of cloud-based accounting on SDG-oriented practices and sustainable decision-making.

LITERATURE REVIEW

1. Cloud Accounting and SME Performance

Cloud accounting has gained significant traction among SMEs as a cost-effective and scalable alternative to traditional accounting systems. It allows businesses to access financial data in real time, streamline processes, and enhance decision-making (Smith, 2020). Gupta and Mehra (2021) argue that SMEs benefit from reduced infrastructure costs, improved accuracy, and greater accessibility when using cloud platforms. In India, the adoption of cloud solutions has also been associated with compliance improvements and better integration of financial management into day-to-day operations (Sharma & Reddy, 2023).

2. Cloud Accounting and Sustainability Practices

Technology adoption has been closely linked with the implementation of sustainability initiatives. Kim and Park (2019) highlight that cloud accounting reduces paper dependency, enhances reporting transparency, and supports sustainability audits. Similarly, Ofori and Boateng (2022) found that SMEs adopting digital accounting platforms were better equipped to monitor energy use, reduce waste, and align their operations with the Sustainable Development Goals (SDGs). Cloud Adoption and SDG Integration in the Indian Context

RESEARCH METHODOLOGY

Research Design

The present study adopts a descriptive and analytical quantitative research design. The descriptive aspect focuses on assessing the current level of adoption and usage of cloud-based accounting tools among SMEs in Bangalore North, while the analytical aspect examines the relationship between cloud adoption and SDG-oriented practices such as transparency, sustainability, and accountability. A structured survey was conducted to collect primary data, and the responses were analyzed using statistical tests to meet the study objectives.

Population and Sample

The population of the study consisted of Small and Medium Enterprises (SMEs) located in Bangalore North, as this region has emerged as a hub of entrepreneurial activity and technology adoption. Due to constraints of time and accessibility, a sample of 36 respondents was chosen using a purposive sampling technique, ensuring that participants represented business owners, managers, and accounting professionals who were familiar with digital or cloud-based accounting practices.

DATA COLLECTION METHOD

The study relied primarily on primary data collected through a Google Form questionnaire. The questionnaire was designed in alignment with the objectives of the study and divided into four sections:

1. Demographic profile of respondents (e.g., firm size, sector, years of operation).
2. Adoption and usage of cloud-based accounting tools (extent, frequency, purpose).
3. SDG-oriented practices (financial transparency, environmental sustainability, accountability).
4. Perceptions of business performance and decision-making influenced by cloud accounting.

The questionnaire used a 5-point Likert scale (1 = Strongly Disagree, 5 = Strongly Agree) for measuring attitudes, alongside categorical and factual questions for background details

.

ETHICAL CONSIDERATIONS

Ethical practices were strictly followed during the study. Respondents were informed of the academic purpose of the research, and their consent was obtained before participation. Anonymity and confidentiality were maintained, and the data collected through Google Forms was used solely for research purposes.

DATAANALYSIS AND INTERPRETATION

Objective 1: To assess the level of adoption and usage of cloud-based accounting tools among SMEs in Bangalore North

Test Used: Chi-Square Test

Statistics	Value
Chi-Square	10.9908
Degrees of Freedom (df)	3
p-value	0.0118

Interpretation:

The Chi-Square test was used to examine the association between categorical variables (e.g., SME size and the adoption of cloud-based accounting tools). The calculated Chi-Square value is 10.9908 with 3 degrees of freedom, and the p-value is 0.0118, which is less than the conventional significance level of 0.05.

Objective 2: To evaluate the impact of cloud-based accounting tools in promoting SDG-oriented practices such as financial transparency, environmental sustainability, and accountability

Test Used: Pearson Correlation

Variables	Correlation (r)
Cloud-based accounting adoption & Reduction in paper usage	0.271

Interpretation:

The correlation coefficient (r = 0.271) indicates a positive relationship between the use of cloud-based accounting tools and the adoption of environmentally sustainable practices,

specifically reducing paper usage in accounting. Although the correlation is moderate, it suggests that firms using cloud accounting tools are somewhat more likely to implement sustainable practices in their financial operations.

Objective 3: To examine the relationship between the adoption of cloud-based accounting tools and the enhancement of business performance and sustainable decision-making
Test Used: Multiple Regression Analysis

Regression Model Summary:

Statistics	Value
Multiple R	0.944
R Square	0.891
Adjusted R Square	0.852
Standard Error	0.695
Observations	27

ANOVA Table:

Source	df	SS	MS	F	Significance F
Regression	1	102.455	102.455	212.33	1.007×10^{-13}
Residual	26	12.545	0.483	—	—
Total	27	115	—	—	—

Interpretation:
The R Square value of 0.891 indicates that approximately 89.1% of the variation in business performance and sustainable decision-making is explained by the adoption of cloud-based accounting tools. The F-statistic ($F = 212.33$, $p < 0.001$) shows that the regression model is highly significant, indicating a strong predictive relationship. The Multiple R (0.944) confirms a strong positive correlation between cloud accounting adoption and enhanced business performance/sustainable decision-making.

FINDINGS
Chi-Square Test results showed a significant association (Chi-Square = 10.991, df = 3, p = 0.0118) between SME characteristics and the adoption of cloud-based accounting tools.
Interpretation: Adoption is not uniform across SMEs; larger or technologically advanced firms
Interpretation: Adoption is not uniform across SMEs; larger or technologically advanced firms are more likely to adopt cloud accounting, while smaller firms may face challenges such as limited resources, lack of awareness, or technical expertise.
Correlation analysis between cloud adoption and SDG-oriented practice (reducing paper usage) showed a positive correlation ($r = 0.271$).
Interpretation: SMEs using cloud accounting tools are moderately more likely to implement sustainable practices such as reducing paper usage, enhancing transparency, and promoting accountability. While the effect is moderate, it highlights cloud accounting as a useful enabler for environmental sustainability.
Regression analysis showed a strong positive relationship: $R^2 = 0.891$, $F = 212.33$, $p < 0.001$.

Interpretation: Approximately 89.1% of the variation in business performance and sustainable decision-making is explained by cloud adoption. This indicates that SMEs leveraging cloud- based accounting tools are likely to experience improved efficiency, better resource management, and enhanced sustainability integration in decision-making.

SUGGESTIONS

Based on the findings, the following suggestions are proposed for SMEs and policymakers:

1. Encourage Cloud Accounting Adoption:
2. Provide Technical Training:
3. Promote SDG Integration:
4. Government and Policy Support:
5. Continuous Monitoring:

CONCLUSION

Adoption of cloud-based accounting tools varies significantly across SMEs based on firm size and technological readiness. Cloud adoption has a positive effect on SDG-oriented practices, particularly environmental sustainability and transparency, indicating that digital tools can facilitate responsible business practices.Cloud accounting adoption strongly predicts business performance and sustainable decision- making, with 89% of variation explained, highlighting the strategic importance of technology for SME growth and sustainability integration.

GLOBAL BUSINESS AND CROSS-CULTURAL MANAGEMENT

S. Rithika, R. Mahisha Varthini
III – B.Com (Computer Applications)
A.V. P College of Arts and Science

Abstract
In today's interconnected world, global business has become an inevitable reality for organizations striving to sustain growth and competitiveness. The expansion of international trade, digital connectivity, and multinational collaborations has intensified the need to understand cultural diversity within the workplace. Cross-cultural management plays a vital role in ensuring effective communication, conflict resolution, leadership, and decision-making across diverse cultural settings. Businesses operating globally face challenges such as language barriers, differing work ethics, contrasting leadership styles, and variations in negotiation patterns. At the same time, cultural diversity also provides opportunities for innovation, creativity, and the development of inclusive practices. This paper explores the dynamics of global business and cross-cultural management by examining the importance of cultural intelligence, adaptation of management strategies, and the integration of global leadership skills. It highlights key theories of cultural dimensions, real-world examples of multinational companies, and strategies to overcome cultural barriers. The discussion emphasizes that successful global business requires not only economic and strategic planning but also the ability to embrace cultural diversity as a core competency. By fostering cultural awareness and sensitivity, organizations can create stronger partnerships, enhance employee performance, and achieve sustainable success in the competitive international market.
Keywords:Global Business, Cross-Cultural Management, Cultural Diversity, Cultural Intelligence, Global Leadership, International Trade, Multinational Corporations, Intercultural Communication, Hofstede's Cultural Dimensions, Trompenaars' Model, High- and Low-Context Cultures

INTRODUCTION

The globalization of business has transformed the way organizations operate, creating new opportunities and challenges in managing diverse workforces across borders. Companies are no longer confined to domestic markets; instead, they engage with international clients, suppliers, and employees on a daily basis. This global integration has given rise to the importance of cross-cultural management, a discipline that focuses on understanding and managing cultural differences in business contexts. cross-cultural management is not merely about avoiding misunderstandings; it is about leveraging cultural diversity to achieve organizational objectives. With the growing presence of multinational corporations, joint ventures, and international mergers, managers are required to navigate diverse cultural expectations regarding leadership, communication, decision-making, and employee motivation. For example, while some cultures value hierarchy and formal authority, others emphasize equality and participative leadership. Similarly, communication styles may vary from direct and explicit to indirect and context-dependent, influencing negotiations and workplace collaboration. this paper presentation will explore the intersection of global business and cross-cultural management by analyzingthe relevance of cultural theories, the challenges faced by international organizations, and the strategies required to manage cultural diversity effectively. The discussion will further highlight the importance of cultural intelligence, global leadership, and adaptability as essential skills for business professionals in the 21st century. Ultimately, the objective of this paper is to demonstrate that cross-cultural management is not an optional skill, but a critical success factor in the globalized economy.

1.Global Business: Scope and Significance

Global business refers to commercial activities that extend beyond national boundaries, covering trade, investment, supply chain management, and multinational collaborations. Its scope is vast, ranging from international marketing and outsourcing to foreign direct investment and global partnerships. With advancements in technology, businesses now operate in a borderless world where digital platforms enable instant communication and online trade, connecting firms with customers and suppliers worldwide.

Several forces drive global business, including rapid technological innovation, trade liberalization policies, mobility of human talent, and the increasing demand for diverse goods and services. Globalization has allowed companies to reduce costs by outsourcing labor and manufacturing, to access new consumer bases, and to improve competitiveness by adopting global best practices. However, expanding internationally also requires organizations to adapt to the cultural, legal, and political environments of host countries. For instance, companies like McDonald's or Coca-Cola have been successful globally because they adapt their products and marketing strategies to local tastes and preferences while maintaining a consistent global identity. This ability to balance global strategies with local adaptation has become one of the most critical aspects of global business.

2.Cross-Cultural Management: Concept and Importance

2.1 Cross-cultural management is the practice of managing people and processes in multicultural contexts by recognizing and valuing cultural differences. In a world where organizations rely on international teams, cultural sensitivity is no longer optional but a prerequisite for success. It influences how organizations communicate, negotiate, make decisions, and motivate employees. Without proper cultural understanding, businesses risk misinterpretations, low employee engagement, and conflicts that can damage partnerships and reputation.

2.2 The importance of cross-cultural management can be seen in the way it strengthens collaboration among employees, builds trust between international partners, and enhances the adaptability of leadership across diverse environments. It provides the tools for preventing misunderstandings and fostering innovation through diverse perspectives. For example, a multicultural team can combine unique insights from different cultural backgrounds, leading to creative solutions that would not emerge in a culturally uniform environment. Thus, cross-cultural management is not only about managing diversity but also about leveraging it as a source of strength.

3. Theoretical Models of Cross-Cultural Management

3.1 Hofstede's Cultural Dimensions

Power Distance: Acceptance of hierarchy (e.g., India – high; Denmark – low).
Individualism vs. Collectivism: U.S. vs. Japan.
Uncertainty Avoidance: Greece (high) vs. Singapore (low).
Masculinity vs. Femininity: Japan (competitive) vs. Sweden (cooperative).
Long-Term vs. Short-Term Orientation: China (long-term) vs. U.S. (short-term).
Indulgence vs. Restraint: U.S. (indulgent) vs. Russia (restrained).

3.2 Trompenaars' Model

Universalism vs. Particularism (rules vs. relationships).
Specific vs. Diffuse (clear vs. overlapping personal-professional boundaries).
Achievement vs. Ascription (merit vs. status-based recognition).

3.3 Hall's High and Low Context

High-context: Implicit, relationship-focused (e.g., China, Japan).
Low-context: Explicit, task-focused (e.g., Germany, U.S.).

4. Challenges in Cross-Cultural Management

4.1 Communication Barriers

Misinterpretation of language, gestures, and tone.
Example: A nod in Bulgaria means "no," unlike in most countries.

4.2 Leadership Differences

Western cultures value participative leadership; Asian cultures often prefer hierarchy.

4.3 Work Ethics and Time Orientation

U.S. employees prioritize deadlines; Latin American employees may value relationships over strict time schedules.

4.4 Negotiation Styles

Germans prefer detailed contracts; Chinese negotiators focus on long-term relationships.

4.5 Managing Diversity

Stereotypes, discrimination, and unconscious bias remain major barriers.

5. Strategies for Effective Cross-Cultural Management

To overcome these challenges, organizations must invest in developing cultural intelligence, which involves the ability to understand, adapt, and interact effectively in diverse cultural contexts. Cultural intelligence includes cognitive awareness of cultural frameworks, motivational willingness to engage with different cultures, and behavioral flexibility to adjust communication and leadership styles.

5.1 Training and awareness programs are also essential, equipping employees with the skills needed to interact effectively in multicultural environments. Language training, diversity workshops, and cross-cultural simulations can prepare teams for international collaboration. Leadership must also adopt a flexible and adaptive approach, recognizing that a single management style cannot fit all cultural contexts. Successful leaders combine global strategies with local practices, balancing corporate identity with cultural sensitivity.

5.2 Inclusive work environments further strengthen cross-cultural management by creating policies that promote equity and respect for cultural traditions. Celebrating cultural events, respecting local holidays, and providing equal opportunities to employees from diverse backgrounds foster a sense of belonging. Additionally, technology plays a significant role in bridging gaps, with digital collaboration platforms, AI-driven translation tools, and virtual conferencing reducing the barriers of distance and language.

6.Case Studies

Real-world examples demonstrate the importance of cross-cultural management in global business. Unilever has successfully adapted its products and marketing strategies to suit local cultures, offering specialized goods such as skin-lightening creams in Asia and herbal products in Africa, while maintaining its global reputation. Similarly, Google and Microsoft have embraced inclusivity and diversity as core values, building global teams that thrive on innovation.

Conversely, companies like Walmart in Germany and Best Buy in China highlight failures in cross-cultural adaptation. Walmart struggled in Germany because it failed to understand consumer expectations and employee culture, such as resistance to American-style cheerleading and smiling greeters. Best Buy's entry into China failed because the company misjudged consumer preferences for smaller, locally managed electronics shops rather than

large retail chains. These cases emphasize that success in global business depends heavily on cultural understanding.

7. The Future of Global Business and Cross-Cultural Management

Remote Work: Rise of global virtual teams.
Sustainability: Businesses adopting eco-friendly and culturally sensitive practices.
AI and Technology: Virtual reality meetings, real-time translation.
Global Leaders: Need emotional intelligence, adaptability, and empathy.

CONCLUSION

Global business and cross-cultural management are inseparable in the modern economy. While globalization creates immense opportunities, it also presents complex cultural challenges that organizations must address. Effective cross-cultural management requires not only theoretical understanding but also practical skills in communication, negotiation, and leadership. Companies that embrace cultural intelligence and inclusivity are better positioned to succeed in the global marketplace. Therefore, mastering cross-cultural management is not just a managerial responsibility, but a strategic necessity for sustainable global success.

INDUSTRIAL MICROBIAL BIOTECHNOLOGY: APPLICATIONS AND FUTURE PROSPECTS

Vaishnavi. L
Dr. Sangeetha.B
Department of Biotechnology, KG College of Arts and Science, Coimbatore

Abstract

Microbial biotechnology is a dynamic interdisciplinary discipline that utilizes the metabolic capabilities of archaea and microalgae to develop a wide range of industrial, environmental, agricultural, and medical applications. Genetically enabled cell factories and developments in molecular biology have streamlined the production of high-value substances such as food additives, enzymes, biofuels, bioplastics, and medicines. From prehistoric fermentation techniques to contemporary genome editing and systems biology, this paper examines the development of microbial biotechnology over time. Microbial lipases and the role of modified microorganisms in waste management, biofuel production, and pharmaceutical manufacturing are highlighted in industrial processes. Special focus is given to pharmaceutical biotechnology, where microbes are employed to produce antibiotics, vaccines, recombinant proteins, and hormones. The integration of omics technologies and artificial intelligence is revolutionizing microbial strain design, paving the way for sustainable and circular bioeconomic solutions. Overall, microbial biotechnology continues to be a cornerstone of innovation, driving the transition toward greener, more efficient industrial systems.

Keywords: Microbial biotechnology, microbial enzymes, pharmaceutical biotechnology, biofuels, synthetic biology.

Introduction:

Microbial biotechnology is a branch of applied microbiology that harnesses the capabilities of microorganisms—such as bacteria, fungi, archaea, and microalgae—for industrial, environmental, agricultural, and medical applications. These microbes naturally possess the ability to synthesize valuable compounds, degrade pollutants, recycle nutrients, and interact with their environments in ways that can be exploited for human benefit. (Singh2014).With developments in synthetic biology, genetic engineering, and molecular biology, the subject has undergone tremendous change, making it possible to create microbial cell factories—engineered microbial strains. These strains are optimized to produce biofuels, pharmaceuticals, enzymes, organic acids, and bioplastics at industrial scales. (Ward, O. P., & Ray, R. C. 2006).In environmental biotechnology, microbes are utilized for bioremediation of contaminated sites, wastewater treatment, and bioenergy production through processes such as anaerobic digestion and microbial fuel cells. In agriculture, beneficial microbes improve soil health, suppress pathogens, and support sustainable crop production through biofertilizers and biopesticides. (Chen, G. Q. 2012). The integration of omics technologies (genomics, proteomics, metabolomics) and systems biology has further enhanced our ability to understand and manipulate microbial functions for targeted applications. Microbial biotechnology continues to play a crucial role in building a circular bioeconomy, reducing dependence on fossil fuels, and addressing global challenges related to pollution, food security, and climate change. (Bansal, A. K. (2005).

1.1. Significance of microbes in Industrial processes

Microorganisms are indispensable to numerous industrial processes due to their versatility, efficiency, and sustainability.They are perfect catalysts for a wide range of applications in industries like medicines, food and beverage, chemicals, biofuels, and environmental engineering because of their capacity to perform intricate biochemical changes under benign circumstances. (Thapa, S. et al. (2019). Fermentation technology is one of the

main industrial applications of microorganisms, where they are used to create useful metabolites such as lactic acid, citric acid, ethanol, and antibiotics. For instance, Aspergillus niger is well-known for its function in the synthesis of citric acid, whereas Saccharomyces cerevisiae is widely employed in the manufacturing of ethanol. Additionally, microbes are effective makers of industrial enzymes such as cellulases, lipases, amylases, and proteases, which are essential in industries like food production, detergent manufacturing, textile manufacturing, and leather processing. These enzymes reduce the need for harsh chemicals and energy-intensive processes, contributing to greener industrial practices. (Singh, R., et al. 2016).

In the bioplastics and bio-based materials industry, bacteria such as Cupriavidusnecator are used to produce polyhydroxyalkanoates (PHAs), biodegradable polymers that offer sustainable alternatives to petroleum-based plastics.(Russell, J. B. et al. (2009). In addition, the use of synthetic and genetically engineered microbes enables improved stress tolerance, substrate consumption, and productivity. Due to developments in synthetic biology and metabolic engineering, microbial cell factories have been created that can be modified to generate high-value products with higher yields and purity. (Bull, M. J., & Plummer, N. T. (2014). The foundation of the expanding bioeconomy is microbial processes due to their affordability, scalability, and environmental friendliness. In order to facilitate circular production systems and lessen environmental footprints, microorganisms are predicted to become increasingly more important as businesses transition to sustainable technologies. (Liese, A. et al. (2006).

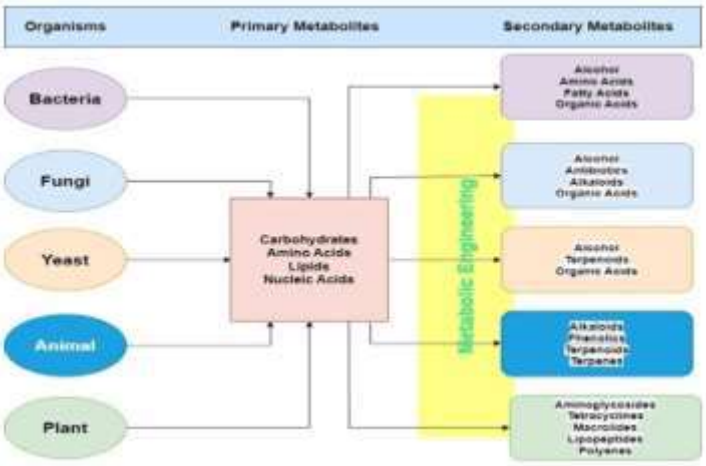

Fig:1

1.2. Historical perspective and modern development

The origins of microbial biotechnology date back thousands of years, long before the microbial world was scientifically understood. Ancient civilizations unknowingly harnessed the power of microorganisms in traditional processes such as fermentation to produce bread, beer, wine, and yogurt. These early practices marked the first applications of microbes in human industry (Bull, M. J., & Plummer, N. T. (2014) . For thousands of years, humans have utilized microbes to produce goods like wine, beer, and bread, but only for human. consumption. Several papers about the history of biotechnology have revealed that archaic societies developed biotechnological methods between 5000 and 10,000 BCE. The civilizations of the Indus Valley and Egypt employed various methods to preserve and make alcoholic drinks, bake bread, and convert nutrition (Maurya, D. K. et al. (2021) . The scientific foundation of microbial biotechnology began in the 17th century with Antonie van Leeuwenhoek, who first observed microorganisms using a microscope. In 1894, Japanese scientist Jokichi Takamine produced enzymes using microbial activity for the first time in an

industrial setting in the United States. The term "biotechnology" was used by Hungarian expert K. Ereky in his 1919 book. (Raju, P. (2016).

Louis Pasteur's work on fermentation and the germ theory of disease, as well as Robert Koch's creation of techniques for bacterial isolation and identification, led to a rapid advancement in the discipline during the 19th century. With Alexander Fleming's 1928 discovery of penicillin, which marked the beginning of the industrial manufacture of antibiotics and the dawn of pharmaceutical microbiology, microbial biotechnology entered a new era in the 20th century. Large-scale fermentation techniques, which are employed in the synthesis of solvents, vitamins, and amino acids, were also developed in the middle of the 20th century (Buchholz, K., & Collins, J. (2013).

According to quick developments in genetic engineering, systems biology, and synthetic biology, microbial biotechnology is now in the vanguard of the bioeconomy. CRISPR-Cas is one of the most revolutionary techniques available because it makes genome editing accurate and efficient, enabling scientists to alter microbial genomes with previously unheard-of precision. Additionally, metabolic engineering has emerged as a key strategy that makes it possible to restructure microbial metabolic pathways to improve the synthesis of targeted substances including industrial chemicals, medicines, and biofuels (Abraham, E. P., & Chain, E. (1940).

The rise of synthetic biology has pushed the boundaries even further by allowing scientists to construct entirely new genetic circuits and even synthetic microbial strains with tailored functionalities. Alongside these developments, omics technologies—including genomics, transcriptomics, proteomics, and metabolomics—have provided deep insights into microbial physiology and interactions, facilitating data-driven strain improvement (Brockhaus et al. (1901).

Moreover, the integration of machine learning and artificial intelligence is accelerating strain design and optimization, especially in automated bio-foundries. New frontiers such as microbiome engineering and the use of engineered microbial consortia are opening doors to applications in environmental remediation, agriculture, and personalized medicine. Together, these innovations are reshaping industrial biotechnology by making microbial processes more efficient, sustainable, and versatile than ever before (Schürrle, K. (2020).

Era/Period	**KeyDevelopments**	**Impact/Applications**
AncientTimes	Fermentation of food and beverages using wild microbes	Bread, beer, wine, yogurt production
17thCentury	Discovery of microorganisms by Antonievan Leeuwenhoek	Foundationofmicrobiology
19thCentury	Pasteur’s fermentation work, Koch’s postulates	Germ theory, controlled microbial processes
Early20th Century	Discovery and production of antibiotics (e.g., penicillin)	Pharmaceuticalmicrobiology, treatment of infections
Mid-20thCentury	Large-scale fermentation technology development	Industrial production of vitamins, aminoacids, and solvents
1970s–1980s	Genetic engineering and recombinant DNA technology	Microbial production of insulin, hormones, enzymes
1990s	Genomics and automation in strain development	High-throughput screening, metabolic pathway mapping
2000s	Systems biology and metabolic engineering	Optimized microbes for industrial biosynthesis

2010s	CRISPR-Cas9andsynthetic biology	Precision genome editing, synthetic microbial consortia
2020s–Present	AI-driven bioinformatics, micro biomeengineering, biofoundries	Smart biomanufacturing, environmental remediation, circular bioeconomy

Table: 1

2.1. Microbial enzymes for Industries

Microorganisms are preferred sources of industrial enzymes because of their rapid growth rate and ease of availability. Because of their quick growth rates, genetic flexibility, and capacity for extracellular enzyme secretion, microorganisms including bacteria, fungus, and yeasts are abundant makers of enzymes.

These enzymes catalyze specific biochemical reactions under mild conditions, replacing harsh chemicals and energy-intensive methods in industries like food and beverages, textiles, paper and pulp, biofuels, detergents, and pharmaceuticals. Commonly produced enzymes include amylases, proteases, lipases, cellulases, and xylanases, each tailored to specific industrial applications. Advances in strain improvement, fermentation technology, and genetic engineering have significantly enhanced enzyme yield, stability, and specificity, making microbial enzyme production more efficient and commercially viable than ever before (Liu, L. et al. (2013).

2.2.Pectinase

Pectinase enzymes are produced by bacteria, yeasts, filamentous fungus, and plants and are extensively utilized in the food and beverage industries. Fruit ripening, fruit juice reduction and viscosity clarification, tomato pulp extraction, tea and chocolate fermentation, vegetal waste treatment, fibre degumming in the textile and paper industries, animal nutrition, protein enrichment of infant food, and oil extraction are all applications for the enzyme in the food industry. The aforementioned enzyme is mostly used in the extraction, clarification, and concentration stages of the juice processing industry. Additionally, enzymes are employed to improve the stability of processed peaches and pickles, restore taste lost during drying, and lessen the bitterness of citrus peel. (Robinson, P. K. (2015).

Microorganism	**Type**	**Pectinase activity**	**Industrial Applications**
Aspergillus niger	Fungus	High (polygalacturonase, pectin lyase)	Fruit juice clarification,textile,winemaking
Penicilliumspp	Fungus	Moderate	Juiceextraction, wastetreatment
Bacillussubtilis	Bacterium	Moderate	Waste treatment, industrialenzymeblends
Erwinia carotovora	Bacterium	Very high	Plant tissue maceration (lab use;notindustrial)
Pseudomonas fluorescens	Bacterium	Lowtomoderate	Research,limited commercial use

Table 2 (De Gregorio, A. et al. (2002).

2.3. Lipase

Since lipase enzymes can break down lipids into fatty acids and glycerol, they are widely used in many different sectors. In the food industry, they help change fats for improved texture and shelf life, improve dough stability during baking, and boost the formation of flavour in cheese and other dairy products. Lipases are essential ingredients in biological detergents used in the detergent business. They aid in the removal of fat-based stains like oil and grease, particularly at lower washing temperatures. An important class of enzymes involved in the metabolism of lipid breakdown are lipolytic enzymes, which include lipases and esterases. Oil and soil waste include bacteria that produce lipase, such as Penicillium restrictum. Microbial lipases are currently being used by Novozymes, Amano, and Gist Brocades.Several microbes, such as Candida rugosa, Candida antarctica, Pseudomonas alcaligenes, Pseudomonas mendocina, and Burkholderiacepacia, generate lipase (Barbesgaard, P. et al. (1992).

Microorganism	**Type**	**Lipase Activity**	**Industrial Applications**
Aspergillusniger	Fungus	High	Detergents, food processing, biodieselproduction
Candidarugosa	Yeast	Very high	Dairy, pharmaceuticals, ester synthesis
Penicillium chrysogenum	Fungus	Moderate	Oil degradation, environmentalcleanup
Pseudomonas aeruginosa	Bacterium	Very high (thermostable)	Biodiesel, detergent, and pharmaceutical industries
Pseudomonas fluorescens	Bacterium	High	Fathydrolysis, foodflavoring

Table 3 (Kokusho, Y. et al. (1982).

2.4. Cellulase

Cellulases are enzymes that degrade the glycosidic linkages in cellulose microfibrils, releasing oligosaccharides, cellobiose, and glucose.Numerous industries, including waste management, medical-pharmaceutical, and wood pulp and paper, use these hydrolytic enzymes.

Cellulases are employed in the food industry to extract ingredients from sweet potato starch, green tea, soy protein, essential oils, and aromatic products. They work in tandem with hemicelluloses and pectinases to extract and clarify fruit juice. Following fruit crushing, enzymes are added to encourage liquefaction by breaking down the solid phase. The juice and wine industries use cellulases as supplement pectinases for extraction, clarification, and filtration, which improves yield, flavor, and filter/finisher longevity. (Soares, I. et al. (2012).

Microorganism	**Type**	**Cellulase Activity**	**Industrial Applications**
Penicilliumspp.	Fungus	Moderate	Textile,paper industry,wastetreatment
Fusarium oxysporum	Fungus	High	Lignocellulose degradation, biofuelproduction
Bacillussubtilis	Bacterium	Moderate	Textileindustry, agriculture

Streptomycessp p.	Bacterium	Moderate	Soilbiomassdegradation, composting
Thermomonospora spp.	Actinomycete	Thermostable cellulases	High-temperature industrialprocesses

Table :4 (Soares, I. et al. (2012)

3.1. Industrial Application of using microorganism

Microorganisms play a vital role in a wide range of industrial applications due to their remarkable metabolic diversity, rapid growth, and ability to function under controlled conditions. From traditional fermentation to cutting-edge biotechnological innovations, microbes have been harnessed to produce valuable products such as enzymes, biofuels, pharmaceuticals, organic acids, and food additives. Their use has revolutionized industries including food and beverage, textiles, agriculture, paper and pulp, and waste treatment. The ability to genetically modify microbial strains has further expanded their utility, allowing for improved yield, stability, and substrate specificity. As industries increasingly seek sustainable and eco-friendly alternatives to chemical processes, microorganisms offer a reliable and efficient platform for green manufacturing and circular bioeconomy solutions. (Peng, L., Fu, D., Chu, H., et al. 2022)

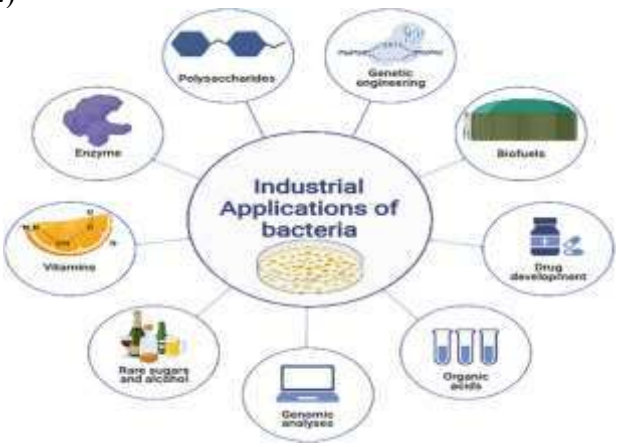

Fig:2 Industrial application of bacteria

3.2. Biofuel production

Biofuel production using microorganisms involves the microbial conversion of organic biomass into

energy-rich fuels such as bioethanol, biobutanol, biodiesel, and biogas. The process typically begins withfeedstock preparation, where lignocellulosic materials like agricultural residues, sugarcane, or corn are pretreated to release fermentable sugars. In the next step, enzymatic hydrolysis—often using microbial cellulases—breaks down complex carbohydrates into simple sugars. These sugars are then fermented by microorganisms such as Saccharomyces cerevisiae (for ethanol) or Clostridium acetobutylicum (for butanol) under anaerobic conditions. For biodiesel production, lipid-accumulating microbes like Yarrowialipolytica or Chlorella species (microalgae) are cultivated to produce oils, which are then trans esterified into biodiesel. In biogas production, consortia ofanaerobic bacteria and archaea decompose organic matter in digesters to produce methane-rich gas. (Malode, S. J. et al. (2021).

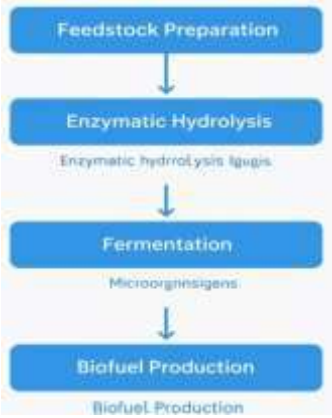

Fig 3: Biofuel production in microorganisms

3.3. Food and beverage industry

Microorganisms are indispensable to the food and beverage industry, where they are used to ferment, preserve, and enhance the quality of a wide range of products. For example, Saccharomyces cerevisiae, a yeast, is widely used in the baking and alcoholic beverage industries for bread leavening and the production of beer, wine, and spirits through alcoholic fermentation. In dairy production, lactic acid bacteria such as Lactobacillus bulgaricus, Streptococcus thermophilus, and Lactococcus lactis are employed to produce yogurt, cheese, and cultured milk by fermenting lactose into lactic acid, which also acts as a preservative and flavor enhancer. Aspergillus oryzae and Rhizopus oligosporus are essential in Asian fermented foods like soy sauce, miso, and tempeh, where they help break down complex proteins and starches. Probiotic strains such as Lactobacillus rhamnosus,Lactobacillus acidophilus, and Bifidobacterium bifidum are added to functional foods and beverages to promote digestive health and immune function. Moreover, microbial enzymes like amylases (from Bacillus subtilis), proteases (from Aspergillus niger), and lipases (from Candida rugosa) are used in food processing to improve dough handling, protein hydrolysis, and flavour development. These microbes not only contribute to product safety and shelf life but also support clean-label, plant-based, and health-promoting innovations in modern food systems. (Olempska-Beer, Z. S., et al. (2006).

3.4. Pharmaceutical industry

Pharmaceutical biotechnology harnesses the capabilities of microorganisms such as bacteria, yeast, and fungi to develop and produce pharmaceutical products. Through genetic engineering and fermentation techniques, microbes are engineered to produce vital therapeutic compounds, including antibiotics, vaccines, insulin, hormones, and monoclonal antibodies. Microbial systems offer a cost-effective and scalable method for manufacturing complex biologics with high precision and purity. For example, Escherichia coli is commonly used to produce recombinant insulin, while Saccharomyces cerevisiae (baker's yeast) is employed in vaccine development. Because it makes it possible to treat a variety of illnesses in a safer and more efficient manner, microbial biotechnology is essential to modern medicine. (Jimenez, L. (2004).

4. Future Prospects

The future of microbial biotechnology is poised for significant advancements, driven by the convergence of synthetic biology, artificial intelligence, and high-throughput omics technologies. With the growing need for sustainable alternatives to petrochemical-based industries, microbial platforms will play an increasingly critical role in the development of green technologies and circular bio economies. Engineered microbial consortia and microbiome manipulation are expected to revolutionize fields such as personalized medicine,

precision agriculture, and climate-resilient food production (Al-Sulaimani, H., et al. (2011). The use of CRISPR-Cas systems and next-generation genome editing tools will further enhance our ability to design microbes with tailored metabolic pathways for producing complex pharmaceuticals, biofuels, and bioplastics. Meanwhile, AI-powered bio foundries will streamline microbial strain development, reducing time and cost in bioprocess optimization. In the pharmaceutical sector, novel microbial-based vaccines, biosimilars, and therapeutic proteins will continue to emerge, improving access to advanced healthcare solutions. Looking ahead, interdisciplinary collaboration among microbiologists, bioengineers, data scientists, and industrial stakeholders will be essential to unlock the full potential of microbial biotechnology. As global challenges such as antimicrobial resistance, climate change, and food insecurity intensify, microbes will undoubtedly be at the forefront of the next generation of biotechnological innovation (Bhatia, S. K., et al. (2018).

Conclusion

Microbial biotechnology has emerged as a transformative force across a wide array of industries, offering innovative, efficient, and sustainable solutions through the exploitation of microorganisms. From ancient fermentation processes to modern applications in pharmaceutical production, enzyme technology, biofuel synthesis, and environmental remediation, microbes have consistently proven to be indispensable biological tools. The development of microbial cell factories, driven by breakthroughs in genetic engineering, systems biology, and synthetic biology, has greatly expanded the potential of microorganisms to produce complex and high-value compounds at industrial scales. The integration of omics technologies and artificial intelligence is further accelerating the pace of innovation, allowing for more precise microbial strain design and process optimization. As global industries continue to shift towards greener and more circular economic models, microbial biotechnology stands at the forefront of this transition—offering scalable, cost-effective, and environmentally friendly alternatives to traditional chemical and industrial processes. Continued research, investment, and interdisciplinary collaboration will be essential to fully harness the potential of microbes in addressing critical challenges related to health, energy, environment, and food security.

DEVELOPMENT OF MARINE-BIODEGRADABLE FILM FOR ENVIRONMENTAL SUSTAINABILITY

Nametha N, Suhashini V, Mrs. R.Kiruba
Department of Biotechnology, PSGR Krishnammal College for Women, Coimbatore.

Abstract
Plastic pollution in the ocean is a significant environmental threat, impacting marine life and disrupting ecosystems. In response, the development of marine-biodegradable films made from renewable natural resources presents a promising alternative to conventional plastics. This study explores the synthesis of biodegradable films from biopolymers cellulose, starch, and pectin combined with polyvinyl alcohol (PVA) to enhance flexibility and strength. The films are designed to degrade safely in marine environments, offering strength during use but breaking down after disposal. The degradation time and physical properties of the films were analyzed in saltwater, showcasing their potential to reduce plastic waste and support long-term environmental sustainability.
Keywords: Marine Environment, Biodegradable Film, Biopolymers, Synthetic Polymer, Sustainable Alternatives, Marine Pollution.

Introduction
Plastic pollution has become a major global environmental challenge, particularly in marine ecosystems. Traditional plastics take centuries to degrade and are harmful to marine organisms, disrupting the food chain. This issue has prompted research into developing sustainable alternatives, such as marine-biodegradable films. These films, which are made from renewable or natural resources, offer a solution to the growing problem of plastic pollution. Biodegradable films, unlike conventional plastics, break down in seawater without leaving harmful residues, making them an environmentally friendly alternative. This paper discusses the synthesis of a marine-biodegradable film composed of cellulose, starch, pectin, and polyvinyl alcohol (PVA), focusing on their physical properties and degradation behavior in saltwater.

Literature Review
Several studies have shown that plant-based materials are ideal candidates for bioplastic production. Tamarind seed starch has been recognized for its excellent film-forming capacity and biodegradability (Bora & Rathi, 2020). Similarly, banana leaf fiber, rich in cellulose, improves tensile strength and reduces water absorption, acting as a natural reinforcement in biocomposites (Abraham et al., 2016). Pectin, a polysaccharide used in edible films, offers biodegradability and enhances barrier properties (Nisar et al., 2019). Polyvinyl alcohol (PVA) is a water-soluble synthetic polymer known to improve the mechanical properties of biodegradable films, although it biodegrades more slowly in marine environments (Peppas et al., 2000). Combining these natural and synthetic polymers enhances the film's performance while maintaining compostability (Rhim et al., 2013). The study of saltwater degradation of these materials is particularly important for applications in marine environments, where the rapid and safe breakdown of the material is necessary for sustainability.

Methodology
The preparation of marine-biodegradable films involved the extraction of biopolymers from natural sources, including cellulose from banana leaves, starch from tamarind seeds, and pectin from orange peel. The films were then cast by blending these biopolymers with polyvinyl alcohol (PVA) and glycerol. The process involved several key steps:

Cellulose Extraction: Banana leaves were chopped, treated with ethanol, sodium hydroxide (NaOH), and sodium hypochlorite ($NaClO_2$) to extract cellulose fibers. The fibers were then dried and stored for further use.

Starch Extraction: Tamarind seeds were roasted, ground into a powder, soaked in water, and processed to extract starch.

Pectin Extraction: Dried orange peel was acidified and treated with ethanol to extract pectin.

Film Preparation:A blend of tamarind starch (54.78g), cellulose fibers (14.17g), pectin (4.72g), castor oil (5.67g), carnauba wax (5.66g), glycerol (15.00g), and lecithin (0.80g) was prepared. The components were mixed with distilled water, and the solution was homogenized and cast into films using a 10 cm × 10 cm mold. The films were dried at 40–45°C for 12–18 hours, and the physical and degradation properties were then analyzed in saltwater.

Results and Discussion

The physical properties of the marine-biodegradable films were tested for thickness, texture, and elasticity. The films demonstrated sufficient strength for practical use while showing promising degradation rates in saltwater. The degradation process was influenced by the composition of the films—cellulose and starch facilitated faster breakdown, while PVA contributed to the film's structural integrity. The addition of glycerol as a plasticizer increased the film's flexibility, making it suitable for packaging applications

Conclusion

The developed marine-biodegradable films show great potential as a sustainable alternative to conventional plastics, offering both strength and biodegradability in marine environments. By utilizing natural biopolymers combined with PVA, these films can reduce plastic waste in oceans and protect marine biodiversity. Further studies on the optimization of material ratios and degradation times could improve their practical applications, making them viable for large-scale use.

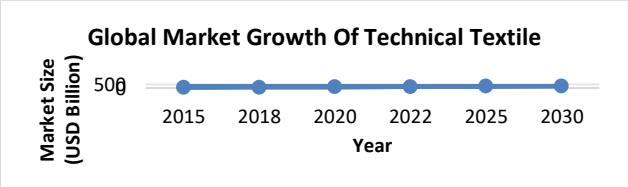
NEXT-GENERATION TECHNICAL TEXTILES: INTEGRATING NANOTECHNOLOGY, BIOPOLYMERS, AND SMART FUNCTIONALITIES FOR SUSTAINABLE INNOVATION

Safa Saleem
Research Scholar, Department of Home Science, Mother Teresa Women's University, Kodaikanal, Tamil Nadu
Dr. S. Kavitha
Professor and Head, Department of Home Science, Mother Teresa Women's University, Kodaikanal, Tamil Nadu



Abstract

The textile industry is witnessing the industry's transition, which is being driven by nanotechnology, biopolymers, smart functions, and sustainability goals. In order to redefine performance across industries like healthcare, aerospace, defense, and environmental management, this article critically examines sophisticated technical textiles that integrate cutting-edge nanomaterials, environmentally friendly polymers, and intelligent systems. Fundamental advances in textile architecture, usefulness, and sustainability are being driven by notable advancements in electrospinning, 3D/4D printing, and the creation of stimuli-responsive fibers. Recent developments in biopolymer-based fibers, biodegradable coatings, and nanofiber membranes are prime examples of the industry's transition to ecologically friendly innovation. The paper constructs a comprehensive framework for scalable commercialization by examining important scientific trends, regulatory environments, and industrial viewpoints. Analysis emphasizes how urgent it is to develop interdisciplinary teams in order to hasten the adoption of high-performance, sustainable, and innovative textile solutions.

Keywords: Nanofibers, Biopolymers, Smart Textiles, Sustainable Innovation, Technical Textiles

1. Introduction

Technical textiles, which differ from traditional textiles due to qualities like flame retardancy, antimicrobial behavior, tensile strength, and environmental adaptability, have arisen as the nexus of sustainability, improved functionality, and material science.According to market forecasts, technical textiles will be worth more than USD 350 billion by 2030, solidifying their place in vital applications ranging from protective gear and healthcare to aerospace and environmental stewardship. Notwithstanding this impressive growth trajectory, the business has obstacles that prevent widespread use, such as high production costs, inconsistent eco-friendly fiber durability, and strict regulatory requirements. Global initiatives like the United Nations Sustainable Development Goals, India's National Technical Textile Mission, and the EU Textile Strategy 2030 outline an urgent mandate for sustainable innovation, driving cohesive progress across manufacturing, application, and policy domains. This is because achieving scalable industrial applications requires targeted advancements.

2.Review

Nanotechnology in Technical Textiles: Electrospun nanofibers, which provide greater filtration efficiency, are now essential for medical PPE, air filtration, and wound dressings. Advanced nanocoatings provide qualities like UV resistance and stain repellence, while the combination of graphene, carbon nanotubes, and nanocellulose greatly improves conductivity, hydrophobicity, and antibacterial activity. The development of self-cleaning textile surfaces, made possible by photocatalytic nanoparticles, prolongs product life cycles and reduces maintenance expenses. Additionally, when strategically included into fabrics, nanosilver has strong antibacterial properties that are especially appreciated in athletics and uniforms, raising consumer confidence and sanitary standards.

Figure 1: Applications of nanotechnology in textiles

Eco-friendly fibers and biopolymers: As alternatives to petrochemical-based fibers, polylactic acid (PLA), polyhydroxyalkanoates (PHA), starch-based polymers, and chitosan are becoming more popular. These biopolymers are used in protective apparel, packaging, and biomedical fabrics because they are biodegradable and biocompatible. Strength and durability are increased by blending with hemp and cotton. Studies on lifecycle assessments emphasize their contribution to the development of circular economy models. Additional sustainable options are being made available by developments in the manufacturing of spider silk proteins and bioengineered cellulose fibers. These cutting-edge fibers are ideal for high-performance applications in outdoor gear and apparel because of their remarkable tensile strength and lightweight nature. Additionally, natural materials like bamboo and organic cotton are seeing a return in popularity due to their inherent antibacterial qualities and minimal environmental effect.Water-efficient production techniques and environmentally friendly dyeing technologies are making these materials more appealing. In line with consumer demand for ethical and environmentally friendly products, industry partnerships and research projects highlight the significance of openness in sourcing and processing.

Comparison of Biopolymers: Sources, Properties, and Applications:-

Biopolymer	**Source**	**Biodegradability**	**Mechanical Strength**	**Applications**
Polylactic Acid (PLA)	Corn, sugarcane	High (industrial composting)	Moderate (brittle without blending)	Packaging, medical textiles, apparel blends

Polyhydroxyalkanoates (PHA)	Bacterial fermentation	Excellent (soil & marine)	Good tensile properties	Medical implants, wound dressings, PPE
Chitosan	Crustacean shells	Biodegradable, antimicrobial	Limited (needs blending)	Wound healing, drug delivery, antimicrobial coatings
Starch-based polymers	Corn, potato, tapioca	Biodegradable (compostable)	Low (needs reinforcement)	Disposable textiles, packaging
Nanocellulose	Plant biomass	Biodegradable	Very high strength-to-weight ratio	Filtration membranes, smart textiles

Smart Functionalities: Sportswear with smart textiles is being used to optimize performance and give athletes real-time biometric feedback. Fabrics can improve patient care in the healthcare industry by delivering medication and monitoring vital signs. Fashion-specific programmable textiles also give protection from changing weather conditions and express individual style while adapting to environmental changes. In order to seamlessly integrate everyday wear with digital life, research is also being done on designing textiles that can interface with smart gadgets. Partnerships between fashion designers and IT specialists will probably open the door for new products that combine functionality and visual appeal as the market for smart textiles grows.

Manufacturing and Hybrid Technologies: By providing fine control over porosity and adaptable structures, 3D and 4D printing are transforming production. By facilitating quality control and predictive maintenance, the incorporation of AI and machine learning into manufacturing processes is increasing productivity. The development of future smart factories is made possible by these technologies, which enable creative design iterations and real-time data analysis.

Furthermore, bio-based and sustainable materials that preserve performance criteria while lowering their environmental impact are being introduced via advances in material science. A circular economy is supported by the creation of recyclable and biodegradable alternatives, which guarantee creative and ethical production practices. As these tendencies develop, cooperation between businesses and academic institutions becomes more and more important, encouraging interdisciplinary ways to address difficult problems and advance industrial skills.

Regulatory and Industry Views: Adoption is contingent upon adherence to regulations like FDA, REACH, and ISO. Sustainable adoption is promoted by initiatives like the EU's Green Deal and India's Textile Mission 2030. Innovation in sustainable practices is promoted via collaborations between research institutions and industry participants. The goals of initiatives centered on the concepts of the circular economy are to improve resource efficiency and reduce waste. Businesses are adopting greener methods as a result of growing consumer knowledge and preference for sustainable products. Putting an emphasis on environmental responsibility and transparency, certification labels and eco-friendly branding have a big impact on consumer choices.

4. Findings

The technical textile industry is growing quickly, as evidenced by strong technological innovation, fast market expansion, and intensifying sustainability initiatives, according to the convergent methodology. With Asia-Pacific accounting for 47% of global production and India quickly narrowing the domestic output gap with the help of the NTTM, the worldwide market is expanding rapidly. By 2030, market values are expected to rise from about USD 26 billion in 2024 to USD 40–45 billion. The growing variety of applications in PPE, smart wearables, and industrial textiles supports these developments.

With electrospun biopolymer mats and nanofibrous hydrogels improving biological integration and infection control, nanofiber technologies are opening up new possibilities for medical textile applications, such as antimicrobial surfaces and wound healing. A new era of interactive textile goods has begun with the integration of AI and IoT into smart textiles, which offer wireless connection, environmental adjustments, and real-time physiological monitoring. With Adidas achieving 99% recycled polyester use and Reliance Industries introducing the biodegradable GreenGold fiber line, sustainability is becoming more and more important. These developments highlight industry moves to circular material cycles. Manufacturing innovations have reduced environmental impacts and improved supply chain accountability by introducing blockchain-based material traceability systems and digitally optimized, zero-waste production.

By 2030, future advancements are expected to include self-healing nanomaterial fabrics that increase product lifespans and functionality, AI-driven adaptive clothing systems, and body energy harvesting involving piezoelectric and thermoelectric textiles. These technologies hold the potential to revolutionize consumer markets, healthcare, defense, and environmental management. This comprehensive approach demonstrates how technological and smart textiles are rapidly moving from specialized research to scalable, environmentally friendly commercial solutions, with the potential to revolutionize a variety of international industries by 2030.

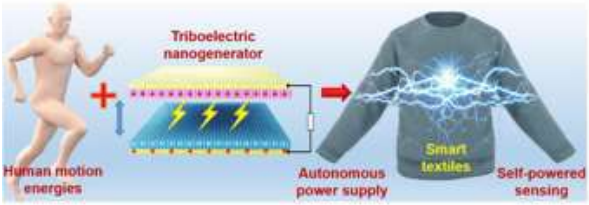


Figure 2: Schematic representation of smart textiles powered by triboelectric nanogenerators

Conclusion

Nanotechnology, biopolymers, and smart systems come together to create next-generation technical textiles. They are used in the fields of environmental protection, aerospace, defense, and healthcare. Although issues with scalability, affordability, durability, and regulatory compliance still exist, trends in industry acceptance show a growing dedication to sustainable techniques. Predictive modeling and AI-enabled material design should be the top focus of future research as well as industry.

- Supply chain transparency through blockchain integration.
- The creation of bioelectronic clothing with energy systems integrated into it.
- Frameworks for the circular economy that encourage reuse and recycling.
- Hybrid manufacturing that blends smart factory models, 3D/4D printing, and electrospinning. Technical textiles will change industries and influence global sustainability pathways throughinterdisciplinary collaboration.

ACOUSTIC TEXTILES AS A TOOL FOR ENHANCING HOME ACOUSTIC COMFORT

Ms.Sindu Francis
Head, Department of Costume and Fashion Designing,
Nirmala College of Arts and Science, Thrissur
Ms.C Anisha
Assistant Professor, Department of Costume and Fashion Designing,
Nirmala College of Arts and Science, Thrissur

Abstract
Acoustic textiles, which include feel drapes, wrapped in fabric panels, concealing curtains, and fabric-covered systems, are becoming more and more popular as ways to enhance noise insulation in residential spaces. Reverberation and poor speech intelligibility are widespread problems in homes due to increasing density in cities, open- concept layouts, and the presence of reflective surfaces. These concerns have a direct impact on communication, well-being, and the perception of interior quality. Textiles have several uses, including the capacity to absorb sound and versatility in terms of appearance, positioning, and incorporation into everyday environments. Their function goes beyond ornamentation; they actively support acoustic performance while maintaining or improving the interior design language.

This study examines the absorbent properties of acoustic textiles, compiles the data on how well they work in homes, and highlights important material and design factors. The results show that when strategically chosen and used, textiles can significantly cut down on mid-to-high frequency reflections and reverberation duration, but their ability to absorb low frequencies and insulate against sound is still restricted. Results are greatly influenced by broader factors such fabric density, thickness, positioning, fire safety, and upkeep. Future directions, such as the creation of mixed systems, responsive textiles, and a more thorough assessment of occupier satisfaction, are mentioned along with helpful suggestions for designers, developers, and residents for optimal use.

Keywords: Acoustic textiles, Sound absorption, Residential acoustics, Acoustic comfort, Interior design

1. Introduction

Acoustic comfort, together with well-known factors like thermal insulation, natural light, and ventilation, have emerged as a top design issue as population density rises and open-plan living takes over as the predominant trend in modern housing. Prolonged resonance, undesired echoes, and diminished voice intelligibility are all signs of deteriorating acoustics in residential environments, which can have a detrimental impact on relaxation, communication, focus, and general wellbeing. The prevalence of vast, sparsely furnished areas that lack the natural diffusion and absorption that smaller rooms and heavy draperies historically gave rise to, as well as contemporary interior materials like glass, cement, and hardwood which radiate sound rather than absorb it, exacerbate the problem.

The way noise reacts with materials inside an area largely determines the soundproofing of the interior environment, even while conventional building techniques and insulation tactics successfully reduce airborne noise transmission between homes. This has highlighted the use of diffuse and absorbent materials that can be incorporated into daily life without necessitating significant structural adjustments. An attractive approach is provided by textile-based solutions, which range from feeling hangings and curtains to fabric-covered panels and combinations of materials. They enable homeowners and designers to enhance interior aesthetics and improve speech clarity and reverberation by combining acoustic performance

with visual flexibility, cost, and ease of installation. Acoustic fabrics are becoming a more significant instrument in the creation of peaceful and nutritious living spaces because of their dual purpose as ornamental and functional parts.

2. Literature Review

2.1Functions

Sound absorption using permeable fibrous frameworks is the main purpose of acoustical textiles. Viscosity and thermal transfer cause energy to be lost as heat when waves of sound enter open- weave textiles or fiber backings like felt, mineral wool, PET felt, or foams. According to Kobiela-Mendrek et al. (2022), this process makes textile absorbers especially efficient in the mid- to high-frequency ranges (500–4000 Hz), which are crucial for understanding language in residential situations. By adding air passages behind panels or thickening the material, low-frequency absorption can be improved.

The frequency-modulated absorption of sound coefficient (α) and the composite Noise Reduction Coefficient (NRC), which offer a consistent indicator of efficacy, are commonly used to evaluate performance. When made from natural or recycled fibers, textile-based absorbers can provide additional advantages beyond noise control, such as thermal insulation, light diffusion, aesthetic enhancement, and sustainability benefits (ShowTex, 2021). Textiles are a desirable option for striking a balance between cost, performance, and design flexibility in household settings because of their many uses.

2.2 Evidence from Literature and Industry Tests

According to both field and laboratory tests, when fabric systems are applied to a suitable percentage of wall or ceiling surface (often 10–30%), they can significantly reduce reverberation times (RT60) in living rooms, bedrooms, and media rooms. In the 500–4000 Hz range, felt wool and panels covered in thick fabric frequently exhibit high α values, whereas curtains lessen mid- and high-frequency reflections but are less successful at obstructing outside noise.

Depending on manufacturing and backing, commercial acoustic textiles and panels report NRC values ranging from approximately 0.4 to 0.95. Empirical research conducted in residential environments highlights that the cumulative benefits of a combination of treatments curtains, carpets, upholstered furniture, and panels are higher than those of any one intervention alone.

2.3 Types of Acoustic Textile Solutions for Homes

- **Acoustic drapes and curtains:** Thick, multi-layered drapes that shield windows and thin walls from reflections. Although they offer minimal aerial sound shielding, they aid in improving seclusion and reducing echo (Direct Fabrics).
- **Fabric-wrapped panels:** Panels having fibrous cores (melamine, mineral wool, or PET) that are wrapped in acoustically transparent materials and installed on walls or ceilings to address major reflecting sites are known as fabric-wrapped panels. They provide flexible design and great absorption.
- **Decorative textiles and felt hangings:** PET felt or wool panels intended for visual appeal and low-frequency absorption; frequently used as staircase or room dividers in areas where reverberation is an issue.
- **Soft furnishings and upholstered furniture:** Cushions, rugs, and sofas all aid in total absorption and have to be included in the acoustic method.

3. Methodology

Using a combination of laboratory data analysis, home case studies, and literature review, this study employs a mixed-method approach. Multi-layered curtains, fabric-wrapped panels with mineral wool or PET felt, felt hangings made of wool, and typical soft furnishings like carpets and upholstery are all examples of acoustic materials.

Absorption coefficients are determined via laboratory experiments based on ISO 354 reverberation chamber procedures and impedance tube measurements. Measurements of reverberation time (RT60) in furnished living rooms, bedrooms, and home offices both before and after the installation of textile solutions are part of field research (Matsuda, 2017).

4. Results

Standardized testing and domestic applications were used to evaluate the performance of acoustic fabrics. NRC values for fabric-wrapped panels evaluated in a lab ranged from 0.70 to 0.95, contingent on underlying air gap and thickness. Although their efficacy at low frequencies was restricted, acoustic curtains showed 20–35% decreases in mid-frequency reverberation.

According to field case studies, felt hangings in stairwells greatly improved speech intelligibility by lowering reverberation time (RT60) from 1.4 to 0.8 seconds. The combined effects of wall-mounted panels, carpets, and curtains in living rooms and home offices were more beneficial than the effects of each treatment alone.

Table 1. Example absorption performance of acoustic textiles

S. No	Material	NRC Range	Frequency Effectiveness
1	Fabric-wrapped panels	0.70–0.95	Mid–high frequencies
2	Acoustic curtains	0.40–0.65	Mid frequencies
3	Felt wall hangings	0.50–0.80	Mid–high frequencies

5. Discussion

5.1 Design Considerations and Guidelines

- **Frequency targets:** Give middle-frequency absorption (500–2000 Hz) top priority for comprehension of speech in living spaces and home offices. Use thicker panels or bass-trapping techniques for low frequencies (PMC) in home theaters or music rooms.
- **Placement and coverage:** Take care of the back wall behind the speakers, the side walls, and the ceiling as the main reflection locations. With strategically placed panels, 10–20% wall coverage can significantly lessen slap echoes in compact spaces. Where windows create strong shadows, curtains can aid.
- **Material selection:** Choose acoustically transparent face cloths instead of thick, impermeable ones. While natural fibers like wool felt mix performance and sustainability, mineral wool, PET felt, or acoustic foam offer consistent performance (delius.de).
- **Air gap and thickness:** Low-frequency absorption is enhanced by a back air gap and greater thickness. In low-to-mid ranges, an air-cavity 50–100 mm panel outperforms a thin cloth alone.
- **Indoor air quality and fire:** Choose materials with low volatile organic compounds (VOCs) and suitable fire ratings (ASTM/Class A or comparable).
- **Aesthetics and modularity:** Modular designs enable phased installation and relocation, and textile panels can be changed in terms ofcolor, pattern, and shape .

5.2 Practical Applications

- **Open-plan living spaces:** Soft furnishing clusters and large wall-mounted fabric panels suppress chatter and lower overall noise levels.
- **Home offices:** Teleconferencing clarity is enhanced by panels at lateral reflection spots and behind the monitor. Curtains and rugs improve the sound quality of remote meetings by reducing echo.

- **Media rooms and practice spaces:** Combine bass traps, ceiling clouds, and thick panels in media rooms and practice areas. Textiles make for aesthetically beautiful cladding.
- **Duplex connections and staircases:** Vertical panels or felt banners can be used to cut down on reverberation and noise transfer.

5.3 Restrictions and misunderstandings

Acoustic fabrics lessen reverb and echoes, but they don't completely filter out loud outside sounds (Direct Fabrics). At low bass frequencies, porous absorbers are limited unless they are thick or used in conjunction with bass traps (PMC). In-situ performance may not be readily predicted by laboratory NRC ratings; room conditions and positioning are crucial (Quiet Curtains).

5.4 Material Innovation and Environmental Responsibility

Research on engineered textile structures for tailored absorption and acoustic cores made of natural and recycled fibers (wool, hemp, and recycled PET) is progressing. According to ScienceDirect and the Textile & Apparel Management Journal, these materials seek to blend acoustic performance with circularity and reduced embodied carbon. When specifying, designers should also consider durability and lifecycle consequences.

6. Suggestions for Homeowners and Practitioners

- Start with an acoustic evaluation (subjective listening or basic RT60).
- In living and working areas, give priority to mid-frequency absorption; if low-frequency issues are evident, utilize thicker panels or bass treatment.
- Utilize textile components with many uses, such as curtains, separators, and ornamental panels, to blend style with functionality.
- Verify VOC and fire certifications, and take into account designs that are detachable or recoverable for upkeep and reuse.

Conclusion

A flexible, efficient, and aesthetically pleasing method of enhancing the acoustic comfort of a home is the use of acoustic textiles. Curtains, fabric-wrapped panels, felt hangings, and soft furnishings can all greatly minimize reverberation and improve voice clarity, especially in the mid-to-high frequency range, according to evidence from both laboratory testing and domestic applications. Although they are not a replacement for soundproofing or bass absorption, these materials offer a number of advantages when used thoughtfully on furniture and surfaces.

Acoustic textiles will become more and more important in creating home environments that are more comfortable and healthy as sustainability and design flexibility improve. Future studies should investigate smart acoustic textiles, hybrid systems, and long-term occupant satisfaction in practical environments.

SMART WEARABLE AND TEXTILES: SENSOR TECHNOLOGY, FUNCTIONALITY, AND APPLICATIONS

Ms. Gayathri K S, Ms. Jaya Baju, Ms. Cija K G
Assistant Professor, Department of Costume and Fashion Designing,
Nirmala College of Arts and Science

Abstract

Smart textiles, also known as intelligent fabrics or e-textiles, represent a significant innovation in wearable technology and materials science. To enable real-time data acquisition, monitoring, and interactive capabilities, the advanced textiles embed electronic materials e.g., sensors, actuators, and microcontrollers within the textile structure. Smart textiles, which integrate textile engineering with sensor technology, create new possibilities in several fields such as fashion, sports, medicine, and the military. Smart textiles permit continuous, non-invasive monitoring by tracking physiological information such as respiration, movement, temperature, and heart rate. Focusing on the sensing applications of physiology, this research considers design, structure, production techniques, and performance measurement of smart textiles. Robustness, signal accuracy, washability, and ergonomics of comfort of various sensor integration methods such as weaving, embroidery, and printing are analysed. Their long-term use and mechanical flexibility are also analysed. The paper concludes by laying out current limitations and discussing future challenges, including power supply integration, mass production, and privacy in data. There is a substantial and growing potential for smart clothing to transform wearable systems.

Keywords
Smart Textiles, E-textiles, Wearable Technology, Sensors, Conductive Fibres

1. Introduction

Smart clothing merges the traditional characteristics of fabrics with the high-tech functionality of advanced electronics. With wearable technologies spreading rapidly, there is increasing need for unobtrusive, flexible, and washable systems that can monitor environmental and physiological information. These clothes incorporate sensors that sense parameters like heart rate, temperature, movement, and strain and transform them into electrical signals for analysis.

Initially introduced in Japan in 1989, smart textiles have come to sense, respond to, or adjust according to their environments. Categorized as passive, active, or ultra-smart, they could be created for wearable or non-wearable purposes. Electronic textiles (e-textiles) include woven semiconductors or laminated electronics and provide light and flexible solutions for use in healthcare, sports, and interior design. Some examples are soft circuits and conductive clothes. Not every intelligent textile needs electronics—some, such as thermo-chromic fabrics, react to stimuli without having devices implanted. Advances in nanotechnology, embedded systems, and wireless communication have made these materials communicate through fibres, yarns, and fabrics, enabling smooth interconnectivity.

Developed for ease and flexibility, smart textiles enable constant, non-intrusive data acquisition. With the increasing focus on health monitoring and the spread of the Internet of Things (IoT), interest and research in this area have increased. This paper provides an analysis of the different smart textile technologies, the materials and integration methods used, and their performance in practical applications.

2. Materials and Methods

2.1 Materials

2.1.1 Conductive Fibres and Yarns

In smart textiles, electrical functionality is based on conductive fibers and yarns. Carbon fibers, stainless steel strands, and silver-coated nylon are frequently cited examples. These materials maintain the softness and suppleness of traditional textiles while offering electrical conductivity. Conductive yarns, as opposed to stiff wires, can be knitted, woven, or embroidered into textiles, enabling them to stretch and flex without losing their functionality. Their main functions include connecting sensors to processing units, integrating circuits, and establishing conductive channels.

2.1.2 Base Fabrics

The wearable and structural part of smart textiles are the foundation fabrics. The comfort, durability, and versatility of materials like spandex, cotton, and polyester make them popular. Cotton's skin-friendliness and breathability make it appropriate for everyday wear and medicinal purposes. Spandex adds elasticity and flexibility, which are essential in sports and fitness applications, while polyester offers strength and resistance to wrinkles. When combined, these materials make sure that smart textiles are long-lasting, lightweight, and comfortable.

2.1.3 Sensors

The active elements incorporated into textiles that allow for the monitoring of chemical, biological, or physical factors are called sensors. Piezoresistive strain sensors for posture and motion detection, ECG electrodes for cardiac signal recording, and temperature sensors like NTC thermistors are examples of common sensors. Through methods like weaving, printing, or embroidery, these sensors are frequently incorporated straight into textiles. Smart textiles are useful for healthcare, sports, and military applications because of their ability to record data on bodily activity, environmental changes, or medical issues.

2.1.4 Processing Units

The control centers of smart textiles are processing units, which provide communication, processing, and data gathering. Because of their small size, programmability, and compatibility with wireless technologies like Bluetooth and Wi-Fi, microcontrollers like the Arduino Nano and ESP32 are frequently used. After processing the signals from the sensors, these units send the data to computers or cellphones, among other external devices. They are ideal for wearable applications due to their compact size and low power needs.

2.1.5 Power Sources

In order to power sensors and processing units in smart textiles, power sources are necessary. Because they are portable and lightweight, thin-film and flexible lithium-ion batteries are widely used. Furthermore, energy-harvesting technologies like solar textiles, piezoelectric materials, and turboelectric generators are becoming more and more popular for sustainable power supplies. These systems lessen reliance on traditional batteries by producing energy from mechanical stress, bodily movements, or solar radiation. By incorporating these power solutions, smart textile systems are guaranteed to run continuously and independently.

2.2 Methods

2.2.1 Integration through Weaving and Knitting

Conductive yarns are included into the knitting or weaving process as one of the basic techniques for creating smart textiles. This method creates fabrics with incorporated electrical channels by weaving conductive fibers, like stainless steel yarns or nylon coated in silver, with conventional textile fibers. This method maintains the fabric's elasticity, softness, and durability while enabling the smooth integration of electronic capabilities. It is frequently utilized in the production of flexible, machine-washable smart clothing.

2.2.2 Coating and Printing

The application of conductive coatings or inks to fabric surfaces is another method that is frequently used. Conductive materials that function as sensors, electrodes, or circuits are deposited in precise patterns using techniques like screen printing and inkjet printing. Usually, conductive inks with graphene, carbon, or silver nanoparticles are utilized. This strategy is beneficial because it enables the economical and large-scale manufacturing of smart textiles with personalized sensor designs, which makes them appropriate for fitness wearables and healthcare monitoring patches.

2.2.3 Sewing and Embroidery

Conductive threads are used in sewing and embroidery techniques to directly stitch practical patterns onto textiles. Electrical circuits, linkages, or sensor arrays can be formed by these patterns. Without changing the fabric's overall structure, embroidery provides design flexibility and permits the localized integration of sensors. It is especially helpful in applications like smart fashion clothing and interactive textiles that demand both utility and visual appeal.

2.2.4 Hybrid Integration

Textiles and flexible electronic components like printed circuit boards (PCBs), snap connectors, or adhesive-mounted sensors are combined in hybrid integration. This technique allows for sophisticated features like data processing, wireless connection, and energy storage by bridging the gap between conventional electronics and textiles. By enabling removable or interchangeable modules, hybrid systems improve maintenance and durability while broadening the scope of applications in the industrial, military, and healthcare domains.

3 Tests Performed

Washability Test

Machine wash cycles ranging from 10 to 20 were applied to smart fabrics. Before and after every cycle, conductivity and sensor outputs were evaluated to evaluate durability.

Flexibility and Bending Test

To simulate wear, fabrics were stretched and bent 1,000 times. To assess mechanical durability, electrical continuity and sensor accuracy were examined.

Sensor Calibration and Accuracy Test

Accuracy was verified by comparing textile-embedded sensors with commercial equipment (such as heart rate monitors) during rest and exercise.

User Comfort Test

After wearing the clothing for extended periods of time, participants completed surveys to rate its wearability, breathability, and comfort.

4. Results and Discussion

4.1 Washability

Fabrics made with conductive yarn demonstrated good endurance, retaining over 85% of their conductivity after ten wash cycles. On the other hand, printed sensors showed inadequate wash resistance and lost accuracy after just five cycles.

4.2 Flexibility and Durability

Strong mechanical endurance was indicated by the woven electrical fibers' little resistance change (<10%) even after 1,000 bending cycles. However, printed sensors showed increasing resistance and microcracks, indicating less long-term flexibility.

4.3 Sensor Performance

The medical application of silver-coated yarn ECG electrodes was validated by the production of signals that were comparable to those of commercial equipment. Reliable

functionality was confirmed by strain sensors that showed a linear response with less than 5% error and fabric-integrated temperature sensors that maintained accuracy within ±0.5 °C of standard sensors.

4.4 User Comfort

The materials were deemed pleasant and non-intrusive by more than 80% of users, indicating that they are suitable for daily usage. The necessity for more seamless integration in future designs was brought to light by minor discomfort at sensor junctions.

Conclusion

Smart fabrics are an exciting crossroads of electronics and textile science. When combined with sensor technology, smart fabrics can offer real-time physiological information, and for that reason, they have great potential for healthcare, fitness, and the military. Our analysis indicates that embroidered or woven conductive elements provide optimal durability and comfort. Issues still exist in washability, power control, and data security. Further studies must aim at scalable manufacturing techniques, biodegradable electronics, and wireless communication integration to drive the diffusion of smart textiles.

In addition, enhancing the energy efficiency of embedded systems and creating self-powered or energy-harvesting fabrics will be important for long-term application. Interdisciplinary collaboration between textile engineers, material scientists, and electronics designers is necessary to guarantee innovation and usability. User-cantered design will be significant in creating comfort, wearability, and user acceptability. Integration into cloud-based platforms and artificial intelligence for data processing and predictive analytics will continue to push the boundaries of smart textiles. As the technology advances, regulation standards and certification schemes will also have to advance to guarantee product safety, compatibility, and user confidence in the use of smart textile technologies.

ENHANCING PORTFOLIO AESTHETICS THROUGH AI-BASED MOOD BOARDS

Ms. Linsha Ganesh T, Ms. Tincy Mohan
Assistant Professor, Department of Costume and Fashion Designing,
Nirmala College of Arts and Science, Thrissur

Abstract

Mood boards are vital tools in creative industries, serving as visual frameworks for storytelling, concept development, and portfolio presentation. By combining images, colors, textures, and typography, they communicate moods, design directions, and thematic inspiration while showcasing a creator's process beyond the final product. Traditionally, however, mood boards have been manually curated—a time-consuming and resource-intensive approach limited by the designer's exposure and imagination.

Advancements in Artificial Intelligence (AI) have transformed this process, making mood board creation more efficient, data-guided, and customizable. AI systems can analyze project briefs, detect trends, and generate or recommend visuals, color palettes, and layouts aligned with specific themes. Machine learning enables personalization, while generative AI tools such as MidJourney, DALL·E, and Adobe Firefly expand creative possibilities through original content generation. As a result, mood boards are evolving into dynamic, interactive tools that save time while enhancing creativity. This paper explores how AI automates, enriches, and innovates mood board design, particularly in portfolio development, while addressing its benefits, challenges, and future scope.

Keywords

Mood boards, Artificial Intelligence, Generative Design, Portfolio Development, Creative Process.

Introduction

Mood boards are visual collages that combine colors, textures, images, and typography to express a specific concept, mood, or style. By translating abstract ideas into tangible visual narratives, they serve as powerful communication tools in creative industries. In professional portfolios, mood boards highlight not only a designer's aesthetic choices but also their creative thinking, problem-solving skills, and design philosophy. They are particularly valuable in fields where storytelling and visual identity are central, such as fashion, interior design, architecture, marketing, and graphic design.

Despite their importance, traditional mood boards pose challenges. Designers spend considerable time sourcing, classifying, and organizing materials from diverse resources images, libraries, publications, or physical samples. While this manual process allows experimentation, it is often time-intensive, resource-dependent, and limited by the designer's personal exposure, making originality and consistency difficult to maintain.

AI technologies are addressing these challenges through automation, generative content, and personalized curation. AI systems can analyse briefs, extract keywords, and identify design patterns to recommend or generate relevant visuals, palettes, and layouts. Generative AI tools like DALL·E, Mid-Journey, and Adobe Firefly extend creative possibilities by producing entirely new graphics, while machine learning algorithms adapt to user preferences, enabling mood boards that are more customized, dynamic, and adaptive.

2. Role of AI in Mood Board Creation

AI brings speed, intelligence, and creativity into mood board design, shifting it from manual effort to a smarter, data-driven process. Its role can be explained through five main functions:

2.1 Image Recognition and Classification

AI can “see” and analyze images using computer vision. It detects colors, patterns, textures, and styles, then automatically tags and organizes them. For example, Google Vision or Pinterest Lens can identify whether an image shows “earthy tones” or a “minimalist style,” helping designers quickly sort and search visuals for their boards.

2.2 Generative AI for Visual Creation

Generative AI goes beyond finding images, it creates new ones from text prompts. Tools like Mid-Journey, Stable Diffusion, or DALL·E can turn descriptions such as “sustainable fashion with natural fabrics” into unique visuals. This gives designers original content that fits their exact theme, instead of relying only on existing resources.

2.3 Automated Curation and Recommendation

AI acts like a smart assistant, suggesting images, fonts, and palettes based on keywords or references. For instance, Adobe Firefly and Figma AI analyze a project brief and generate design-ready recommendations. This saves time and ensures mood boards stay consistent with the portfolio’s creative direction.

2.4 Style Transfer and Adaptation

Style transfer lets AI apply the look of one image like brush strokes, textures, or color tones to another. This helps unify different visuals into a consistent style. For example, an architect could apply a “modern minimalism” look across multiple references, making the mood board cohesive.

2.5 Personalization

AI learns from user preferences. If a designer often chooses bold colors or minimalist layouts, the system adapts and suggests similar options. Over time, this personalization creates mood boards that not only match project goals but also reflect the designer’s unique identity, making portfolios stand out.

3. Methodology

AI-powered mood board production follows a methodical workflow where intelligent automation supports human creativity. This approach combines generative models, recommendation engines, picture analysis, and text interpretation into a single, efficient system. The following are the steps:

3.1 Input Stage

The designer starts the process by contributing keywords, a project brief, or reference images. The mood board's conceptual framework is defined by these inputs. For instance, a fashion designer might upload sample textures and sketches or type in phrases like "lightweight fabrics, pastel colors, minimalist summer collection." Because it directs the AI system in choosing and producing content that is in line with the designer's creative direction, the quality of the input is vital.

3.2 AI Processing

The AI system applies several levels of analysis and generation after receiving the input:

- **NLP, or natural language processing:** Interprets input that is text-based, like descriptive briefs or keywords. NLP assists the system in comprehending abstract ideas such as "modern luxury" or "calm atmosphere" and converting them into appropriate visual recommendations.
- **Computer Vision:** Analyzes uploaded photos to find important characteristics like objects, colors, textures, and shapes. This guarantees that the mood board appropriately incorporates reference images.
- **Recommendation Engines:** Use internet repositories or design databases to recommend fonts, color schemes, and images. Contextual analysis serves as the

foundation for recommendations, guaranteeing that they are consistent with the project's concept.

- **Generative AI:** Creates original material when needed. For example, generative models like Stable Diffusion or MidJourney can produce a unique depiction of a futuristic skyscraper or a fabric texture that isn't easily found in databases in an instant.

3.3 Output Stage

The AI creates a preliminary mood board layout after processing. Usually, this output consists of carefully chosen images, color schemes, suggested typography, and potential layout configurations. The designer can clearly see the project's desired mood or topic thanks to the board's presentation as a unified design concept.

3.4 Feedback Loop

Human assessment and improvement are part of the last phase. After seeing the AI-generated mood board, the designer accepts the pertinent aspects and removes or changes those that don't fit their concept. A feedback loop is produced by this iterative process, in which the AI system gains knowledge from the designer's preferences. The algorithm adjusts over time, making recommendations that are increasingly precise and tailored to the user.

4. Benefits of AI-Powered Mood Boards

- **Efficiency:** By automating picture search, classification, and layout, AI expedites the design process and helps designers save a significant amount of time.
- **Creativity Boost:** AI broadens the scope of inspiration beyond conventional sources by proposing novel pairings and producing original images.
- **Consistency:** AI helps portfolios retain a strong visual identity by guaranteeing a consistent style and alignment with project goals.
- **Accessibility:** The process is made more inclusive by enabling non-designers to produce professional-looking mood boards using AI tools.
- **Scalability:** Because AI can generate several variations rapidly, designers can evaluate choices and select the one that best suits their portfolio.

5. Challenges and Limitations

- **Originality Concerns:** AI-generated images may mimic or overlap with protected works, which raises questions about their validity and originality.
- **Over-Reliance on Algorithms:** Over-reliance on AI may result in designs that are repetitious.
- **Bias in Training Data:** AI recommendations may inadvertently mirror the dataset's cultural, social, or aesthetic biases.
- **Emotional Depth:** AI might find it difficult to convey nuanced feelings or innate inventiveness in design, in contrast to humans.
- **Ethical Concerns:** In AI-assisted portfolios, authorship, ownership, and intellectual property issues are still open.

6. Applications in Portfolio Design

1. **Graphic Design**: Presenting visual storytelling and mental ideas.
2. **Fashion Design**: Displaying textiles, color schemes, and seasonal ideas.
3. **Architecture & Interior Design**: Expressing material choices, textures, and spatial emotions.
4. **Marketing & Branding:** Matching mood boards to campaign objectives, tone, and brand identity.
5. **Student portfolios:** Helping students make presentations that are coherent and visually appealing.

7. Future Scope

1. **Immersive Mood Boards:** AI may assist in creating 3D or interactive mood boards through AR/VR integration, giving viewers a more realistic and captivating experience with design concepts.
2. **Collaborative Platforms: U**pcoming AI technologies could facilitate real-time co-creation, allowing teams, clients, and designers to collaborate easily on shared mood boards.
3. **Emotion Recognition:** By analyzing how images arouse feelings, AI could assist designers in choosing colors and images that better engage audiences.
4. **Hyper-Personalized Systems:** Using advanced AI, mood boards can be created for certain audiences, such as tailoring a portfolio to a client's brand identity or a recruiter's tastes.

Conclusion

AI-powered mood board generation is changing how designers think about and display their work. AI speeds up, improves intelligence, and makes the process more approachable by automating tedious processes, providing tailored recommendations, and producing original visual material. Professionals and non-designers alike can experiment with a wider variety of concepts while still being efficient and consistent thanks to it.

The intuition, cultural sensitivity, and emotional depth that human designers contribute to the creative process, however, cannot be entirely replaced by AI. When AI is employed as a cooperative partner, enhancing human creativity without displacing it, true innovation occurs. This balance will probably define portfolio design in the future, with AI serving as a co-creator that enhances design expression and makes mood boards more dynamic, immersive, and customized.

THE ROLE OF ACOUSTIC TEXTILES IN MODERN APPLICATIONS

Dr. M. Prathiba
Assistant Professor, Department of Textiles and Apparel Design
S. Iswaraya
UG Student, Department of Textiles and Apparel Design
Periyar University, Salem,

Abstract

Acoustic textiles have rapidly evolved as innovative solutions consistently shaping the realms of noise control and interior design. These textiles combine functionality with aesthetics to reduce noise pollution effectively in modern environments such as offices, schools, hospitals, and residential buildings (Research and Markets, 2023; Ekko Acoustics, 2025). Recent breakthroughs focus on sustainable materials, smart textile technologies, and modular, multifunctional systems that offer customization and adaptable acoustic management (Texpertise Network, 2025; Tranquil Global, 2024). The growing use of recycled fabrics and biodegradable fibers matches sustainability imperatives, while digital fabrication techniques have enhanced the ability to create bespoke acoustic panels and fabrics tailored to varying spatial requirements (Research and Markets, 2023). Emerging smart acoustic textiles integrated with sensors enable real-time noise monitoring and intelligent sound adaptation, particularly pertinent in dynamic indoor environments (Ekko Acoustics, 2025). Advancements in antimicrobial and fire-retardant fabric treatments further support their use in sensitive environments such as healthcare and food processing. This article provides a comprehensive review of the latest developments, application trends, and market drivers of acoustic textiles in the contemporary era, underscoring their expanding role in improving human comfort and environmental quality.

Keywords: Acoustic textiles,Noise control,Sustainable materials,Smart textiles,Interior design

INTRODUCTION

The escalating challenges associated with urbanization, open-plan offices, and public space design have heightened attention toward effective sound management solutions. Traditional acoustic materials, such as rigid panels and ceiling tiles, often impose limitations on design flexibility, installation ease, and sustainability. Acoustic textiles offer a compelling alternative by combining lightweight, flexible fabrics with sound-absorbing properties, enabling designers to incorporate visually appealing noise mitigation solutions (Texpertise Network, 2025; Ekko Acoustics, 2025). Their intrinsic fiber structure allows for efficient sound absorption by converting sound energy into heat through porous surfaces while maintaining diverse aesthetic options.Recent advancements have transformed acoustic textiles beyond simple curtains or wall panels. Technical innovations include recycled polyester and natural fibers that reduce the environmental footprint while maintaining or exceeding acoustic performance (Research and Markets, 2023). Smart textiles embed sensors for monitoring acoustic environments and controlling sound conditions dynamically, which is particularly important in healthcare, education, and corporate settings (Ekko Acoustics, 2025). Regulatory trends emphasizing indoor air quality, fire safety, and sustainability stimulate continued material innovation. Digital fabrication tools now permit intricate shapes, colors, and patterns customized to client specifications, aligning acoustic function seamlessly with architectural design (Tranquil Global, 2024). This convergence of sustainability, technology, and design positions acoustic textiles as vital components of modern built environments

APPLICATIONS AND RECENT TRENDS IN ACOUSTIC TXTILES

Sustainable Acoustic Textile Materials

The adoption of eco-friendly fibers such as recycled PET, wool, and plant-based materials supports green building standards while delivering superior acoustic dampening capabilities. Manufacturers focus on low-emission production and recyclable end-of-life products to align with circular economy principles and reduce carbon footprints (Research and Markets, 2023).Composite boards were made from bagasse, bamboo, banana, coir, and corn husk fibres at low, medium, and high densities. Their porosity ranged from 50–79%, and the damping was highest in banana and corn husk boards at low density. Sound absorption decreased as density increased, with the best performance seen in low-density banana fibre boards, which showed the highest NRC value of 0.40, making them most suitable for sound absorption(Sharma et al., 2020).

Fig. 1 a.Fibresof bagasse ,b bamboo, c banana, d coir corn hush fibre(Sharma et al., 2020)

Modular and Customized Acoustic Systems

Modular acoustic panels and textiles provide flexibility for evolving space requirements and ease of installation. Customizable shapes, colors, and patterns enable branding and aesthetics integration, making acoustic textiles functional design statements suitable for offices, classrooms, and hospitality venues (Ekko Acoustics, 2025).

Fig:2:Sound panel(Sound Management Group, 2025)

Smart Acoustic Textiles with Sensor Integration

Advances in textile technology allow embedding sensors within fabrics to gather acoustic data for real-time adjustment or monitoring. These textiles facilitate noise mapping, occupancy detection, and adaptive noise control in smart buildings, improving occupant comfort and operational efficiencies (Tranquil Global, 2024).

Multi-Functional Acoustic Solutions

Acoustic textiles increasingly serve dual roles, such as combining sound absorption with lighting fixtures or writable surfaces. These innovations optimize space usage and provide added value in collaborative workspaces and learning environments (Texpertise Network, 2025).

Antimicrobial and Fire-Resistant Treatments

Healthcare and public spaces demand acoustic textiles with added health and safety features. Antimicrobial coatings inhibit pathogen growth, and fire retardant finishes ensure compliance with strict building codes while maintaining acoustic efficacy (Research and Markets, 2023).

Natural Fiber-Based Acoustic Materials

Fibers such as jute, hemp, coir, cotton, and kenaf are widely used to produce sustainable acoustic panels. Their hollow, porous structures enable effective sound absorption (Schiavi et al., 2019). For example, kenaffiber composites have shown sound absorption comparable to commercial synthetic insulators.

Recycled Textile Acoustic Panels

Post-consumer and industrial textile waste can be processed into acoustic panels. Recycled polyester, wool, and denim have been used to manufacture sound-absorbing boards, reducing landfill waste (Asdrubali et al., 2015).

Biodegradable and Eco-friendly Composites

Biopolymer binders combined with natural fibers enhance the mechanical strength of acoustic panels. Materials such as starch, polylactic acid (PLA), and bio-resins provide structural stability without relying on petrochemical binders (Yadav&Anandjiwala, 2021).

Nanotechnology and Surface Modification

Recent research has applied nanotechnology to improve the fire resistance, moisture stability, and durability of natural fiber-based acoustic textiles. For instance, nano-coatings enhance performance without compromising sustainability.

Architectural and Automotive Applications

Sustainable acoustic textiles are increasingly used in green buildings, recording studios, theaters, and automotive interiors. They provide both sound insulation and eco-friendly design solutions, aligning with global green certification standards

Emerging Market and Regional Growth

The acoustic textiles market continues global expansion driven by new infrastructure projects, stricter noise regulations, and rising awareness of occupational health. North America and Europe lead in regulatory adoption, while Asia-Pacific exhibits rapid growth due to urbanization and technological adoption (Research and Markets, 2023).

Conclusion

Recent innovations in acoustic textiles illustrate their crucial role in addressing contemporary challenges of noise control, sustainability, and interior design flexibility. Through sustainable materials, smart integrations, modularity, and multifunctionality, acoustic textiles are becoming indispensable in creating healthy, comfortable, and attractive interior environments. Their alignment with global sustainability goals and regulatory trends further accelerates their

application across diverse sectors. Continued research and technological integration will strengthen their position as key solutions in modern architecture and environmental design.

NEW TRENDS AND APPLICATIONS OF TECHNICAL TEXTILES WITH FUTURE PROSPECTS

Dr. R. Anil Kumar, Dr. M. Prathiba
Assistant Professor, Department of Textiles and Apparel Design
R.S.Srinithi
UG Student, Department of Textiles and Apparel Design
Periyar University, Salem, Tamil Nadu, India

Abstract

Technical textiles are experiencing a period of unprecedented innovation, driven by advances in material science, sustainability demands, and digital transformation. The sector's shift towards bio-based polymers, recycled fibers, and closed-loop production is redefining environmental responsibility while enhancing fabric functionality. Smart textiles, featuring embedded sensors and responsive materials, enable applications in healthcare, sports, and agriculture by allowing real-time monitoring and adaptive performance., 3D knitting, and artificial intelligence-driven design streamline production, foster personalization, and minimize waste. The growing global technical textiles market reflects this momentum, underpinned by supply chain digitization and demand for antimicrobial, thermo regulating, and energy-harvesting fabrics. This article explores these recent innovations, highlighting key trends and their transformative impact across industries

Keywords: Smart textiles, Wearable technology, Digital printing,3D knitting, Artificial intelligence

1. Introduction

Technical textiles refer to textile materials and products manufactured primarily for their technical performance and functional properties rather than their aesthetic or decorative characteristics. Unlike conventional textiles, which are largely associated with apparel and home furnishings, technical textiles are designed to perform specific functions such as providing protection, enhancing durability, or facilitating medical treatment. According to industry reports, the global market for technical textiles has been expanding rapidly, with applications spanning defense, aerospace, medical, geotechnical, automotive, and sports sectors (Horrocks & Anand, 2016). This growth is attributed to rising consumer expectations for multifunctional materials, technological advances, and the pressing need for sustainable and high-performance solutions.

In recent years, the field has witnessed groundbreaking innovations in areas such as smart wearables, nanotechnology-based finishes, antimicrobial coatings, and eco-friendly fibers. These developments align with broader global trends toward digitalization, sustainability, and health consciousness. Technical textiles not only contribute to enhancing the quality of life but also play a significant role in addressing pressing global issues such as environmental degradation, healthcare challenges, and safety requirements. The integration of technologies such as IoT, sensors, and artificial intelligence into textiles has opened new dimensions, particularly in the domain of smart textiles, offering opportunities for monitoring, diagnosis, and even therapy. The following sections provide a comprehensive overview of recent applications and innovations in technical textiles, emphasizing their transformative potential across industries.

2. Sustainability and Green Materials

The most notable innovation is the mainstream adoption ofbio-based and recycled fibers. Fibers made from algae, mushrooms, agricultural waste, and recycled polyester are becoming standard in both luxury and mainstream textiles, amplifying ecological responsibility and reducing resource reliance (Heuritech, 2025; Macfil Global, 2025). Closed-loop recycling and advances in chemical separation technologies allow existing materials to be reclaimed and repurposed into high-performance textiles, supporting a sustainable, circular economy (Heuritech, 2025).

Fig:1Green building materials for a sustainable future

Source:https://www.planradar.com/ae-en/sustainable-building-materials-for-sustainable-future/

3. Responsive Textiles

Smart textiles now feature embedded sensors, actuators, and responsive polymers, enabling garments to collect and transmit real-time data (3-Tree, 2025; StartUs Insights, 2025). These developments have led to smart clothing that monitors heart rate, body temperature, and other biometrics for athletes and patients alike. In agriculture, UV-monitoring nets and moisture-responsive covers boost crop health, while in automotive applications, sensor-embedded fabrics enhance driver safety and comfort (3-Tree, 2025).

Fig:2Smart Textiles and Wearable Techn

Source:https://www.researchgate.net/figure/Functions-of-smart-textiles_fig1_347477888

4: 3D Knitting and Digital PrintingAdvanced Manufacturing

3D knitting uses computerized machines to create seamless, customizable garments directly from digital designs, reducing waste and cutting lead times (Polygiene, 2025; 3-Tree, 2025). Digital textile printing allows for on-demand production, vibrant color reproduction, and small-batch flexibility, aligning with the industry's growing emphasis on personalized and sustainable products (LinkedIn, 2025).

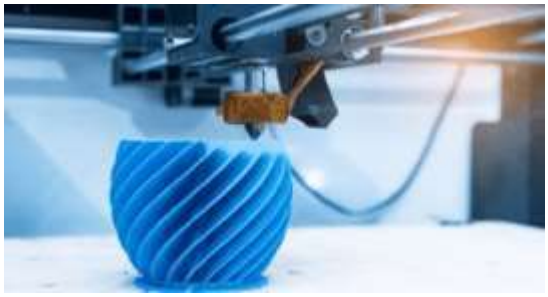

Fig:3In 3D printing, the object is additively manufactured layer by layer.
Source:https://www.3dnatives.com/en/3d-printing-knitwear-220720215/#!

5.Functional Finishes and High-Performance Coatings

Technical textiles are increasingly treated with finishes that provide antimicrobial, flame-retardant, UV-resistant, or water-repellent properties (StartUs Insights, 2025; Macfil Global, 2025). Nanotechnology-based finishes and coatings using silver or plant-based agents are critical in medical and sports textiles for enhanced hygiene and durability. Phase-change materials embedded in fabrics enable thermoregulation by absorbing, storing, and releasing heat, which is invaluable in performance wear and healthcare (StartUs Insights, 2025).

Fig:4 Flame retardant finishes
Source:https://indiantextilejournal.com/functional-finishes-enhancing-technical-textiles/

6.Artificial Intelligence and Digital Supply Chains

AI-integrated design and supply chain digitization accelerate time-to-market, reduce material waste, and support real-time traceability, ensuring both efficiency and ethical sourcing (StartUs Insights, 2025; LinkedIn, 2025). Predictive analytics aid in demand forecasting and inventory management, while smart factories leverage IoT and robotic automation to streamline production (LinkedIn, 2025).

Fig:5AI in Supply Chain: Revolutionizing Logistics and Operations
Source:https://nats.ca/Home/NewsArticle/ai-in-supply-chain/

7.1. Medical Textiles (Meditech)

Medical textiles have advanced significantly with the introduction of antimicrobial fabrics, wound-healing dressings, and implantable biomaterials. Recent innovations include drug-releasing bandages, biodegradable surgical meshes, and sensor-integrated fabrics for monitoring patient vitals (Zhang et al., 2021). Wound dressings and garments with embedded sensors, antimicrobial coatings, and bioactive agents for patient care and monitoring (3-Tree, 2025).Smart fabrics can now provide real-time data, reducing dependency on invasive monitoring systems.

Fig:6 medical textiles products

Source :https://apparelresources.com/business-news/manufacturing/tamil-nadu-growing-hub-medical-textiles-companies-announce-huge-investments/

7.2. Protective Textiles (Protech)

Protective textiles are critical in defense, industrial safety, and firefighting. Modern innovations focus on lightweight yet highly durable materials with fire retardancy, chemical resistance, and ballistic protection. Nanofiber coatings and graphene-infused fabrics are recent trends offering enhanced resistance to heat, impact, and hazardous chemicals (Das, 2022).

Fig:7Protective Textiles: A Remarkable Innovation in Technical Textiles

Source:https://textilearn.com/protective-textiles/

7.3. WearablesTextiles

Smart textiles represent one of the most transformative innovations, integrating electronics and sensors within fabrics. These textiles can monitor heart rate, body temperature, and hydration levels. Applications span from sports and fitness to military and healthcare. Wearable e-textiles embedded with flexible circuits and wireless communication modules are enabling a new generation of human–machine interaction (Stoppa&Chiolerio, 2014).

Fig:8 E-Textiles for Healthcare
Source:https://textilesinside.com/e-textile-smart-textile/e-textiles-for-healthcare/

7.4. Sustainable and Eco-Friendly Textiles

Sustainability has become a key driver of innovation in technical textiles. Biodegradable fibers, recycled polyester, and bio-based composites are being developed to minimize environmental impact. Agro-textiles that reduce water use and biodegradable geotextiles for soil stabilization are recent examples (Shen et al., 2020).

Fig:9 Eco-Friendly Fabrics
Source:https://fabric.textile-hy.com.tw/blog/post/sustainable-materials.html

7.5. Construction and Geotextiles

Geotextiles are increasingly used in civil engineering for soil stabilization, drainage, and erosion control. Recent innovations involve high-strength synthetic fibers and biodegradable alternatives that provide long-term functionality while aligning with sustainability goals (Koerner, 2012).

Fig:10 Importance of Geotextile in Road Construction
Source:https://oceangeosynthetics.com/importance-of-geotextile-in-road-construction/

7.6. Sports and Performance Textiles

Sports textiles now feature moisture management, UV protection, and muscle support. Smart performance fabrics can track biometrics and optimize athletic training. Additionally, lightweight, breathable, and stretchable fabrics are revolutionizing sportswear for professional athletes and enthusiasts alike (Wang et al., 2019).Thermo regulating, moisture-wicking, and sensor-embedded clothing for athletes and outdoor enthusiasts (Heuritech, 2025).

Fig: 11Sport textiles
Source :https://textilesinside.com/sport-textiles/introduction-to-sport-textiles/

7.7. Transportation and Automotive Textiles

In the automotive sector, technical textiles are being used for airbags, seat belts, interior linings, and noise-reducing composites. Recent innovations include lightweight composites that improve fuel efficiency and e-textiles for in-car comfort monitoring (Horrocks & Anand, 2016). Lightweight, durable, high-performance fabrics for efficient transportation and infrastructure projects (Macfil Global, 2025).

Fig:12Technical textiles
Source:https://acmemills.com/industry-news-blog/12-applications-of-technical-textiles-12-types-of-technical-textiles/

7.9.Agriculture

UV-resistant nets, moisture-responsive crop covers, and smart textiles for resource-efficient food production (Macfil Global, 2025)

Fig:13High-Performance Packaging Textiles
Source:https://macfilglobal.com/how-geotextiles-are-revolutionizing-infrastructure/

Conclusion

Recent innovations in technical textiles exemplify how the industry is rapidly reinventing itself to meet the evolving demands of society, the environment, and modern technology. The move towards green materials, such as bio-based and recycled fibers, along with smart functionalities powered by nanotechnology, biotechnology, IoT, and AI, has

redefined what is possible in textile engineering. Automated manufacturing and digital supply chains have enabled high-performance, customizable, and eco-friendly textile solutions, aligning industry practices with global sustainability goals while enhancing efficiency and product quality.

As technical textiles become increasingly vital in sectors ranging from healthcare and protective clothing to sports, transportation, and construction, their impact on industry standards and consumer experiences grows substantially. The dynamic field continues to be fueled by interdisciplinary research and advanced materials, bringing forth opportunities for innovation and addressing crucial social and environmental challenges. In the years ahead, technical textiles are poised to remain at the forefront of technological progress, delivering transformative solutions and catalyzing sustainable development worldwide.

A REVIEW ON EFFECTIVE INTELLIGENT DYEING USING PHOTOCHROMIC AND THERMOCHROMIC DYES

Ms. B. Aparna Devi
Research scholar, Department of Costume Design and Fashion,
Kongunadu Arts and Science College, Coimbatore
Dr. S. Divya
Assistant Professor & Head i/c, Department of Costume Design and Fashion,
Kongunadu Arts and Science College, Coimbatore

Abstract

Innovative opportunities for smart and flexible materials have been made possible by the incorporation of smart dyes into technological fabrics. The capacity of thermochromic and photochromic dyes to change to another colour in response to light and temperature stimuli is drawing interest in these types of dyes. This essay examines current developments in the application of those dyes for clever and efficient textile dyeing. While photochromic dyes provide UV-responsive coloration helpful in outdoor protection textiles and fashion applications, thermochromic solutions provide reversible colour transitions that may be used for safety gear, sports clothing, and medical monitoring materials. With a focus on environmentally acceptable binders, micro-encapsulation processes, and digital printing modifications that improve durability and speed, the study examines dye chemistry, applying techniques and compatibility alongside various fibres. Improvements in responsiveness, wash resistance, and multifunctionality, including incorporation with antimicrobial or UV-protective finishes, are highlighted in case examples. Issues such as a narrow colour spectrum, weariness from frequent use, and environmental stability are also covered. In order to produce next-generation intelligent textiles that combine aesthetics and functional performance, the study ends by outlining potential future avenues for merging chromic dyes with cutting-edge finishing technologies.

Keywords: Thermochromic dye, Photochromic dye, Intelligent textile, Smart dyeing,Functional fabrics.

Introduction

The textile business has recently moved away from conventional colouration methods and respecting creative strategies that combine style and utility. It is more attractive and more anticipated that technical fabrics in particular will produce intelligent reactions to environmental cues, creating new opportunities for applications in sports, protective gear, healthcare, and fashion. Thermochromic and photochromic dyes, that exhibit reversible colour changes in reaction to temperature and light, respectively, are among the most promising innovations. Those smart dye systems offer a special platform for producing textiles that offer practical advantages like temperature recording, protection from UV rays, and security signalling in addition to improving aesthetic appeal. The performance, wash resistance, and durability of chromic dyes have been further enhanced by developments in digital printing, eco-friendly binders, and microencapsulation, making them suitable for practical uses. However, issues including cost-effectiveness, environmental steadiness, and restricted colour scale still need to be resolved. This study examines new developments in thermochromic and photochromic dyeing techniques for textiles, emphasising their mechanics, methods of

application, multipurpose applications, disadvantages, and prospects for the next generation of smart textiles.

Methodology:

The research design for exploring thermochromic and photochromic dyes in smart dyeing involves selecting suitable textile substrates, preparing dye structures, and applying them through conventional dyeing, screen printing, or pad-dry-cure processes. Among the most efficient strategies is microencapsulation, which protects sensitive dyes and enhance their wash resistance. For example, Tamilmani et al. (2024) applied photochromic microcapsules on cotton fabrics with titanium oxide nanoparticles using a pad-dry-cure method, reaching multifunctional performance such as UV resistance, antimicrobial activity, and hydrophobicity. In a similar vein, Yu, Liu, Tan, and Wang (2024) produced double-stage temperature-responsive textiles with thermochromic leuco dye microcapsules, guaranteeing stable and reversible chromic behaviour. The efficiency of screen-printing photochromic dyes has demonstrated by Little and Christie (2010, 2011), who highlight the role of the application process, light exposure, and fibre type on performance results. More recently, spray-dried photochromic microcapsules applied to cotton textiles were examined by Morsümbül, Akçakoca Kumbasar, and Çay (2022), who showed that they ensured significant UV protection even after several washing cycles.

Spectrophotometric measurement ofcolour change (ΔE values), wash fastness, UV resistance, rubbing tests, and thermal cycling stability are typically included within the experimental analysis aimed at evaluating performance. To evaluate increases in durability and responsiveness, comparisons between traditional dyeing and cutting-edge methods like encapsulation, nanoparticle functionalisation, or plasma pre-treatments are frequently conducted. A holistic approach uncovers crucial process of parameters for industrial scalability and offers a framework for confirming the intelligent dyeing potential of thermochromic and photochromic systems.

Intelligent and Functional Application:

Fashion and utility may be combined by using thermochromic and photochromic dyes to create fabrics that react intelligently to environmental stressors. Thermochromic dyes can serve as temperature indicators in safety fabrics, changing colour as temperatures increase above defined standards. This property is especially useful in protective apparel for industrial workers, firemen, and children. These colours improve performance and user comfort in sports and leisure clothing by providing visual indications about body temperature or ambient circumstances. Another critical area is medical textiles, where thermochromic textiles are used to make fever-detecting clothing and color-changing wound dressings. Similar to this, photochromic dyes are widely used in protective and outdoor apparel to indicate exposure to UV rays, hence enhancing skin protection. In addition to their technical uses, both dye types are being utilised more and more in costume and fashion design to produce dynamic, interactive clothing that changes colour in response to various environmental factors, providing unique visual experiences. Additionally, their use in conductive, UV-protective, or antimicrobial treatments broadens their usefulness beyond basic colouring to include multipurpose smart textiles. These uses show the mechanism of chromic dyes may be used to create textile items that are intelligent, responsive to human input, and enhance performance.

Recent Innovations:

The performance and application of thermochromic and photochromic dyes in intelligent dyeing processes have been greatly enhanced by recent developments in textile colouration. Microencapsulation technology, which improves dye stability, wash fastness, and resistance to environmental elements including abrasion and light exposure, is among the most noteworthy advancements. Furthermore, it has been indicated that the use of nanoparticles like TiO_2, ZnO, and SiO_2 enhances UV stability and multifunctionality, offering antibacterial or UV-protective qualities in addition to colour-changing effects. The use of digital textile printing processes, which reduce chemical usage and water while enabling the accurate utilisationof chromic dyes in intricate patterns, is another significant advance. In addition, scientists are investigating hybrid chromic systems, which blend thermochromic and photochromic dyes to allow textiles to react to several stimuli at once, expanding their usefulness in technical and fashion textiles. Chromic dye technology is now in line with global eco- guidelines because to the growing popularity of eco-friendly binders and sustainable encasing materials. Collectively, these developments show a move towards more robust, multipurpose, and ecologically friendly methods, opening the door for smart textiles with intelligent dyeing processes to become economically feasible.

Challenges and Limitations:

The use of thermochromic and photochromic dyes in intelligent fabrics has improved considerably, however there are still a number of obstructions to wide- scale commercialisation. The limited colour palette is a big issue since photochromic dyes sometimes lack the depth and brightness necessary for fashion-oriented fabrics, while many thermochromic methods are confined to lighter or pastel tints. The long-term performance of chromic textiles is reduced due to durability challenges, including poor wash fastness, surface abrasion, and fatigue following numerous cycles ofcolour change. Another drawback is environmental stability photochromic dyes are susceptible to photodegradation under constant UV light, while thermochromic dyes are extremely vulnerable to extended heat exposure. Furthermore, these dyes are less competitive when compared to traditional colouration techniques due to the high cost of manufacture, especially for microencapsulation and nanoparticle integration. technological challenges arise from compatibility with various fibre types, particularly synthetic technological textiles, which frequently call for specific binders or surface treatments. Lastly, because the majority of published research are still at the laboratory or pilot size and only a small number show commercial viability, worries about scalability and sustainability remain. In order to fully utilise chromic dyes in clever and useful textile applications, these issues must be resolved.

Conclusion:

A promising move toward intelligent and responsive fabrics, thermochromic and photochromic dyes provide both practical advantages and creative design opportunities. Although recent advancements in digital printing, nanotechnology, and microencapsulation have increased their performance and durability, issues including scalability, cost, and restricted colour range still exist. These smart dyes are ideally suited for certain sectors like fashion, sports, healthcare, and safety where their interactive qualities are obviously useful. Chromium dyes have the potential to revolutionise dyeing techniques and play a big part in the development of smart textiles in the future, provided that further study is done on sustainability and industrial adaption.

TEXTILES IN EVERYDAY LIFE: IMPLICATIONS FOR FASHION DESIGN

Sayalimahasri. D.B
Department of Apparel and and Fashion Design , PSG College of Technology Coimbatore
Harshini. D
Department of Apparel and Fashion Design , PSG College of Technology Coimbatore

Abstract

Textiles have played a pivotal role in shaping human civilization, extending beyond their functional purpose of protection to encompass identity, culture, and innovation. This paper explores the integration of textiles in everyday life, with a particular focus on their implications for fashion design. Drawing on literature from sustainability studies, cultural theory, and design innovation, the paper examines how textiles mediate self-expression, sustainability, and technological advancement. It argues that fashion designers must respond to contemporary challenges—including ecological responsibility, cultural inclusivity, and digital transformation—by reimagining textiles as tools for ethical, aesthetic, and functional design.

Keywords: Textiles, Fashion Design, Everyday Life, Sustainability, Cultural Identity, Innovation

Introduction

Textiles are deeply embedded in the everyday experiences of individuals, serving as both functional necessities and symbolic carriers of cultural meaning. The evolution of textiles parallels human progress, from handcrafted fabrics to industrialized production and, more recently, to sustainable and digital innovations (Fletcher, 2014). Fashion design, as the most visible application of textiles, reflects how individuals and societies negotiate identity, status, and belonging (Kawamura, 2018). This paper investigates the role of textiles in everyday life and explores how fashion designers can engage with cultural, environmental, and technological dimensions of textiles.

The Cultural Significance of Textiles

Textiles embody cultural narratives through motifs, colours, and material choices. Traditional fabrics such as Indian khadi, Japanese kimono silk, and Ghanaian kente cloth demonstrate how clothing functions as an archive of heritage and collective identity (Eicher, 2010). Beyond tradition, textiles in fashion signal social status and subcultural affiliation, illustrating how fabric choices intersect with lifestyle and values (Entwistle, 2015).

Fashion designers engage with this cultural significance by reinterpreting traditional textiles in contemporary forms, balancing respect for heritage with modern aesthetic demands. For instance, sustainable brands have revived indigenous weaving techniques to create unique fashion statements while supporting artisanal economies (Julier, 2017).

Textiles and Self-Expression in Everyday Life

In everyday life, textiles are not merely functional but also integral to the expression of selfhood. Clothing choices communicate personal style, aspirations, and even emotional states (Barnard, 2014). Textiles contribute to these processes through tactile qualities, colours, and drape. Fashion designers must therefore recognize the psychological and symbolic functions of fabrics alongside their physical properties.

Sustainability and Ethical Dimensions

One of the most pressing challenges in fashion design is sustainability. The global textile industry is a significant contributor to pollution, water usage, and waste (Niinimäki &

Hassi, 2011). Designers increasingly turn to sustainable textiles—such as organic cotton, bamboo fibers, and recycled polyester—to reduce environmental impacts. Moreover, circular design principles, including upcycling and cradle-to-cradle systems, encourage new approaches to fabric usage (Fletcher & Tham, 2019).

Ethical considerations also extend to labour practices and supply chain transparency. Designers who source textiles from fair trade or artisanal networks contribute to more equitable global economies (Goworek, 2011). These practices highlight the moral responsibility of fashion professionals in shaping the industry's future.

Technological Innovations in Textiles

Technological advancements have expanded the possibilities of textiles beyond their traditional functions. Smart textiles integrate electronics into fabrics, enabling applications such as fitness monitoring, adaptive insulation, and interactive fashion (Mattila, 2006). Digital textile printing allows customization and rapid prototyping, reducing waste while enhancing creative expression (Tyler, 2013).

For fashion designers, these innovations open new horizons in both aesthetics and functionality. The fusion of fashion and technology suggests that everyday textiles may evolve into tools for communication, performance enhancement, and sustainable living.

Case Studies

Several fashion houses and brands illustrate how textiles in everyday life inspire design innovation:

1. **Stella McCartney:** Pioneers the use of sustainable materials like mushroom leather and recycled fabrics, merging luxury with ecological responsibility (Black, 2021).
2. **Nike:** Utilizes recycled polyester in performance wear, demonstrating how textiles can serve both environmental and athletic goals (Clark, 2020).
3. **Indian Khadi Revival:** Designers like Sabyasachi Mukherjee have revitalized khadi, positioning it as a modern luxury fabric while honouring its cultural roots (Mukherjee, 2019).

These examples underscore the multidimensional role of textiles in shaping the future of fashion.

Challenges and Future Directions

Despite progress, challenges persist in achieving sustainable and equitable textile use. Fast fashion's reliance on cheap synthetic textiles perpetuates overconsumption and waste (Joy et al., 2012). Moreover, access to advanced textile technologies remains uneven across regions, raising concerns about inclusivity in fashion innovation.

Future directions emphasize:

- **Circular economy models** for textiles
- **Integration of digital technologies** into fabrics
- **Cross-cultural collaborations** in textile design
- **Consumer education** to promote sustainable practices

Fashion designers will need to navigate these challenges by balancing innovation with responsibility.

Conclusion

Textiles in everyday life are far more than utilitarian objects; they embody cultural identity, personal expression, and opportunities for innovation. For fashion designers, textiles serve as both medium and message, demanding consideration of sustainability, ethics, and creativity. As fashion enters an era defined by ecological awareness and technological

advancement, reimagining textiles becomes essential to aligning design with the realities of contemporary life.

INNOVATIONS AND NEW APPLICATIONS OF MEDICAL TEXTILES IN HEALTHCARE

R.Sivasankari
UG Student, Department of Textiles and Apparel Design
Periyar University, Salem, Tamil Nadu, India
Dr. M. Prathiba, Dr. R. Anil Kumar
Assistant Professor, Department of Textiles and Apparel Design

Abstract

Technical textiles have revolutionized the medical field by offering versatile and innovative solutions that significantly improve patient care and medical practices. This article comprehensively explores current trends in medical textiles, highlighting the integration of smart textiles, sensor-enabled monitoring systems, antimicrobial and biodegradable materials, and eco-conscious manufacturing techniques. Modern medical textiles include smart wearable devices for continuous health surveillance, antimicrobial fabrics designed to combat infections, custom 3D-knitted prosthetics, and biodegradable wound dressings. These innovations not only enhance treatment efficacy and patient comfort but also address the critical need for sustainability in healthcare.The use of sensor-based smart textiles facilitates remote patient monitoring and telemedicine by enabling real-time data collection and transmission, which supports timely medical interventions. Advances in materials science have also paved the way for tissue engineering scaffolds and biodegradable dressings that promote healing while minimizing environmental impact. In addition, the industry is shifting towards environmentally responsible manufacturing processes and the adoption of green materials, responding to global sustainability goals.This paper also discusses regulatory and clinical challenges that limit the widespread adoption of these advanced textiles and outlines prospective research directions and practical strategies to overcome these barriers.

Keywords: Medical textiles, sensor-based monitoring systems, antimicrobial and biodegradable materials

1.Introduction

Technical textiles have increasingly become an integral component of modern healthcare, driving forward medical innovations that address complex clinical challenges and patient needs. The scope of medical textiles has broadened beyond conventional bandages and dressings, encompassing highly engineered fabrics and composites tailored for specific medical purposes. This evolution is fueled by advancements in textile sciences, incorporating interdisciplinary approaches from material engineering, nanotechnology, electronics, and biomedical research (Kubicek et al., 2022; Baptista-Silva, 2022). The demand for advanced medical textiles is propelled by several factors, including the rising prevalence of chronic and age-related illnesses, the necessity for infection control, the need for non-invasive or minimally invasive solutions, and the heightened importance of patient-centered care. These demands are further accentuated by global health crises, such as the COVID-19 pandemic, which catalyzed rapid adoption of telemedicine and remote monitoring technologies (Textiles Inside, 2023; Pristine Market Insights, 2024). Technical medical textiles encompass a spectrum of products, such as wound dressings, surgical gowns, suture materials, orthotic and prosthetic devices, implantable fabrics, and wearable electronics for health monitoring. Their functionalities extend to antimicrobial activity, controlled drug release, adaptive compression, tissue regeneration, and biosignal collection and transmission.Recent trends indicate a convergence towards sustainable and intelligent textile solutions. Smart textiles garments and bandages

embedded with electronic sensors—facilitate unobtrusive patient monitoring, real-time diagnostics, and data-driven personalized care (GreyB, 2025; Kubicek et al., 2022). Simultaneously, the adoption of biodegradable polymers and eco-friendly fibers addresses environmental burdens linked to disposable medical supplies. This article explores the contemporary landscape of medical textile innovation, providing a critical review of recent advancements, applications, and future prospects. Subsections will cover sensor-based smart textiles, antimicrobial and infection-resistant materials, biodegradable and sustainable solutions, customized implants, and textiles for remote care, furnishing both clinical relevance and technological context.

2. Applications of Textile: Recent Trends in Medical Field

2.1. Wound Care and Management

Medical textiles are essential in wound dressings, bandages, and compresses. Modern wound dressings are designed to provide moisture balance, oxygen permeability, and antimicrobial protection. Hydrogel-based dressings, nanofiber scaffolds, and bioactive textiles enhance wound healing and reduce infection risks (Boateng & Catanzano, 2015).

fig1:Mobile Wound Care Procedures and Best Practices
source:At-Home Wound Care Indicated Procedures Near Me | Mobile Wound Specialist

2.2. Surgical Applications and Implants

Textiles are widely used in surgical procedures, including sutures, hernia meshes, vascular grafts, and artificial ligaments. Biocompatible fibers like polylactic acid (PLA) and polyethylene terephthalate (PET) are used in implants due to their strength and compatibility with human tissues (Rajendran, 2014).

Fig2:Biomedical Textiles Capabilities
source:Biomedical Textiles - Confluent Medical

2.3. Infection Control and Hygiene

Hospital-acquired infections (HAIs) pose significant risks. Antimicrobial and antiviral fabrics are now used in hospital linens, drapes, and gowns. Recent trends include silver nanoparticles, chitosan, and herbal extracts incorporated into fabrics for antibacterial protection (Chellamani et al., 2013).

Fig3:Hygiene Product
source:Hygiene Product Archives - Wooba - Order Online 24/7 Malaysia

2.4. Personal Protective Equipment (PPE)

The COVID-19 pandemic emphasized the importance of protective textiles such as face masks, gowns, and gloves. Nonwoven textiles with multi-layered filtration systems provide effective barriers against pathogens while maintaining breathability (Das et al., 2021).

Fig4:PPE Clothing
source:PPE Clothing – Medisave UK

2.5. Smart Medical Textiles

Smart textiles integrate sensors and electronics for health monitoring. Examples include fabrics that track heart rate, respiration, glucose levels, and temperature. Such innovations improve patient monitoring in hospitals and allow remote healthcare (Stoppa &Chiolerio, 2014).

Fig5:Smart textile for healthcare
source:Applicationof Smart Textiles in Medical and Healthcare - Textile Blog

2.6. Sustainable Medical Textiles

Eco-friendly innovations focus on biodegradable fibers, reusable PPE, and recycling medical waste. Natural fibers like bamboo and organic cotton, combined with green finishing technologies, reduce the ecological impact of healthcare (Karthik &Rathinamoorthy, 2017).

2.7.Sensor-Based Smart Textiles

Smart medical textiles represent a major breakthrough by leveraging embedded sensors for biosignal monitoring, drug delivery, and adaptive response. These include garments that can monitor heart rate, respiration, body temperature, and glucose levels in real-time, interfacing with telemedicine platforms to inform clinicians remotely (GreyB, 2025; Kubicek et al., 2022). One major application is wound caresmart bandages embedded with chemical or pressure sensors can deliver medication on-demand or send healing progress data to caregivers.

2.8.Antimicrobial and Infection-Resistant Textiles

Infection prevention is paramount within clinical settings, prompting extensive research into antimicrobial textiles. Innovations involve embedding fabrics with agents such as silver nanoparticles or applying antimicrobial coatings to prevent growth of bacteria, fungi, and viruses. Application areas include hospital linens, patient gowns, surgical drapes, and dressings. Advanced fabrics are now also capable of self-cleaning and liquid-repellent properties to further minimize cross-contamination (Textiles Inside, 2023; Bitsathy, 2024).

2.9.Biodegradable Wound Dressings and Tissue Engineering

Sustainable, biodegradable textiles are addressing both patient wellness and environmental safety. Biodegradable wound dressings made from polymers such as chitosan and alginate facilitate healing while naturally decomposing, reducing waste and avoiding multiple dressing changes for chronic wounds (Bitsathy, 2024). In tissue engineering, textile scaffolds provide structural support for cell proliferation and regenerative therapies in the repair of burns, ulcers, and soft tissue injuries (Baptista-Silva, 2022).

2.10.Custom 3D-Knitted Implants and Prosthetics

Advances in 3D-knitting and textile manufacturing enable the creation of custom-designed implants and prosthetics tailored to individual patient anatomy. These textile-based structures, made from biocompatible materials, offer improved fit, comfort, and integration

with biological tissues. 3D textiles are also being explored for use in cartilage and ligament repairs, stents, and artificial blood vessels (Textiles Inside, 2023).

2.11.Eco-Friendly and Sustainable Medical Textiles

Environmental concerns have driven the sector towards sustainable fibers, recyclable materials, and green production processes. Hospitals now increasingly rely on reusable linens, biodegradable disposables, and materials manufactured with reduced water and chemical footprints. Such practices not only minimize medical waste but also bolster institutional sustainability goals (Textiles Inside, 2023).

2.12.Remote Monitoring and Telemedicine Solutions

The aftermath of the global pandemic accelerated the role of remote monitoring in disease management. Textile-integrated health trackers now transmit continuous physiological datasuch as ECG, temperature, or oxygen saturation to healthcare providers, enabling chronic disease management and early intervention (Textiles Inside, 2023; GreyB, 2025). These garments are designed for comfort, usability, and data accuracy, fundamentally reshaping outpatient and home-care paradigms

Conclusion

Medical textiles have progressed from simple bandages to highly specialized, multifunctional materials that are redefining healthcare. Their evolution reflects the industry's response to growing demands for safety, comfort, sustainability, and technological innovation. Recent advancessuch as sensor-integrated fabrics, antimicrobial finishes, and biodegradable dressingsdemonstrate how textiles are increasingly aligned with patient-centered care and eco-friendly practices. These innovations not only enhance treatment outcomes but also contribute to infection control, personalized medicine, and resource efficiency.Looking ahead, medical textiles will play an even greater role in shaping the future of healthcare. Integration with digital health systems, adoption of circular economy models, and advancements in nanotechnology will further expand their applications. By bridging functionality, sustainability, and technology, medical textiles are set to remain at the forefront of healthcare innovation, ensuring better quality of life and more efficient medical solutions for societies worldwide.

FUTURE-READY GREEN ENTERPRISES AND SOCIAL INNOVATION IN THE TEXTILE SECTOR

M. Nandhini
Assistant Professor, Department of Costume Design and Fashion,
Nehru Arts and Science College, Coimbatore
S. Arshana Parwin
Student, Department of Costume Design and Fashion,
Nehru Arts andScience College, Coimbatore

Abstract

The textile sector is experiencing a transformative shift toward sustainability and social innovation. Beyond technological advancement, enterprises are increasingly rethinking their business models to align with environmental stewardship and inclusive growth. This paper synthesizes recent literature and practice to propose a framework for future-ready green enterprises that integrate ecological responsibility with social value creation. We analyze how digital technologies enable circular and resource-efficient processes and how enterprise-driven social innovations foster fair labour, skills development, and community resilience. Using a conceptual synthesis of academic and industry sources combined with illustrative case examples, we propose a typology of sustainable business models and map mechanisms of social impact. The study highlights that intentional enterprise design and governance are essential for ensuring that sustainability transitions deliver not only ecological but also social benefits.

Keywords: Green Enterprises, Sustainable Textiles, Circular Economy, Social Innovation, Future-Readiness, Inclusive Value Creation

1. Introduction

The global textile and apparel sector contributes substantially to economic growth, employment, and trade but is also among the most resource-intensive industries. Characterized by high water and energy consumption, chemical-intensive processes, and complex supply chains, the sector faces mounting criticism for its environmental footprint and labour challenges. Growing consumer demand for sustainable products, evolving regulatory frameworks, and global climate commitments are accelerating the need for structural transformation.

Future-ready green enterprises are those that embed circular economy principles, adopt digital tools for efficiency and traceability, and embrace social innovation to deliver inclusive value. These enterprises represent a shift from conventional growth models toward approaches that prioritize resource regeneration, fair livelihoods, and long-term community resilience. This paper develops an integrated framework to understand how green business models intersect with social innovation in shaping the future of textiles.

2. Literature Review

2.1 Circular economy and sustainable enterprises in textiles

Circular economy strategies including design for durability, reuse, recycling, and product-as-service models are increasingly visible in textiles. Digital enablers such as product passports and reverse logistics platforms support these shifts, allowing enterprises to close material loops and extend product lifecycles.

2.2 Digital technologies and green transformation

Emerging technologies enable process optimization, predictive maintenance, and transparent supply chains. IoT, AI, and blockchain are helping enterprises reduce resource use, improve

traceability, and enhance efficiency. However, successful adoption depends on data standards, governance, and workforce readiness.

2.3 Social innovation and inclusive growth

Social innovation reframes enterprise strategy to address human and community needs alongside economic goals. In textiles, this includes artisan collaboration, human–machine cooperation, gender equity programs, and resilient local supply chains. Enterprises that integrate social missions within their models are shown to create lasting social value.

2.4 Social implications of sustainability transitions

Green transitions are not socially neutral. While circular economy adoption creates jobs in recycling, repair, and local production, risks remain if labour protections are weak. Socially driven enterprises and inclusive policies are crucial for ensuring that ecological benefits are paired with equitable outcomes.

3. Methodology

This study adopts a qualitative, exploratory methodology to examine the intersection of future-ready green enterprises and social innovation in the textile sector. The research is primarily based on a systematic review of secondary data drawn from peer-reviewed journals, industry reports, policy documents, and global sustainability frameworks such as the UN Sustainable Development Goals and the European Commission's Industry 5.0 roadmap.

Sources were identified through databases including Scopus, Web of Science, and Google Scholar, with emphasis on literature published between 2010 and 2025 to capture both foundational theories and emerging trends. Thematic analysis was employed to identify recurring patterns related to technological enablers, green business models, and social innovation mechanisms. In addition, case illustrations from global textile hubs were integrated to contextualize theoretical insights and highlight practical applications.

While the study provides a conceptual framework, its reliance on secondary data limits the scope for empirical validation, suggesting that future research should employ field-based surveys, interviews, and participatory methods with stakeholders to strengthen evidence and applicability.

This paper employs a conceptual and practice-oriented approach by:

- Reviewing peer-reviewed literature and industry reports,
- Drawing illustrative cases of sustainable and social enterprises in textiles, and
- Developing a framework that links technologies, green business models, and social impact mechanisms.

4. Proposed Framework: From Technology to Green Enterprises to Social Innovation

The proposed framework positions technology as the enabler of future-ready green enterprises, which in turn generate social innovation and inclusive value creation. Industry 4.0 and 5.0 technologies—such as IoT-based monitoring systems, AI-driven process optimization, blockchain-enabled product passports, and collaborative robotics—provide the digital backbone for sustainable transformation in textiles.

These technologies support enterprise-level green business models including product-as-service systems that extend garment lifecycles, digital-enabled reverse logistics that enhance recycling efficiency, regenerative and ethical sourcing strategies that strengthen farmer and artisan linkages, and resource-efficient smart manufacturing through localized micro-factories and demand-driven production. However, ecological outcomes alone are insufficient; intentional enterprise design must embed social innovation mechanisms to ensure equitable benefits.

This includes securing fair and decent livelihoods through wage protections and profit-sharing, enabling skills development and employability through digital upskilling and craft–design collaborations, advancing gender equity and inclusion through cooperative ownership models, and fostering community resilience by anchoring production in local economies. The framework emphasizes that technology adoption, when aligned with green business models and social design principles, can reconfigure the textile industry into a system that is simultaneously sustainable, equitable, and resilient.

1. **Enterprise Models for Sustainability**
    - **Product-as-Service (PaaS):** subscription or leasing models that extend lifecycles and incentivize take-back.
    - **Digital-Enabled Reverse Logistics:** AI-driven sorting, chemical recycling informed by material identifiers.
    - **Regenerative and Ethical Sourcing:** partnerships with smallholders, handloom communities, and fair-trade suppliers.
    - **Resource-Efficient Smart Manufacturing:** localized micro-factories, demand-driven production, near-zero waste systems.
2. **Social Innovation Mechanisms**
    - **Fair and Decent Work:** guaranteed wages, profit-sharing, and safe working conditions.
    - **Skills and Employability:** digital upskilling, artisan–designer collaborations, vocational programs.
    - **Gender Equity and Inclusion:** cooperative ownership, targeted training, and empowerment initiatives.
    - **Community Resilience:** strengthening local economies through decentralized production.

The framework emphasizes that green enterprises must deliberately integrate social design principles rather than assuming technology alone guarantees positive outcomes.

5. Illustrative Cases

- **Regenerative Cotton Revival (Gujarat, India):** revival of kala cotton through market linkages, raising artisan incomes and ecological resilience.
- **Digital Traceability for Circularity:** blockchain pilots enabling product passports and recycled content verification, building consumer trust.
- **Social Enterprises in Textiles:** mills and brands combining fair wages, cooperative ownership, and community reinvestment.

6. Opportunities and Barriers

The integration of future-ready green enterprises and social innovation in the textile sector presents significant opportunities while also posing critical barriers. On the opportunity side, advanced digital tools such as IoT, AI, and blockchain enable enterprises to optimize resource use, reduce environmental footprints, and achieve greater transparency across supply chains. Circular models—such as product-as-service, take-back programs, and regenerative sourcing become more scalable with digital support, while Industry 5.0's human-centric focus revitalizes artisanal crafts, enhances worker skills, and strengthens local community resilience. These innovations not only improve sustainability performance but also generate market differentiation, brand value, and consumer trust. However, barriers remain that threaten widespread adoption. High capital costs and limited access to technology restrict small and medium enterprises, particularly in developing economies. Workforce skill gaps risk excluding low-skilled labourers and artisans, while fragmented standards and interoperability issues undermine collaboration in circular systems.

Social risks also emerge if circular models push work into informal or unsafe recycling sectors, and policy gaps in many regions fail to enforce or incentivize eco-social practices. Therefore,

while future-ready green enterprises hold transformative potential, realizing their promise requires deliberate investments in technology access, skills training, regulatory frameworks, and social safeguards.

Opportunities:

1. Improved resource efficiency through digital tools.
2. Closed-loop, circular value chains.
3. Human-centric innovation and craft integration.
4. Enhanced social value creation through fair wages and equity.
5. Market differentiation via ethical and green branding.

Barriers:

1. High technology adoption costs for SMEs.
2. Workforce skill gaps and risk of exclusion.
3. Fragmented standards and data interoperability issues.
4. Risks of informalization in recycling sectors.
5. Weak regulatory enforcement in many regions.

7. Policy and Managerial Recommendations

- Incentivize green and social business models through subsidies and tax credits.
- Mandate product passports and transparency in sourcing.
- Support local micro-factories to reduce environmental footprints.
- Invest in skills training and ensure social safeguards.
- Build standardized, interoperable data frameworks for the sector.

8. Research Agenda and Limitations

The field of future-ready green enterprises and social innovation in the textile sector remains emergent, offering a wide scope for further exploration. Future research should focus on longitudinal studies that assess the environmental and social impacts of enterprise-led circular models over time, including reductions in water, energy, and waste alongside improvements in worker welfare and community resilience.

Comparative analyses across regions and production systems are also needed to understand how cultural, regulatory, and economic contexts influence the success of eco-social innovations, thereby informing adaptable models for diverse textile hubs. Integrating Life Cycle Assessment with Social Life Cycle Assessment will be essential to capture the dual ecological and social dimensions of sustainable enterprises.

However, this paper has certain limitations, as it is primarily conceptual, relying on secondary data from literature and industry reports rather than original empirical findings. While the proposed framework is grounded in documented trends and case illustrations, its practical applicability requires validation through field-based studies, stakeholder engagement, and pilot projects to test its scalability and long-term impact.

Research Priorities:

- Longitudinal impact studies tracking ecological and social outcomes.
- Cross-country comparative analyses of eco-social textile enterprises.
- Lifecycle and social lifecycle assessments of circular business models.

Conclusion

In conclusion, future-ready green enterprises represent a pivotal pathway for reimagining the textile sector as both environmentally sustainable and socially inclusive. By aligning digital technologies with circular business models, enterprises can reduce resource dependency, enhance transparency, and promote regenerative production systems. Yet, the true transformation lies in embedding social innovation ensuring fair work, equitable participation,

and resilient local economies within these models. The framework presented in this study underscores that technological adoption alone does not guarantee positive outcomes; intentional governance, enterprise design, and policy support are essential to balance ecological goals with social justice. As global sustainability pressures intensify, enterprises that successfully integrate green innovation with social value creation will not only strengthen industry competitiveness but also contribute to a just and resilient textile future.

Abstract
Acoustic textiles play a crucial role in addressing the growing need for sound management and noise reduction in modern environments. Engineered to absorb, diffuse, or block sound waves, these fabrics enhance acoustic comfort while mitigating the adverse effects of noise pollution. Their applications span across architecture, transportation, healthcare, workplaces, entertainment venues, and public spaces, where improved sound quality directly contributes to functionality and well-being. Recent advancements in sustainable materials and smart textile technologies further expand their potential, enabling energy efficiency, environmental protection, and enhanced user experience. This paper examines the evolving significance of acoustic textiles, emphasizing their technological, environmental, and social impact.
Keywords
Acoustic textiles, noise reduction, sound absorption, smart textiles, sustainability

1.Introduction

The modern era has witnessed an unprecedented pace of urbanization, industrialization, and technological advancement, all of which have significantly transformed human lifestyles and environments. While these developments have improved convenience and connectivity, they have also resulted in a rise in environmental concerns, among which noise pollution is one of the most pressing. Unwanted noisewhether from traffic, machinery, crowded public spaces, or electronic deviceshas become an unavoidable aspect of modern living.

Research has consistently shown that prolonged exposure to noise pollution is not just an irritant but a serious health hazard. It has been associated with increased stress levels, disturbed sleep patterns, reduced concentration, cardiovascular problems, and decreased overall productivity. In workspaces, educational institutions, healthcare facilities, and residential areas, the need for effective sound management has therefore become essential to ensure both comfort and well-being.

Acoustic textiles have emerged as a promising solution to this challenge. These are specially engineered fabrics designed to absorb, diffuse, or block sound waves, thereby reducing noise levels and enhancing acoustic comfort. Unlike traditional soundproofing materials that often compromise on aesthetics, acoustic textiles offer both functional and visual appeal. They can be seamlessly integrated into interiors through curtains, wall panels, upholstery, and partitions, combining design flexibility with technological performance. By addressing the dual need for noise control and aesthetic enhancement, acoustic textiles represent a sustainable, human-centered innovation in modern architecture and design.

2. Role of Acoustic Textiles

2.1 Architecture and Interior Design

In the field of architecture and interior design, the demand for acoustic comfort has grown significantly with the rise of open-plan offices, co-working spaces, and multipurpose

halls. Acoustic textiles such as wall panels, curtains, upholstery, and ceiling fabrics are engineered to absorb mid-to-high frequency sounds, thereby reducing reverberation and echo. This ensures that speech and music within a space remain clear and intelligible.

For example, in large auditoriums or theaters, acoustic curtains are not just decorative elements but functional barriers that balance sound reflection and absorption. Similarly, in modern corporate offices, textile-based partitions and ceiling baffles are used to control noise levels and improve speech privacy without compromising on aesthetics. Unlike heavy structural soundproofing materials, acoustic textiles are lightweight, flexible, and can be easily integrated into interior décor, offering both functionality and visual appeal.

2.2 Transportation

Noise, vibration, and harshness (NVH) remain major challenges in the transportation sector. Passengers in cars, trains, and airplanes are frequently exposed to a mix of engine noise, aerodynamic sounds, and vibrations from mechanical components. Acoustic textiles have emerged as a key solution in enhancing passenger comfort by being integrated into seat covers, carpets, headliners, floor mats, and side panels.

These fabrics act as sound absorbers and dampers, reducing the transfer of external and structural noise into the cabin. For luxury and electric vehicles, where quietness is a mark of sophistication, advanced acoustic fabrics are indispensable. Similarly, in aviation, lightweight yet high-performing acoustic textiles are crucial because they reduce noise without adding significant weight to the aircraft, thereby supporting both passenger comfort and fuel efficiency.

2.3 Healthcare and Education

Healthcare facilities and educational institutions are environments where excessive noise can have particularly detrimental effects. In hospitals, continuous noise from medical equipment, staff movement, and alarms can disturb patients' rest and recovery. Acoustic textiles, in the form of sound-absorbing curtains, wall linings, and partitions, are increasingly used to reduce background noise, creating calm and healing spaces.

In educational settings such as classrooms, lecture halls, and libraries, poor acoustics can hinder effective communication between teachers and students. Textiles designed for acoustic absorption ensure that speech is clearer, reduce the strain of listening, and improve overall learning outcomes. In both cases, these textiles contribute not just to acoustic comfort but also to psychological well-being and functional efficiency.

2.4 Industrial Applications

Industrial spaces such as factories, workshops, and warehouses are often associated with high levels of machinery noise. Prolonged exposure to such environments can lead to hearing impairment, reduced worker concentration, and compliance issues with occupational safety standards. Acoustic textiles provide a practical solution by being used in sound barriers, machine covers, ceiling hangings, and wall panels.

These materials reduce the propagation of sound waves within industrial settings, helping to keep noise levels within permissible limits. Additionally, in open-plan offices, textile-based acoustic panels and work pods help reduce conversational noise, thereby enhancing productivity and supporting workplace well-being. Their lightweight, modular, and flexible nature makes them an attractive alternative to heavy acoustic structures.

2.5 Entertainment and Media

The entertainment and media industry places the highest emphasis on acoustic precision. In recording studios, broadcast stations, theaters, and cinemas, even minor distortions or echoes can negatively impact the quality of sound. Acoustic textiles are widely used here as backdrops, stage curtains, wall coverings, and ceiling panels to absorb sound waves and prevent unwanted reverberation.

In cinemas and theaters, these textiles enhance the audience's listening experience by ensuring clarity of dialogues and music, while in recording studios, they provide a controlled acoustic environment that allows sound engineers to capture high-quality recordings. Importantly, these textiles serve a dual purpose: they maintain sound integrity while also acting as aesthetic and decorative elements, blending functionality with artistic presentation.

2.6 Sustainability and Smart Textiles

One of the most exciting developments in acoustic textiles is their alignment with the global shift toward sustainability and smart innovations. Traditionally, acoustic materials were made from synthetic fibers such as polyurethane foams or mineral wool, which raised environmental concerns. Today, eco-friendly options such as jute, wool, hemp, cotton blends, and recycled polyester are being increasingly used to create acoustic fabrics that are both effective and environmentally responsible.

Furthermore, advances in textile technology have given rise to smart acoustic textiles. These fabrics are embedded with sensors or adaptive materials that can monitor noise levels in real-time and adjust their properties accordingly. For example, smart curtains in smart homes may automatically adapt to absorb more sound during high-noise hours, while office installations may integrate with IoT systems to optimize workplace acoustics. This combination of sustainability and intelligence makes acoustic textiles a future-ready solution for modern living.

3.Advantages of Acoustic Textiles

Noise Reduction

The primary advantage of acoustic textiles is their ability to reduce unwanted background noise. Unlike traditional hard surfaces that reflect sound, acoustic fabrics absorb sound waves, thereby minimizing echoes and reverberation. This ensures that speech remains clear and intelligible, making them especially valuable in offices, classrooms, and auditoriums where communication is critical. In residential environments, they contribute to a quieter atmosphere, reducing disturbances from neighbors, traffic, or outdoor activities.

Health Benefits

Noise pollution is recognized as a significant contributor to stress, anxiety, sleep disturbances, and even long-term health risks such as hypertension and hearing loss. Acoustic textiles provide an effective way to mitigate these risks by lowering sound intensity in the environment. Hospitals and healthcare centers use them to promote rest and healing, while in workplaces, they reduce fatigue and boost concentration levels. In homes, acoustic curtains and panels can improve sleep quality by limiting nighttime noise, thus supporting both mental and physical well-being.

Aesthetic Appeal

Beyond their technical performance, acoustic textiles offer strong visual appeal. Available in a wide range of colors, textures, and designs, they can be integrated seamlessly into interior spaces without compromising on style. Architects and designers increasingly prefer textile-based acoustic solutions because they combine form with function. For instance, decorative wall panels or patterned curtains can enhance room aesthetics while serving as effective sound absorbers. This dual role makes them a preferred choice in modern architecture and interior design.

Lightweight and Flexible

One of the most practical benefits of acoustic textiles is their lightweight and flexible nature. Unlike rigid soundproofing materials such as gypsum boards or concrete barriers, acoustic fabrics can be easily installed, replaced, or repositioned. This makes them especially useful in settings that require mobility or frequent reconfiguration, such as exhibition halls,

conference centers, or multipurpose rooms. Their flexibility also allows for creative applications, including modular panels, foldable partitions, or suspended ceiling baffles.

Sustainability

As sustainability becomes a central concern in material design, acoustic textiles are increasingly being produced from renewable and recycled sources. Natural fibers such as wool, jute, and hemp not only offer excellent acoustic performance but are also biodegradable. Similarly, recycled polyester derived from plastic bottles is now being used to manufacture acoustic panels and curtains, providing a second life to waste materials. By embracing eco-friendly options, acoustic textiles contribute to reducing environmental impact while meeting the growing demand for green building materials.

Adaptability

Perhaps one of the most remarkable features of acoustic textiles is their adaptability across diverse environments. From homes and offices to hospitals, transportation, cinemas, and public spaces such as airports or shopping malls, they can be tailored to meet specific acoustic needs. In residential settings, they enhance comfort and privacy; in transportation, they improve passenger experience; and in industrial settings, they ensure compliance with occupational safety regulations. This versatility makes acoustic textiles a universal solution to noise management challenges in the modern era.

Conclusion

Acoustic textiles have evolved from being niche design elements to becoming indispensable solutions for managing sound in modern environments. Their unique ability to absorb, diffuse, and regulate sound waves allows them to address the challenges of noise pollution across multiple sectorsranging from architecture and transportation to healthcare, industry, entertainment, and public spaces. Unlike traditional soundproofing materials, they offer the advantage of being lightweight, flexible, and aesthetically adaptable, thereby enhancing both functionality and design.

Moreover, the health and well-being benefits of noise reduction, combined with the rising global emphasis on sustainability, make acoustic textiles a critical innovation in contemporary material science. The integration of renewable fibers such as wool, jute, and hemp, along with recycled polyester, demonstrates how these fabrics can align with environmental goals. At the same time, advancements in smart textiles—with embedded sensors and adaptive capabilities—point to a future where acoustic solutions are not only efficient but also intelligent and responsive.

In conclusion, acoustic textiles represent a powerful synergy of technology, sustainability, and human-centered design. As societies continue to grapple with urbanization and industrialization, their role in shaping healthier, quieter, and more sustainable environments will only expand. This makes them not just functional materials, but essential contributors to improving quality of life in the modern era.

A STUDY ON DEVELOPMENT OF BIODEGRADABLE BUTTONS WITH AMARANTHUS DUBIUS SEEDS USING GUM ROSIN AND SAWDUST

Ms.L.Devimuthumari
Assistant Professor of Costume Design and Fashion,
V.V.Vanniaperumal College for Women, Virudhunagar.
Ms. S.Nandhini
III B.Sc Costume Design and Fashion,
V.V.Vanniaperumal College for Women, Virudhunagar

Abstract

The fashion industry is one of the largest contributors to environmental pollution, with a significant amount of textile accessories and trims being discarded as non-biodegradable waste.In response to this challenge, the concept of seed infused buttons has been developed as a sustainable and innovative approach to reduce waste and encourage environmental restoration. These buttons are produced using natural, biodegradable materials such as sawdust and tree guminto which selected plant seeds are embedded. Unlike conventional plastic or metal buttons, seed infused buttons have a dual purpose—first serving as a functional fastening accessory for garments, and later, after their use, transforming into a medium for plant growth.When disposed of or intentionally planted in soil, the button naturally decomposes, releasing the seeds which then germinate under suitable conditions. This process not only reduces landfill accumulation but also promotes urban greening and ecological balance. Careful consideration is given to the choice of seeds, focusing on fast-germinating and low-maintenance species such as Amaranthus dubius (spleen amaranth) that offer both ecological and nutritional benefits. The project also explores design aesthetics, durability, and manufacturing techniques to ensure that the buttons maintain their strength, texture, and visual appeal while remaining completely biodegradable.The research highlights the potential of seed infused buttons in promoting circular fashion, where waste is reintegrated into natural cycles instead of being discarded. By merging functionality, sustainability, and design innovation, this project positions seed infused buttons as a practical solution for eco-conscious consumers and designers. It demonstrates how a small accessory can inspire a larger movement towards sustainable fashion practices, encourage afforestation, and create a greener future.

Keywords: Biodegradable, Sustainable, Zero-waste fashion, Second life and Eco friendly.

Introduction

The fashion industry is increasingly embracing sustainability, and while brands think of fabrics in sustainable materials, they often forget that accessories like buttons are no exception. Sustainable buttons offer an eco-friendly alternative to conventional fasteners, aligning with the growing demand for responsible fashion. These buttons are crafted from biodegradable materials like sawdust and gum rosin. The environmental impact of traditional buttons, often made from plastic or metal, is significant. By choosing sustainable alternatives like tree gum, saw dust etc, fashion brands can reduce waste, lower their carbon footprint, and promote ethical sourcing practices. Seed-infused buttons offer a unique intersection of fashion and environmental consciousness. These buttons are not just functional fasteners but also biodegradable elements embedded with live seeds, designed to sprout new life after their use. Once the garment reaches the end of its life cycle, the buttons can be removed, planted in soil, and nurtured to grow into herbs promoting circularity and eco-awareness. By integrating seeds into the structure of natural materials such as compressed sawdust and tree gums these buttons serve as a symbolic and practical step toward zero-waste fashion.The idea behind seed infused buttons is not merely to provide an alternative to plastic but to bring about a positive lifestyle

change where fashion becomes a medium for environmental awareness. The project aims to showcase the potential of seed infused buttons as a practical, affordable, and eco-friendly solution for the fashion industry. By incorporating such ideas into garment design, fashion can evolve into a more conscious and purposeful industry that not only meets consumer needs but also supports environmental well-being.

To the best of our knowledge, this is the first study to investigate Development of biodegradable buttons with Amaranthus Dubius seeds using Gum rosin and sawdust.

OBJECTIVES

1. To develop biodegradable buttons using Amaranthus dubius seeds, gum rosin, and sawdust as raw materials.
2. To explore eco-friendly alternatives to plastic buttons for sustainable fashion applications.
3. To evaluate the physical and functional properties of the produced biodegradable buttons.
4. To promote the use of natural and agricultural by-products in innovative product design.
5. To contribute towards reducing plastic waste and encouraging sustainable fashion practices.

1. Materials Needed

- Gum Rosin (insoluable in water, acts as natural binder)
- Fine sawdust
- Amaranthus dubius seeds (Arai keerai)
- Water (minimal, for mixing)
- Button moulds (silicone)

Gum Rosin **Fine sawdust** **Amaranthus dubius seeds**

2. Prepare the Binding Mixture

- In a mixing bowl, dissolve tree gum until it forms a thick, sticky paste.
- Ratio: 2 parts sawdust : 1 part tree gum paste (adjust for firmness). Add Sawdust
- Gradually mix fine sawdust into the gum paste.
- Ensure an even, dough-like consistency, firm enough to hold shape but not too dry.

3. Mix in Seeds

- Once the sawdust-gum mixture is ready, gently fold in seeds.
- Mix slowly to avoid crushing seeds.
- Keep moisture levels low to prevent premature sprouting.

4. Shape the Buttons

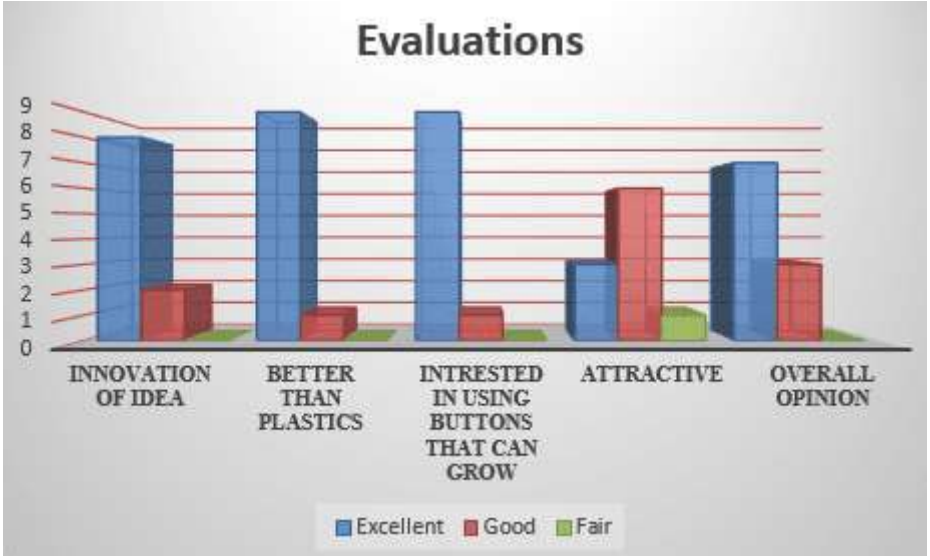
- Mould Method: Press the mixture into button moulds.
- Thickness: Around 3–4 mm for durability.

5. Drying Process

- Place shaped buttons in a shaded, well-ventilated area.
- Avoid direct sunlight or heat, which can damage seed viability.
- Dry for 1 hour until hard.

6. Finishing

- Smooth rough edges with fine sandpaper if needed.



RESULTS AND DISCUSSION

The study of this project was about 'Development of Biodegradable Buttons with Amaranthus Dubius seeds using Gum Rosin and Sawdust' and was asked to give their opinion about the seed buttons. The survey was conducted among ten members and the collected, consolidated and tabulated.

Opinion	Excellent	Good	Fair
Innovation of idea	8	2	-
Better than plastics	9	1	-
Interested in using buttons that can grow	9	1	-
Attractive	3	6	1
Overall opinion	7	3	-

To get suggestions about seed buttons from 10 respondents. The results of the respondents were discussed in the following figure.

From the above Table the result evaluates that 8respondents are highly encouraging the innovation of idea, 9 members think it's better than plastics, 9 members are interested in using

the buttons, 3 people think its attractive. The overall opinion of the 7 respondents are highly encouraging the product design.

CONCLUSION

In this study successfully demonstrates an eco-friendly alternative to plastic buttons in the fashion industry. By utilizing Amaranthus dubius seeds as a core element, gum rosin as a natural binder, and sawdust as a reinforcing agent, the buttons produced are not only durable and functional but also biodegradable. This innovation highlights the potential of agricultural by-products and natural materials in creating sustainable fashion accessories.The study proves that biodegradable buttons can reduce dependence on synthetic, non-degradable plastics, thereby minimizing environmental pollution. Furthermore, the project encourages industries and consumers to adopt eco-conscious practices, promoting a shift towards sustainable fashion. With further refinement and large-scale production, these biodegradable buttons can serve as a practical, affordable, and environmentally friendly alternative, contributing significantly to waste reduction and sustainable development.

REVITALIZATION OF KANCHIPURAM SILK SAREES: TRADITION, CHALLENGES AND FUTURE PROSPECTS

Dr. S. Jayapriya
Associate Professor and Head, Department of Costume Design and Fashion
Nehru Arts and Science College, Coimbatore- 641 105.
F.AfraFathima
III B. Sc. CDF, Department of Costume Design and Fashion
Nehru Arts and Science College, Coimbatore- 641 105.

Abstract

The Kanchipuram saree, often referred to as the "Queen of Silks," holds an unparalleled place in the cultural heritage of Tamil Nadu. Known for its rich silk, lustrous zari, and exquisite craftsmanship, the Kanchipuram saree has long been associated with rituals, festivals, and weddings. However, globalization, changing fashion preferences, imitation fabrics, and declining interest among younger generations have threatened its survival. This paper explores the revival strategies adopted for sustaining the craft, highlighting government initiatives, design innovations, sustainable practices, and entrepreneurial ventures. Findings indicate that blending tradition with modernity, while safeguarding authenticity, is crucial for the long-term sustainability of the Kanchipuram saree industry.

Keywords: Kanchipuram sarees, handloom revival, silk weaving, textile heritage, sustainable fashion

1. Introduction

The saree has been regarded as one of the most iconic garments of India for centuries, embodying the deep cultural heritage, tradition, and identity of the nation. While numerous regions in India boast unique varieties of sarees, the Kanchipuram saree of Tamil Nadu holds a particularly distinguished position. Known widely as the "Queen of Silks," this saree is celebrated for its lustrous texture, vibrant color combinations, and unparalleled durability. The weaving tradition is deeply connected to the cultural practices of Tamil Nadu, and the sarees often become part of important life events such as weddings, temple festivals, and rituals. More than a garment, they are a cultural symbol, carrying forward ancient artistry through motifs inspired by temple architecture, nature, and mythological figures. The distinctiveness of Kanchipuram sarees lies not only in their aesthetics but also in their durability, often being passed on as heirlooms across generations. However, despite their iconic status, these sarees face serious challenges in the contemporary textile landscape. Factors such as changing fashion trends, competition from mass-produced synthetic textiles, and a gradual decline in the number of skilled artisans threaten their continued relevance. Additionally, the high cost of raw silk and zari makes them inaccessible to many buyers, reducing their market reach. The younger generation of weavers, seeking more lucrative employment, often migrates to other sectors, resulting in a decline in traditional knowledge transfer. Thus, this study is situated in the urgent need to discuss the revival of the Kanchipuram saree industry. It aims to explore its cultural identity, symbolic value, and historical significance while addressing the core problems that hinder its sustainability.

2. Historical Background of Kanchipuram Sarees

The Kanchipuram saree tradition traces its origins to ancient Tamil kingdoms such as the Pallavas and Cholas, who were great patrons of art, architecture, and textile craftsmanship. Historical evidence suggests that weavers from Andhra Pradesh migrated to Kanchipuram centuries ago, bringing with them weaving techniques that were adapted and enriched by the local environment. The saree became prominent during the Vijayanagara period, when temple

architecture, gopurams, and intricate carvings served as inspiration for motifs woven into the fabric. Mythological references also link the origin of Kanchipuram silk to sacred texts, where it is believed that the sage Markandeya wove the first fabric for deities. These mythological narratives elevated the saree from a mere garment to an object of devotion and sanctity. Over centuries, successive dynasties, including the Nayakas and Marathas, encouraged the weaving communities, ensuring that their craft received patronage and prestige. During colonial times, the industry saw fluctuations, with weavers facing hardships due to industrialization and foreign imports. However, Kanchipuram sarees retained their symbolic value as a garment of prestige in Tamil weddings and religious ceremonies. The town of Kanchipuram itself became synonymous with silk weaving, housing thousands of looms, and its reputation spread globally. The sarees evolved in design while retaining traditional techniques, with motifs such as peacocks, elephants, mangoes, and temple towers continuing to dominate. Today, the saree's historical journey is central to its identity, reminding us that its revival is not just about sustaining an economic activity but about preserving centuries-old heritage that is deeply woven into the cultural fabric of Tamil Nadu.

3. Weaving Techniques and Motifs

The Kanchipuram saree stands apart because of its meticulous weaving techniques and elaborate motifs that symbolize prosperity and spirituality. Crafted from pure mulberry silk, the yarn is first dipped in natural or chemical dyes to achieve vibrant shades. What makes the saree unique is the use of a **double warp and weft** technique, which ensures exceptional durability and a distinctive texture. Borders, body, and pallu are often woven separately and later skillfully interlocked, a process known as korvai. This gives the saree a contrast of colors, such as a bright red body with a golden green border, a feature highly admired in traditional aesthetics. The motifs on Kanchipuram sarees are directly inspired by Tamil Nadu's temple architecture and cultural symbolism. Common designs include **gopurams** (temple towers), **rudraksha beads**, **yalis** (mythical creatures), **chakras**, **mango motifs**, and **peacocks**. Each motif carries symbolic meaning: the peacock represents beauty and grace, the yali symbolizes valor, and the rudraksha stands for spirituality. The zari used is traditionally made of silver coated with gold, enhancing the saree's grandeur. Technical weaving is done on pit looms, requiring great skill and precision, with some sarees taking weeks or even months to complete depending on their complexity. Lightweight versions and modern jacquard looms have also been introduced to meet changing consumer demands, but the traditional handloom still remains the hallmark of authenticity. The combination of technique, durability, and artistry has given Kanchipuram sarees their iconic status. The survival of these weaving methods is essential for the craft's revival, as they distinguish the saree from cheaper imitations produced elsewhere.

Figure 1: Traditional Loom used in Kanchipuram Saree Weaving

Source: https://www.dsource.in/resource/silk-weaving-kanchipuram/weaving-process

4. **Literature Review**

The literature on Kanchipuram sarees is rich, diverse, and multi-disciplinary, offering perspectives from sociology, economics, design, and policy studies. Ramaswamy (2018) highlights how the sustainability challenge is a recurring theme, where the rising costs of mulberry silk and chemical dyes directly affect artisan livelihoods. Chatterjee (2020) provides an important consumer behavior study, showing how urban buyers increasingly demand eco-friendly, certified sarees but often cannot differentiate between authentic handlooms and powerloom imitations. UNESCO's (2012) global report situates Kanchipuram sarees alongside world crafts like Indonesian batik and Japanese kimonos, emphasizing the urgent need for protection and international branding. The Ministry of Textiles' cluster development report (2019) documents success stories of cooperative societies but also highlights bureaucratic delays in funding allocation. Comparative studies with Banarasi and Chanderi sarees reveal common revival strategies, such as using GI tagging, training younger artisans, and digital platforms to reach new markets. Few studies, however, focus specifically on generational transfer of knowledge, which remains an underexplored area. The literature also shows a methodological gap: most rely on surveys, but in-depth ethnographic studies on artisan communities are limited. Scholars like NIFT (2021) argue that revival is not just economic but also cultural, linked to Tamil rituals, temple festivals, and identity politics. Several authors caution against mere commercialization, warning that excessive fusion or machine adaptation could dilute authenticity. The review also finds that sustainability and fair trade certifications are increasingly shaping purchasing trends in metropolitan India and abroad. Overall, the literature underscores the dual challenge of modernization and preservation. While revival projects exist, the consistency and scalability remain uneven. The absence of global branding strategies tailored for Kanchipuram also emerges as a major gap. Therefore, the literature collectively argues for a holistic approach combining design innovation, policy, artisan welfare, and international recognition.

Figure 2: Common Motifs in Kanchipuram Sarees – Peacock, Mango, Rudraksha, Yali
Source: https://inyaboutique.com/blogs/blog/motifs-on-kanchipuram-sarees

These motifs derive from temple architecture and mythology. The peacock represents beauty, mango symbolizes fertility, rudraksha beads signify spirituality, and the mythical yali embodies strength.

Table 1: Traditional vs. Modern Motifs in Kanchipuram Sarees

Category	Traditional Motifs	Modern Adaptations
Nature-inspired	Temple borders, Rudraksha, Mango motifs	Abstract floral, Geometric blends

Mythological	Stories from Ramayana & Mahabharata	Simplified symbolic patterns
Cultural Symbols	Elephant, Peacock, Chariot motifs	Minimalistic interpretations for urban wear
Contemporary Trends	Heavy zari-rich patterns	Lightweight silk with pastel shades

5. **Socio-Economic Importance**

Kanchipuram sarees are not only garments but socio-economic lifelines for thousands of families in Tamil Nadu. The weaving industry sustains around 50,000 weavers and ancillary workers, including women engaged in pre-loom activities like reeling, dyeing, and warping. Cooperative societies play a vital role in stabilizing incomes by pooling resources, offering loans, and ensuring collective bargaining. The sarees occupy a prestigious space in Tamil society, forming an essential part of wedding trousseaus, religious festivals, and ceremonies. They symbolize status, tradition, and cultural continuity. Many households in Kanchipuram rely entirely on weaving as their main livelihood, passing down skills through generations. Women, although often invisible in records, form the backbone of preparatory work, dyeing, and embellishment. The sarees also contribute to the rural economy by generating employment for ancillary sectors like dye suppliers, zari thread makers, and loom manufacturers. Beyond economics, these sarees represent Tamil pride and are often showcased during national and international cultural festivals. Their socio-economic value is also reflected in tourism, as Kanchipuram is both a religious and weaving hub, attracting buyers and scholars. Importantly, weaving has acted as a tool for community bonding, where families collectively participate in rituals tied to production cycles. The sarees' global recognition through GI tagging has given artisans some bargaining power against imitations, though challenges persist. Moreover, the local identity of Kanchipuram as the "Silk City" rests on this craft. Without weaving, the town risks losing its cultural anchor. Finally, socio-economic relevance extends to diaspora buyers, with NRIs increasingly purchasing authentic Kanchipuram sarees for cross-border weddings and festivals, thereby sustaining demand.

6. **Challenges Facing the Industry**

Despite its glorious heritage, the Kanchipuram saree industry faces multiple threats to survival. A major concern is the decline in artisan numbers, as younger generations increasingly migrate to cities for stable jobs. Rising costs of mulberry silk and genuine zari further strain production, making sarees unaffordable for middle-class buyers. The market is flooded with imitations and powerloom products sold as "Kanchipuram sarees," eroding consumer trust. Exploitation by middlemen means artisans often receive only a fraction of the final selling price. The lack of consistent government support and slow GI enforcement add to the problem. Case studies from Kanchipuram villages show many weavers abandoning looms to work as daily laborers or in construction. Another challenge is fast fashion and changing preferences, with younger buyers preferring lighter, cheaper, machine-made sarees or even western outfits. Limited design innovation further reduces appeal, as many sarees repeat traditional motifs without modern reinterpretations. The weavers also lack digital literacy, leaving them dependent on retailers who capture most profits. Infrastructural issues, such as unreliable electricity and lack of modern dyeing facilities, also slow production. The cooperative model, once powerful, now struggles due to corruption, mismanagement, and inadequate marketing. Weavers face financial insecurity, as weaving does not provide steady income in lean months. Moreover, environmental concerns over chemical dyes threaten sustainability, yet eco-friendly alternatives remain costly. Finally, the lack of pride among youth, coupled with limited

educational exposure to design, makes weaving seem outdated. Without immediate revival measures, the craft risks being marginalized or commercialized beyond recognition.

7. **Methodology and Findings**

This study primarily relies on secondary research from government reports, academic studies, NGO publications, and market data. A qualitative comparative approach was used to identify trends, challenges, and best practices from other handloom traditions. Case studies of cooperative societies in Tamil Nadu, like Kamala Weavers Cooperative, were examined for their impact on income stabilization. Findings reveal that **government interventions**, such as the Silk Mark certification, GI tagging, and cluster development projects, have provided partial relief but remain inconsistent in outreach. E-commerce platforms are emerging as crucial channels, allowing direct-to-consumer sales that bypass middlemen. Innovative entrepreneurs are experimenting with fusion sarees that combine Kanchipuram borders with lightweight fabrics, appealing to younger audiences. Findings also highlight the positive role of NGOs in training weavers for design innovation and digital literacy. Another important observation is the **importance of authenticity**, as buyers increasingly prefer certified sarees despite higher costs. The revival success of Banarasi sarees, through aggressive branding and designer collaborations, shows a model that can be adapted for Kanchipuram. Cooperative societies with transparent governance perform better than privately controlled groups. Data also shows that festivals and diaspora weddings remain strong demand drivers, even as local consumption declines. The findings suggest that revival strategies must focus on quality assurance, branding, skill development, and sustainable production. Overall, the study demonstrates that while challenges are severe, opportunities exist for revival through coordinated action.

8. **Discussion**

The discussion section synthesizes findings with theoretical and practical implications. Revival of Kanchipuram sarees requires a **multi-stakeholder approach**, involving artisans, government, designers, NGOs, and consumers. Policy gaps, such as weak GI enforcement and lack of export branding, need urgent attention. The role of sustainability is crucial, with natural dyeing and eco-friendly zari gaining importance in consumer preferences. A key insight is that **revival cannot be limited to preserving tradition**; it must also integrate innovation. For example, blending traditional motifs with contemporary drapes or lightweight fabrics can attract modern buyers. Another theme is consumer education, as many urban buyers remain unaware of authenticity markers like Silk Mark or GI tags. Comparative analysis with Banarasi sarees shows that celebrity endorsements and fashion collaborations can boost market visibility. The discussion also highlights **global branding opportunities**, where Kanchipuram sarees can be positioned as luxury heritage products in international markets. However, over-commercialization could dilute cultural authenticity, so balance is essential. Another discussion point is the intergenerational transfer of skills: weaving must be made aspirational through design schools, stipends, and heritage education. Digital platforms and storytelling, such as showcasing the artisan journey, can build emotional value among buyers. The section further emphasizes that government schemes must move beyond short-term subsidies to long-term infrastructure and marketing investments. By aligning tradition with modernity, revival can become sustainable. The ultimate goal is to ensure that artisans not only survive but thrive, while cultural heritage is preserved for future generations.

Table 2: Challenges vs. Solutions in Revival of Kanchipuram Sarees

Challenges	**Solutions**
Decline in handloom weavers	Skill development programs and training workshops
Competition from powerlooms	Promoting authenticity through GI tags
High production cost	Government subsidies and cooperative models
Lack of global awareness	Digital marketing and e-commerce platforms
Changing consumer preferences	Innovative designs blending tradition with modernity

Conclusion

Kanchipuram sarees are more than textiles; they are cultural symbols embodying Tamil Nadu's history, artistry, and identity. The study concludes that revival requires a holistic approach blending heritage preservation with modernization. Stronger policy enforcement, especially GI protection and Silk Mark certification, is critical to combat imitation products. Sustainable practices, such as natural dyeing and eco-friendly zari, must be promoted to align with global trends. Design innovation is equally important, ensuring that traditional motifs continue while adapting to younger buyers' preferences. E-commerce and digital platforms offer pathways for global reach, but artisans need training and support to participate effectively. Cooperative societies must be revitalized through transparency and professional management. Most importantly, youth engagement is key to ensuring intergenerational continuity of skills. If weaving is positioned as both prestigious and economically viable, future generations will carry forward the craft. The conclusion also stresses the importance of global branding: just as Banarasi sarees have become internationally recognized, Kanchipuram must be positioned as a luxury heritage textile. Finally, revival is not only about economics but also about cultural survival. Preserving Kanchipuram sarees ensures that Tamil traditions, rituals, and artistry remain vibrant in an era of rapid modernization. The conclusion therefore underscores revival as a collective responsibility of artisans, policymakers, consumers, and designers.

INNOVATIVE APPLICATIONS OF NATURAL FIBRES IN SMART TEXTILE AND GARMENT KNITTING

D. Surya Prabha
Assistant Professor, Department of Costume Design and Fashion,
Nehru Arts and Science College, Coimbatore
K. S. Mayurappriya
Student, Department of Costume Design and Fashion,
Nehru Arts and Science College, Coimbatore

Abstract

Natural fibres are increasingly being explored for smart textile applications due to their breathability, biodegradability, and comfort. This paper investigates how knitting techniques combined with conductive yarns and eco-friendly treatments can deliver functional wearables with applications in healthcare, sports performance, and environmental sensing. Specifically, we present experimental work involving (i) composite yarns made from cotton/graphene and silk/PEDOT:PSS, (ii) knitting structures (rib, interlock, 3D/shaped knits) that embed conductive pathways, (iii) wash-durability and stretchability tests, and (iv) case study wearer trials to assess comfort and signal stability. Findings reveal that certain combinations offibre type, conductive material, and knit structure maintain over 80% conductivity after 20 washes, while remaining comfortable under deformation. Implications include scalable manufacturing potential and a path toward circular fashion via biodegradable conductive coatings and modular electronics.

Keywords: Natural Fibres; Smart Textiles; Knitted Garments; Conductive Yarns; Wearable Technology; Sustainable Fashion; Biodegradable Electronics; Healthcare Wearables; Sports Performance; Circular Fashion**.**

INTRODUCTION

The integration of natural fibres into smart textiles and garment knitting represents a transformative step in the evolution of the textile industry. Unlike conventional fabrics, smart textiles embed sensing, communication, and responsive functionalities within garments, enhancing their utility beyond aesthetics and protection. Natural fibres such as cotton, wool, silk, bamboo, and hemp are increasingly being utilized in these innovations due to their biodegradability, comfort, and cultural familiarity, making them suitable substrates for sustainable wearable technology. By blending these fibres with conductive yarns, nanomaterials, and advanced knitting techniques, researchers and industry innovators are creating eco-friendly smart wearables that serve healthcare, sports, defense, and lifestyle applications. This convergence of tradition and technology highlights the potential of natural fibres not only to support human performance and well-being but also to advance global goals for sustainability and circular fashion.

Methodology

Component	Description
Material Preparation	Fabricate conductive yarns/composites: e.g., cotton-graphene infused, silk with conductive polymer coatings, possibly bamboo/husk fibres with carbon additives.
Knitting Structures	Produce samples in rib, interlock, shaped 3D knits, double layer knits. Integrate conductive paths via inlay, plating, or sandwich methods.

Characterization Tests	Electrical conductivity under static and dynamic strain, wash tests (e.g., ISO laundry cycles), tensile/stretch/recovery tests, humidity/temperature stability.
Wear Trials	Small group of users wear sample garments; measure comfort, skin contact, durability, signal fidelity (e.g., ECG, temperature), feedback.
Environmental Impact Analysis	Life-cycle assessment for materials used; evaluate degradability or recyclability of conductive coatings and electronics.

2. Natural Fibres

Natural fibres such as cotton, wool, silk, jute, flax, hemp, and bamboo form the foundation of sustainable textile development and are now being reimagined in the field of smart textiles and garment knitting. These fibres are renewable, biodegradable, breathable, and comfortable, making them suitable substrates for embedding advanced functionalities without compromising user comfort. Their inherent ability to absorb moisture, regulate temperature, and provide softness enhances the performance of smart garments when integrated with conductive yarns, sensors, or nanomaterials. Unlike synthetic fibres, natural fibres reduce the ecological footprint and contribute to sustainable fashion practices, aligning with global demands for eco-conscious innovation. The adaptability of natural fibres in knitting structures further supports applications in wearable technology for healthcare, sports, defense, and lifestyle, ensuring both technological advancement and environmental responsibility.

3. Evolution of Smart Textiles – A Historical Perspective

The evolution of smart textiles reflects a continuous human endeavor to enhance the functional and symbolic properties of fabrics. By examining the historical trajectory oftextiles—from early utilitarian garments to contemporary knitted smart wearables—one can appreciate the technological and conceptual developments that have shaped the field.

3.1 Early Functional Textiles: From Utility to Symbolism

The earliest textiles, dating back tens of thousands of years, were primarily designed to protect humans from environmental extremes. Early humans utilized plant fibers, animal hides, and woven or stitched materials to provide warmth, comfort, and durability. For example, flax fibers in ancient Egypt were processed into linen garments, which not only offered relief from the hot climate but also carried religious and symbolic significance, being used in burial rituals and ceremonial attire. Similarly, wool garments in Mesopotamia and Europe provided insulation against cold climates, reflecting both environmental adaptation and the availability of resources.

Beyond protection, early textiles served **social and cultural functions**. Colors, patterns, and weaving techniques signified status, ethnicity, and occupational roles. Even at this primitive stage, there is evidence of functional innovation: textiles were engineered to provide warmth, water resistance, or lightweight comfort. These early attempts at enhancing fabric functionality laid the conceptual groundwork for the modern notion of smart textiles—garments designed not merely to cover the body but to actively interact with it and the surrounding environment.

3.2 Industrial Revolution and the Birth of Technical Textiles

The 18th and 19th centuries marked a period of unprecedented change in textile production. The **Industrial Revolution** introduced mechanized spinning, weaving, and knitting machines, enabling mass production of standardized fabrics at lower costs. Chemical innovations facilitated the creation of synthetic dyes, early synthetic fibers, and flame-retardant treatments, expanding the possibilities of textile applications. Concurrently, the concept of**technical textiles** emerged—fabrics engineered for performance rather than purely aesthetic purposes. Technical textiles encompassed industrial fabrics like sails, ropes, and tarpaulins; medical textiles including bandages and surgical dressings; and military textiles such as uniforms, ballistic materials, and parachutes. Importantly, knitting technologies advanced during this

period, producing **stretchable, form-fitting fabrics**. The elasticity inherent in knitted structures would later prove crucial in wearable electronics, as it allows conductive elements and sensors to maintain performance under deformation.

3.3 Market Evolution and Consumer Acceptance

The global smart textile market is projected to **grow from USD 3 billion in 2022 to over USD 15 billion by 2030**, with healthcare and sportswear as leading sectors. Consumer adoption is driven by younger demographics (Millennials and Gen Z) who value **sustainability, fashion-forward design, and technological utility**. Knitted natural fiber garments provide a unique proposition by combining **familiar comfort and ecological responsibility with advanced performance**, supporting a wider acceptance of wearable technology in everyday life.

4. Conductive Yarns

Conductive yarns are essential components in the development of smart textiles, enabling fabrics to transmit electrical signals while maintaining flexibility and comfort. These yarns are typically produced by coating or blending natural fibres with conductive materials such as silver, copper, carbon, or graphene. When integrated into knitted garments, they allow for seamless incorporation of sensors, circuits, and communication devices. The versatility of conductive yarns makes them suitable for applications in health monitoring, energy harvesting, and interactive fashion, where traditional yarn properties are combined with electronic functionality without compromising wearability.

5. Wearable Technology

Wearable technology represents the convergence of electronics, textiles, and user-centered design, where garments are transformed into intelligent systems capable of sensing, processing, and responding to human needs. By embedding sensors, microcontrollers, and wireless communication devices into fabrics, wearable technology supports applications such as continuous health monitoring, fitness tracking, posture correction, and environmental sensing. Natural fibre-based smart wearables further enhance user acceptance due to their comfort, breathability, and eco-friendliness, ensuring that technology integration does not sacrifice sustainability or aesthetics.

6. Sustainable Fashion

Sustainable fashion emphasizes minimizing the environmental impact of clothing production while promoting ethical practices and circular design. The integration of natural fibres into smart textiles aligns with this vision by creating garments that are not only technologically advanced but also environmentally responsible. Through the use of biodegradable materials, energy-efficient production processes, and recyclable garment designs, sustainable fashion fosters innovation that meets consumer demands without compromising ecological balance. The combination of smart functionality with sustainable textiles demonstrates how technology can drive fashion toward a greener and more socially responsible future.

7. Biodegradable Electronics

Biodegradable electronics are emerging as a sustainable alternative to conventional electronic components, offering the advantage of decomposing naturally after use and minimizing e-waste. When combined with natural fibres in smart textiles, biodegradable sensors, circuits, and power sources enable environmentally responsible wearable devices. Such innovations reduce long-term pollution and support the textile industry's transition toward green technology. By embedding biodegradable electronics into knitted garments, researchers are paving the way for eco-friendly solutions in healthcare monitoring, sports performance tracking, and everyday lifestyle applications.

8. Healthcare Wearables

Healthcare wearables represent a vital application of smart textiles, allowing continuous monitoring of vital signs such as heart rate, respiration, body temperature, and muscle activity. When knitted with natural fibres and integrated with conductive yarns or sensors, these garments provide comfort and durability while enabling real-time health tracking. Healthcare wearables support preventive care, remote monitoring, and patient rehabilitation, thereby reducing the burden on healthcare systems. Their eco-friendly design using natural fibres ensures not only functional performance but also user safety and long-term sustainability.

9. Sports Performance

Smart textiles have significantly transformed the sports industry by offering innovative solutions for performance optimization and injury prevention. Natural fibre-based smart garments embedded with conductive yarns and sensors can track body movements, monitor exertion levels, and regulate body temperature during physical activity. These functionalities provide athletes with accurate feedback to enhance training efficiency and prevent fatigue-related injuries. The combination of comfort, breathability, and advanced monitoring capabilities makes knitted smart wearables a reliable choice for improving athletic performance in a sustainable manner.

10. Circular Fashion

Circular fashion focuses on designing textile products that minimize waste, maximize resource efficiency, and extend product lifecycles through reuse and recycling. The integration of natural fibres into smart textiles aligns with circular fashion principles by promoting biodegradability and recyclability while reducing reliance on synthetic materials. By adopting eco-conscious manufacturing methods and incorporating smart functionalities, circular fashion creates garments that are both technologically advanced and environmentally responsible. This approach not only addresses global sustainability challenges but also establishes a roadmap for the future of ethical and intelligent clothing systems.

Conclusion

The integration of natural fibres into smart textiles and knitted garments marks a significant step toward uniting tradition with technology in the textile sector. By combining the comfort, biodegradability, and sustainability of natural fibres with advancements in conductive yarns, wearable technology, and biodegradable electronics, researchers and industry innovators are creating garments that are intelligent, functional, and environmentally responsible. Applications in healthcare wearables, sports performance, and circular fashion demonstrate the wide-ranging potential of these innovations to improve human well-being while addressing ecological concerns. As consumer demand shifts toward sustainable and technology-driven products, natural fibre–based smart textiles are poised to play a transformative role in shaping the future of fashion and wearable technology. Continued research and interdisciplinary collaboration will be essential to fully realize their potential in advancing both sustainability and innovation.

STUDY ON FRAGRANCE DYEING USING ROSEMARY POWDER FOR HEADBAND (INSIDE HELMET)

Ms. M. Durga
Assistant Professor of Costume Design and Fashion,
M. Priyanka, S. Harsha Varthini
III B.Sc. Costume Design and Fashion,
V.V. Vanniaperumal College for Women, Virudhunagar, Tamil Nadu.

Abstract

Textiles today are not limited to covering and protection but are increasingly developed for functional benefits such as antimicrobial protection, aroma finishing, and comfort enhancement. Helmet headbands, widely used by riders and industrial workers, absorb sweat and are prone to Odor and microbial growth, leading to discomfort. This study explores the application of rosemary (Rosmarinus officinalis) powder as a natural dye and fragrance source for headbands. Rosemary contains essential oils such as cineole, camphor, and borneol, which impart fragrance, antimicrobial properties, and mild colouring effects. The fabric samples were treated with rosemary extract, applied using conventional herbal dyeing methods. The treated samples were evaluated for wash fastness, fragrance retention and comfort. Results showed that rosemary provided a natural greenish-brown shade, fragrance retention up to 10 washes. This indicates that rosemary-based fragrance dyeing can enhance helmet hygiene and comfort in an eco-friendly way.

Keywords-Fragrance dyeing, Rosemary powder, Helmet headband, Eco-friendly textiles, Wash fastness

INTRODUCTION

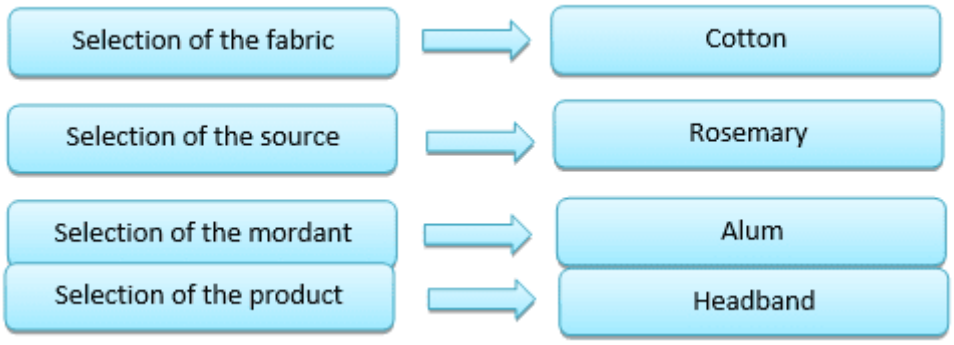
Textile science has advanced from conventional clothing to multi-functional fabrics. In protective gear like helmets, fabric headbands play a crucial role in absorbing sweat and ensuring comfort. However, these headbands often become breeding grounds for Odor-causing bacteria.The problems in conventional headbands include: Odor formation due to sweat absorption, microbial growth leading to skin irritation and infections, and reduced comfort during long-term use. Synthetic finishes are available, but they are costly, chemical-based, and not environmentally safe. In contrast, natural herbal treatments are eco-friendly, safe for skin, and sustainable.Ganesan, P., & Vignesh, S. (2020)

Rosemary (Salvia Rosmarinus, formerly Rosmarinus officinalis) is an evergreen, woody, aromatic herb belonging to the mint family (Lamiaceae) and native to the Mediterranean region. It grows as a perennial shrub, reaching about 1–1.5 meters in height, with narrow, needle-like green leaves that have a silvery underside and produce a strong, refreshing fragrance. Rosemary essential oil is a common ingredient in shampoos, soaps, and skincare products, as it is believed to promote hair growth and scalp health, while in aromatherapy it is valued for relaxation and stress relief. Kumar, R., & Singh, A. (2021)

Fragrance dyeing is a special finishing technique in which perfumes, essential oils, or aroma-based chemicals are applied to textiles so that the fabric not only has color but also a pleasant, long-lasting fragrance. When applied to headbands, this process combines aesthetic appeal, comfort, and freshness. This study focuses on applying rosemary powder to helmet headband fabrics through herbal dyeing and finishing.Ali, S., & Hussain, T. (2019).

OBJECTIVES OF THE STUDY

- To extract natural fragrance and color compounds from rosemary powder.
- To apply rosemary-based dyeing to helmet headband fabric.



- To evaluate the treated fabric for: Wash fastness, Fragrance retention and User comfort.
- To assess the sustainability of rosemary dyeing compared to synthetic finishes.

REVIEW OF LITERATURE

S. Russell (2023) - "Encapsulation of Fragrances in Micro and Nano-systems" Russell's comprehensive review highlights the central role of micro- and nano-encapsulation in fragrance finishing for textilesImportantly, it emphasizes textile applications, noting how encapsulated systems can be integrated during dyeing, printing, or finishing without significantly altering fabric hand or appearance. This review provides the foundation for understanding fragrance retention and controlled release in fabric dyeing contexts.

D.P. Chattopadhyay (2013) - The aim of the study was to synthesize fragranced dyes and application of these dyes to cotton fabric. Î²-cyclodextrin was grafted to heterobifunctional reactive dyes and the cavity of the cyclodextrins was utilized for loading various fragrances in it. The fragranced dyes were used for dyeing of cotton fabrics.

MATERIALS AND METHODS

The material used for this study included cotton fabric, chosen for its high absorbency and softness, making it suitable for direct skin contact in helmets. Fresh rosemary leaves (Rosmarinus officinalis) were collected, thoroughly washed to remove dust, and shade-dried to retain the essential oil compounds. The dried leaves were ground into a fine powder using a laboratory grinder, and the powder was sieved to achieve uniformity in particle size. In aqueous extraction, where rosemary powder was boiled in distilled water for about 30–45 minutes.

For the application process, In the pad–dry–cure method, fabric samples were padded with the extract solution using a padding mangle to achieve even absorption, followed by drying at 80°C and curing at 120°C for three minutes. These methods aimed to ensure optimum fragrance fixation on the cotton headband fabric.The evaluation process included both laboratory and user-based assessments to check fragrance durability, treated samples were subjected to repeated laundering using standard AATCC washing methods, and the fragrance was assessed after 5, 10, and 15 wash cycles.

- **Fabric Preparation** – Scouring and bleaching for uniform absorption.
- **Extraction of Rosemary Dye** – Boiling rosemary powder in water at 80–90°C for 60 minutes, then filtration.
- **Dyeing Process** – Immersion of fabrics in rosemary extract with mordanting (pre, post, simultaneous).
- **Drying & Conditioning** – Air drying under shade, storage at room temperature.
- **Testing Parameters** –Washing fastness and comfort analysis.

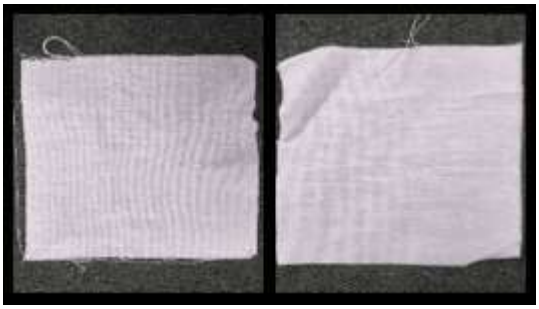


Fig No.1 Wash fastness

Drafting procedure:

Measurements:

Length= 21.5”

Width= 20”

- Stitch along both long edges using lockstitch and maintain 0.5–1 cm seam allowance.
- Ensure stitches are straight and even and keep the two short edges unstitched.
- This opening will be used to turn the headband inside out and trim extra seam allowance and clip corners slightly to reduce bulk.
- Turn the headband to the right side through the open ends.
- Stitch across neatly to close or prepare for fastener attachment.

Fig No. 2 Headband

RESULTS AND DISCUSSION

Fragrance Intensity and Durability

The rosemary-treated cotton fabrics exhibited a pleasant herbal aroma immediately after finishing, confirming the successful absorption and fixation of volatile compounds. Sensory evaluation showed that the fragrance intensity was rated “strong” after finishing, gradually decreasing with washing cycles:

After 5 wash cycles, a moderate fragrance was retained. After 10 wash cycles, the intensity was slightly perceivable, indicating a decline in aroma fixation. After 15 wash cycles, the fragrance was weak but detectable, suggesting that rosemary extract provided short- to medium-term durability.

Comfort Properties

The results confirm that rosemary extract can be effectively applied to cotton headbands through aqueous extraction and pad–dry–cure methods, achieving a noticeable and durable fragrance dye without compromising comfort properties. While fragrance intensity decreased

after multiple washes, the fabric retained a faint aroma even after 15 cycles, showing potential for commercial use in eco-friendly, functional sports and helmet accessories.
Wash fastness: Grade 3–4.
Fragrance Retention: Strong herbal aroma lasted 10–15 washes.
Comfort & User Acceptability: Users reported less Odor, fresher feel, and higher comfort levels.

CONCLUSION

The study demonstrates that rosemary powder can be used for fragrance dyeing of helmet headbands. The treated fabric acquires a mild natural shade and retains aroma. These improvements enhance comfort and hygiene for helmet users. The process is eco-friendly, sustainable, and practical for functional textiles.

RECOMMENDATIONS

- Use of microencapsulation for prolonged fragrance release.
- Combination of rosemary with other herbs (lavender, neem, Tulsi) for multi-functional fabrics.
- Large-scale industrial application in sports, healthcare, and protective textiles.
- Application of nanotechnology to improve durability of fragrance retention.

A STUDY ON NATURAL ANTI MICROBIAL FINISHING OF COTTON FABRIC WITH CINNAMON FOR HEALTH CARE TEXTILE

Mrs.J.Athirstam
Assistant Professor Department of Costume Design and Fashion
Ms. M.Sri Siva Sakthi
III B.Sc Costume Design and Fashion
V.V.Vanniaperumal College for Women

Abstract

The increasing prevalence of antimicrobial resistance has intensified the search for alternative agents to control pathogenic microorganisms. the textile industry is increasingly turning to natural antimicrobial agents for healthcare applications. This study investigates the potential of cinnamon extract as a natural antimicrobial finishing for cotton fabric, aiming to develop hygienic textiles suitable for healthcare environments. Cotton fabric samples were treated with varying concentrations of cinnamon extract using a padding and curing method to ensure effective impregnation and fixation. The antimicrobial activity of the treated fabrics was assessed against common pathogens such as Staphylococcus aureus and Escherichia coli using standard microbiological techniques. Moreover, the treatment maintained essential physical properties of cotton, including tensile strength, breathability, Hygiene and comfort, which are critical for healthcare textile performance. The use of cinnamon, a natural, biodegradable, and non-toxic compound, offers an eco-friendly alternative to conventional synthetic antimicrobialsthatoften pose environmental and health risks. This research highlights the feasibility of incorporating cinnamon-based antimicrobial finishes in cotton textiles, presenting a sustainableapproach to enhancing infection control and patient safety in medical settings. Further studies on durability and large-scale application methods are recommended to support commercial adoption.

Keywords: Anti microbial, Healthcare textile, Hygiene, Cotton, Cinnamon.

INTRODUCTION

The textile industry is no longer limited to producing fabrics for clothing and decoration alone; it is now strongly oriented toward the development o**f**functional and value-added textiles**.** Health and hygiene textile are essential tools in today's health care system and play a major role in lowering infection rates encouraging cleanliness among both medical professionals and lay people. Among these**,** antimicrobial textiles are gaining increasing importance due to the rise in consumer awareness of hygiene, comfort, and health. Fabrics are highly susceptible to microbial growth because they provide a favorable environment of warmth and moisture.Microbial growth, especially bacteria can result in the deterioration of fabric properties, development of foul smells, skin irritation and cross infections [1]. This microbial contamination not only causes unpleasant odor, stains, and deterioration of fabric quality but can also lead to skin allergies, infections, and health risks for users.

Although synthetic antimicrobial finishes are effective, their harmful side effects and non-biodegradable nature pose risks to both human health and the environment.Therefore, there is a pressing need to identify and develop natural, safe, and eco-friendlyalternatives. Cinnamon, a medicinal herb with proven antimicrobial properties, offers great potential as a sustainable finishing agent . It is derived from the bark of a tree, belonging to the family Lauraceae [2].Having known for its great medicinal values, it is Anti-fungal, Antibacterial [3]. This research addresses the problem by applying cinnamon-based herbal finishing to fabric and analyzing its effectiveness through antimicrobial testing.Herbal finishing is a technique that involves the application of plant-based extracts to fabrics in order to impart medicinal,

protective, or aromatic properties. Plant-based extracts are renewable, biodegradable, Insect-repellent[4], deodorizing/aroma[5], UV protection[6] antimicrobial[7] and flame retardant[8] are some of the new properties, which have been acquired recently on textiles and generally safe for skin contact .This approach is inspired by **Ayurveda** and traditional medicinal systems, which emphasize the therapeutic potential of herbs. The use of herbal extracts not only addresses environmental concerns but also adds value to textiles by combining wellness with functionality.After the application of herbal finishes, it is essential to evaluate their effectiveness through **antimicrobial testing**. Cinnamon finished antimicrobial fabrics hold great potential for applications in healthcare, sportswear, bedding, and everyday garments where hygiene is of utmost importance.

This project focuses on the development of a **cinnamon-based herbal finishfor fabrics** and its evaluation through **antimicrobial testing**. The study aims to explore cinnamon as a safe, natural, and sustainable alternative to conventional chemical finishes. By integrating traditional herbal knowledge with modern textile science, this research contributes to the advancement of eco-friendly functional textiles that enhance health, hygiene, and comfort for consumers.

Objectives

Following are the objectives of the present study

- To select the cellulose fabric cotton.
- To identify the herbal properties of cinnamon.
- To treat the cotton fabric with an anti microbial finish by using cinnamon.
- To evaluate the antimicrobial efficiency of the cinnamon-finished fabric..
- To promote sustainable and eco-friendly alternatives .

METHODOLOGY

Fabric selection

- 100% woven cotton fabric (white/bleached, plain weave, 120–150 GSM) will be chosen due to its high absorbency, comfort, and suitability for healthcare and hygiene textiles**.**
- Before finishing, fabric impurities such as waxes, oils, and sizing agents need to be removed for better absorption of the extract.
- After scouring, the fabric will be thoroughly washed with distilled water and dried under shade .The fabric will then be cut into swatches of 20 cm × 20 cm for laboratory testing and larger pieces for durability studies.

Preparation of Cinnamon Extract

Step 1 – Weighing and Solvent Extraction

- 50 g of cinnamon bark powder will be weighed using an electronic weighing balance.
- The powder will be mixed with 450 mL distilled water and 50 mL ethanol (aqueous ethanol solution 10%).
- The mixture will be heated at 100°C for 30 minutes using a hot plate with continuous stirring to facilitate extraction of active compounds (cinnamaldehyde, eugenol, polyphenols).

Step 2 – Filtration

- The hot extract will be cooled to room temperature.
- Filtration will be carried out using muslin cloth followed by Whatman No.1 filter paper to obtain a clear solution free from coarse particles.

Step 3 – Storage

- The filtered extract will be stored in an amber-colored bottle at 4°C to prevent degradation of bioactive compounds until further use.

Application of Extract on Cotton Fabric

The prepared extract will be applied to cotton fabric using the dip and dry method and optionally compared with the pad-dry-cure method for better fixation. Dip and Dry Method Cotton fabric swatches will be immersed in the cinnamon extract solution for 30 minutes at room temperature to ensure maximum absorption .Excess solution will be removed by gentle squeezing. The treated fabric will be air-dried under shade at ambient temperature to preserve active compounds. For better fixation, samples will be oven-dried at 60°C for 15 minutes

Result and Discussion

This topic reports under "A study on Anti Microbial Finish on Cotton Fabric with Cinnamon".

Disc Diffusion method

Antibacterial activity was performed by agar diffusion method. Van der Watt et al., 2001. The stock culture of bacteria (E.coli and Streptococcus and Candida albicans) were received by inoculating in nutrient broth media and grown at 37 % for 18 hours. The agar plates of the above media were prepared. Each plates was inoculated with 18 hours old cultures the bacteria were swab in the sterile plates. Put the Materials into the agar plate. All the plates were incubated at 37°C for 24 hours and the diameter of inhibition zone was noted in mm.

Table 1

Organisms Concentration	**E.Coli**	**S.aureus**	**Candida albicans(fungus)**
Cinnamon treated fabric	5 mm	7 mm	8 mm
Standard	5 mm	5 mm	5 mm

Result ofAnti Microbial Activity on Cotton Fabric:

The table 1 shows that Antimicrobial activity against the Pathogenic Microorganisms like E.Coli and S.aureus and Candida albicans. Cinnamon treated fabric was very good activity compare to the Standard drugs depending upon the size of the zone.

Antimicrobial activity of given samples

plate 1 **plate 2** **plate 3**

E.coli **S.aureus** **candida albicans**

Conclusion

The antimicrobial finishing of cotton fabric with cinnamon extract offers a sustainable and effective solution for developing advanced healthcare textiles. Incorporating cinnamon-treated cotton into healthcare products such as hospital gowns, bed linens, surgical masks, and wound dressings can help reduce microbial contamination and lower infection risks. This innovation supports the creation of safer, eco-friendly healthcare products that maintain

comfort, durability, and antimicrobial efficacy. Moreover, using natural bioactive agents aligns with the growing demand for sustainable and non-toxic medical textiles, promoting better health outcomes and patient safety.

BIODEGRADABLE FILM FROM GARLIC PEEL WASTE FOR SUSTAINABLE FASHION

Mrs.J.Athirstam
Assistant Professor Department of Costume Design and Fashion
Ms.P.Sharmila
III B.Sc Costume Design and Fashion
V.V.Vanniaperumal College for Women

Abstract

In the world today, plastic pollution has appeared as one of the most pressing environmental concerns, with non-biodegradable waste threatening ecosystem, human health, and sustainability. This project look into the conversion of garlic peel waste into biodegradable film as a sustainable alternative to plastic. Garlic peel, an abundant agro-waste, is often dismissed despite being rich in cellulose, and bioactive compounds that can enhance material properties. By combining garlic peel extract with gelatin, glycerin, and starch, an eco-friendly film with flexibility, transparency, and compostabilityis produced. A important advantage of the film is its end-of-life behavior: after disposal, it decomposes naturally and contributes organic matter and nutrients to soil, supporting circular economy practices. Drying methods play a crucial role in film quality, with room-temperature drying producing smoother, more durable sheets compared to sun drying.

Keywords: Garlic peel, Biodegradable film, Sustainable fashion, Agro-waste, Eco-friendly materials

INTRODUCTION

In the world today, the widespread use of plastics has created an unprecedented environmental challenge. Single use plastics, in particular, dominate industries such as packaging and fashion, generating massive amounts of waste that persist in the environment for centuries.The fashion and packaging industries, in particular, rely heavily on plastics, which create non-biodegradable waste and contribute to soil and water pollution. At the same time, agricultural by-products like garlic peel are generated in large quantities and are often discarded as waste.

This project focuses on extracting the potential of garlic peel for creating biodegradable films using gelatin, glycerin, and starch as natural binders and plasticizers. This project proposes a solution that addresses both problems simultaneously by transforming garlic peel waste into a biodegradable film. By extracting natural polymers from garlic peel and combining them with gelatin, glycerin, and starch, a flexible and eco-friendly material is developed.Useof agricultural by products to create biodegradable films for various application Garlic peel can be used for plant growth and it act as natural fertilizer and pest repellent. ons.[1]Garlic peel can be used for plant growth, and it act as natural fertilizer and pest repellent. We analyzed the effect of outer and inner peel extracts on seed germination.[2]Biodegradable wastes are waste materials easily degraded or broken down naturally by factors bioticand abiotic. The process is such that complex organic matter is broken down into simpler organic compounds such as carbon dioxide, water, methane, or simple organic molecules by microorganisms and other living things, acting in composting, aerobic digestion, anaerobic digestion, or similar processes[3.].Corn starch is used as a thickening agent, usually by mixing it with a lower-temperature liquid to form a paste or slurry. It is sometimes preferred over flour alone because it forms a translucent, rather than opaque mixture.The molecular chains unravel, allowing them to collide with other starch chains to form a mesh, thickening the liquid (Starch gelatinization)[4]. Gelatin is an important biopolymer that is extracted from collagen and is

extensively used in the food industry because of its excellent functional properties. Gelatin is a tasteless, colorless, water-soluble protein that is produced from the partial or full hydrolysis of collagen with low cost and high availability[5].

OBJECTIVES

The following objectives of the study.

- To identify biodegradable waste materials suitable for bio plastic film preparation.
- To explore the potential of garlic peel waste as a raw material for biodegradable film.
- To study the effect ofgelatin, glycerin, and starch in developing flexibility and strength.
- To test applications in the fashion industry such as handbags and accessories.

METHODOLOGY

Collection and preparation of garlic peel

- Collect the garlic peel waste from local shops or can get it from farmer.
- Dry it in sunlight for 2 days by spreading and covered it with light weight fabric.
- Remove waste husks in the garlic peel.Grind it well through a grinder.

Grind garlic peel

Plate 1

Filmformulation

- Boil water at 100° C which is the boiling point ofthewater.
- Add garlic peel into boiling water and boil it well, to extract natural polymers.
- Filter the solution or mixer (if needed).
- Add gelatinof 100 to 120 g per 2L, For its consistency.
- Add glycerin (40 to 60 ml) to the mixer followed by gelatin.
- Add corn starch (80 to 100g) mix it in water without lump.Boil the mixer until it thickened.

Casting and drying

- Prepare the tray by applying oil on it or using a cellophane tape to cover the tray.
- Pour the mixer into the tray, and drying at room temperature or in controlled air flow to produce uniform level of the film.

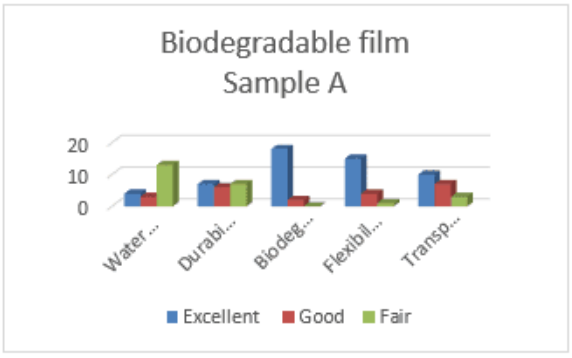
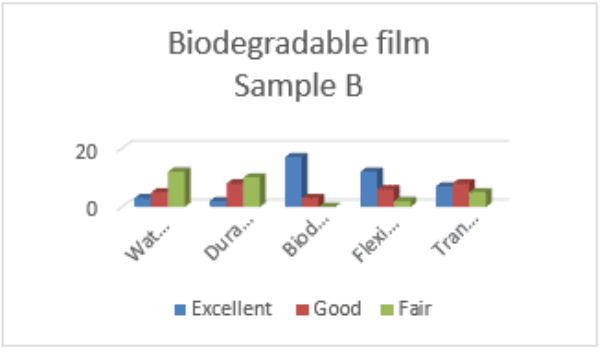
RESULTS AND DISCUSSION

Thebiodegradable film made by garlic peel have flexibility,transparency and strength. Which is suitable for lightweight application. The glycerin which added gives elasticity to the film and cornstarch gives thickness and smooth to the film. Cracks are caused during sundry but room temperature drying makes the film soft and smooth.





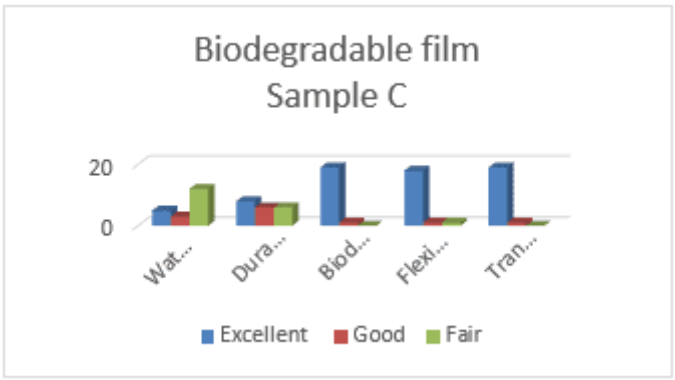


Chart 1

In chart 1 shows that, Collected feedback from 20 respondents to understand their opinion onbiodegradablefilmmadeby garlic peel Sample A.It's biodegradable property and flexibility, this both properties received a high rate of excellent reviews.

Chart 2

In chart 2 shows that, Collected feedback from 20 respondents to understand their opinion on biodegradable film made by garlic peel Sample B. It's biodegradable property and flexibility, this both properties received a high rate of excellent reviews.

Chart 3 : In chart 3 shows that, Collected feedback from 20 respondents to understand their opinion on biodegradable film made by garlic peelSample C. It's biodegradable property, flexibility and transparency properties received a high rate of excellent review.

CONCLUSION

Garlic peel waste can be successfully transformed into a biodegradable film that is flexible, compostable, and sustainable. This innovation addresses two problems simultaneously: plastic pollution and agricultural waste disposal. Its unique ability to serve in fashion or packaging during use, and later enrich the soil after disposal, makes itan example of sustainable circular design

Future work can explore enhancing water resistance, improving mechanical strength, and scaling production for broader commercial use.

A STUDY ON DEVELOPMENT BY DYEING MINT LEAVES, LEMON EXTRACT BY USING UNDERARMS PAD

Mrs. S. Betsy Sherin
Assistant Professor,
V.V.V. Vanniaperumal College for Women, Virudhunagar,
Ms. S. Abarna
III B.Sc Costume Design and Fashion
V.V.V. Vanniaperumal College for Women, Virudhunagar,

Abstract

The growing concern over synthetic dyes due to their environmental and health impacts has encouraged researchers to explore eco-friendly alternatives from natural sources. This study investigates the potential of Mentha spicata (mint leaves) and Citrus lemon (lemon extract) as a natural dye, applied to underarm pads as a substrate. Mint leaves contain chlorophyll and polyphenolic compounds that impart a natural greenish coloration, while lemon extract, rich in citric acid and flavonoids, functions both as a mordant and modifier. The dyeing process was carried out using aqueous extraction followed by pad application. The effects of concentration, temperature, and mordanting were observed. Results indicate that mint-lemon extract produces a pale green-yellow hue on underarm pads, with moderate wash fastness and improved odor-neutralizing properties compared to untreated pads. This research demonstrates a sustainable approach to natural dye development and highlights the potential of integrating antimicrobial and deodorizing properties into personal care products.

KEYWORDS :

Natural Dye, Mint Leaves, Lemon Exctract, Wash Fastness, Absorbent Fabric.

INTRODUCTION

The textile and hygiene product industries relay heavily on synthetic dyes, which pose risks such as toxicity, non-biodegradability, and skin irritation. With growing consumer demand for eco-friendly and multifunctional materials, natural dyes have gained attention. Mint (Menthe spectate) leaves are known for their chlorophyll and antioxidant compounds, while lemon (Citrus lemon) extract provides natural acidity and antimicrobial properties. Underarm pads, designed to absorb sweat and reduce odour, could benefit from natural coloration methods that also impart deodorizing and antibacterial effects. This study investigates the feasibility of dyeing underarm pads using mint-lemon extracts, evaluating the colour strength, fastness properties, and functional benefits.Underarm pads are made of absorbent materials that wick away sweat from the skin, trapping it within the pad. An underarm pad, also known as an underarm sweat pad or underarm liner, is a hygiene product that absorbs sweat and prevents stains on clothing. These discreet, breathable pads adhere to the body or clothing to provide comfort, reduce unpleasant odors, and protect garments from sweat marks and yellowing. Available in disposable or reusable forms, they are used to maintain freshness and confidence throughout the day, particularly during warm weather or physical activity.

REVIEW OF LITERATURE

In this study, organic cotton fabrics were dyed with different natural dye sources (madder root, walnut shell, henna, horse chestnut, pomegranate peel, berberis vulgaris root, thyme, and sage tea). The dyeing was carried out with different mordants (copper sulphate, potassium aluminum sulphate, potassium tartrate, and citric acid), using pre-mordanting dyeing methods. The color

of the fabrics was investigated in terms of color strength (K/S) and fastness properties against light, washing, rubbing, and perspiration. The color and fastness properties obtained from the dyed organic cotton fabrics were between good to excellent.(Korkmaz, N Ebru, 05 Mar 2012)

Natural dyes are derived from plants, invertebrates, or minerals. The majority of natural dyes are vegetable dyes from plant sources-roots, berries, bark, leaves, and wood—and other organic sources such as fungi and lichens. Natural dyes are mostly used to dye natural fibers like cotton, wool, silk, jute etc. But very little information is available on dyeing of synthetic filament like polyester, acrylic, nylon etc. This paper is a comprehensive review of application of natural dyes on synthetic fabrics.

The dyeing of synthetic fabrics with natural dyes requires pre-treatments to generate hydrophilic groups. This paper highlights about the various pre treatment processes used to carry out dyeing with natural dyes on synthetic fabrics. The paper also reviewed the properties of dyed synthetic fabrics.

Properties of Cotton

These dyes are economical dyes and are generally used to produce dark shades such as dark greens, dark blues and blacks.These dyes have good leveling and color fastness properties. The interaction between fiber and dye is established through very strong ionic bonds, which are formed between the anionic groups of the colorant and ammonium cations on the fiber. Chromium or the metal ion acts as bridge between the dye and fiber, which gives rise to a very strong linkage, resulting into excellent fastness properties.(Golam Mawla).

Advantages of Dyes

While common textile dyeing processes are responsible for a large amount of residues in the wastewater from textile finishing companies, dyeing with natural dyes becomes more popular in the last time. In this way, not only water can be saved and water pollution avoided, but a broad spectrum of colors can be reached, opening new possibilities for textile designers. On the other hand, natural dyes are usually less intense and more prone to bleaching due to mechanical impact, washing or UV irradiation. Here we give an overview of different combinations of natural dyes used for dyeing diverse textile materials with and without pretreatment of the textile fabric. The resulting fabrics show a broad range of colors, depending mostly on the textile material and in some cases also on the pretreatment. While washing and UV ~ 150 ~

International Journal of Home Science treatment show a relatively small influence, Martindale abrasion tests changed some of the colors significantly. (Anastasia Fröse. et. al, 2019) [1] .

Experimental evidence for allergic and toxic effects of some synthetic dyes is available. Natural dyes are mostly non-toxic, non-allergic. Some of the natural colours have added value for its medicinal effects on skin and are more than skin friendly. Natural dyestuff can produce a wide range ofcolours by mix and match system. A small variation in the dyeing technique or the use of different mordants with the same dye (polygenetic type natural dye) can shift colours to a wide range or create totally new colours, which are not easily obtainable with synthetic dyestuffs. Unlike non-renewable basic raw materials for synthetic dyes, the natural dyes are usually renewable, being agro- renewable/vegetable based and at the same time biodegradable. Many plants thrive on wastelands.

Thus, wasteland utilization is an added merit of the natural dyes. In some cases the waste in the process becomes an ideal fertilizer for use in agricultural fields. This is a labour intensive

industry, thereby providing job opportunities for all those engaged in cultivation, extraction and application of these dyes on textile. Natural dyes generate sustainable employment and income for the weaker section of population in rural and sub-urban areas both for dyeing as well as for non-food crop farming to produce plants for the natural dyes. Application of natural dyes has potential to earn carbon credit by reducing consumption of fossil fuel (petroleum) based synthetic dyes. The shades produced by natural dyes are usually soft, lustrous and soothing to the human eye. Natural dyes are suitable for protecting and preserving the ancient and traditional dyeing technology and for studying the ancient dyeing methods, colored museum textiles and other textiles recovered by archaeology for conservation and restoration of heritage of old textiles(Rashmi Srivastava and Neetu Singh)

Usually biodegradable and renewable also Non-toxic, non-allergic and non-carcinogenic as these are obtained from animals or vegetable matters without any chemical processing Easy to extract andpurify No disposal problems with natural dye waste Colours produced by natural dyes are usually soft, lustrous and soothing to the eyes(Smita Bhuyan and Ava Rani Phukan)

First, the colors produced by natural dyes and pigments are vibrant. Next, they are not only biodegradable but nontoxic and nonallergic too. This means that they are much better for the environment and for use around humans. It is easy to extract the natural color from plants, fruits, or flowers. Many natural dyes also have antimicrobial properties, making them safer for kids in particular.

Additionally, natural dyes neither contain harmful chemicals nor carcinogenic components, common to artificial or synthetic dyes. By using natural dyes over these other choices, you are helping preserve the environment and lowering human dependence on harmful products. When toxic runoff and residuals from the textile manufacturing and dyeing process often end up in our delicate oceans, we should do all we can to ensure we are using the nontoxic alternative, natural dyes.(May 6, 2019 by Uma Campbell)

Limitations of Dyes

Tedious extraction ofcolouring component from the raw material, low colour value and long dyeing time push the cost of dyeing with natural dyes considerably higher than with synthetic dyes. In case ofsappan wood, prolonged exposure to air converts the colourantbrasiline to brasilein, causing a colour change from red to brown. To overcome this drawback we used a sonicator, and found that the dye extraction was much faster. Some of the natural dyes are fugitive and need a mordant for the enhancement of their fastness properties. Some of the metallic mordants are hazardous.(Padma S Vankar)

At the time and for the almost 250 years which followed, it would have been impossible to imagine that England, at that time a minor footnote in the world of cotton, would have ousted India from its ruling position for centuries and taken the centre stage in the manufacturing and trade of cotton

textiles. Following the Industrial Revolution from the 1780s onwards, British cotton goods rapidly replaced Indian ones in world markets. Simultaneously, India was recast into the largest market for British-manufactured yarn and cloth, and the worldwide cotton industry was turned on its head.(Sven Beckert)

Animal skins and hides, and barks of some tree species were probably the earliest materials used by pre-historic human beings to cover their bodies. The earliest known woven fabrics were those used as shrouds for the Egyptian mummies. These shrouds are considered to be

made around 5500 BC although some authorities claim these were older (12000-10000 BC) and made of linen. It has to be recognized that cellulosic fibers in general and cotton (Gossypium spp.) in particular are easily degraded by microorganisms and are not normally found in a preserved condition in archaeological excavations. Nevertheless, there is enough scientific evidence to trace that cotton has been used in India for over 5000 year(santhanam)

History of Cotton

Farmers in the Indus valley were the first to spin and weave cotton. In 1929 archaeologists recovered fragments of cotton textiles at Mohenjo-Daro, in what is now Pakistan, dating to between 3250 and 2750 BCE. Cottonseeds founds at nearby Mehrgarh have been dated to 5000 BCE.7 Dec 2015

Cotton cultivation dates back 7,000 years, originating in the Indus Valley and Mexico. It spread along ancient trade routes to Europe and Asia before Columbus's voyages introduced it to the Americas, where its cultivation became a major economic force, tragically tied to enslaved labor in the American South. The Industrial Revolution transformed cotton with inventions like the spinning jenny and the cotton gin, dramatically increasing production and making cotton fabrics widely accessible

Types of Cotton

In the fabrics and crafts industry, cotton is an all-round favourite which is available in various textures and thickness. Its high tensile strength makes it strong, durable and less likely to rip or tear. It washes and dries easily and may be washed repeatedly as needed. But with so many different types of cotton fabric to choose from, it can be difficult making a final decision. So, to help you, the team atFabrics Galore have put this guide together on the different types of cotton fabric.

Cotton lawn;Cotton lawn fabric is a thin, relatively sheer, high thread count cotton fabric which is made by using a tight weave, but with a finer thread. This is what creates the buttery smooth surface texture it is well-known for, making it perfect for clothes, blouses, skirts and other clothing pieces forthe warmer months. So, if you are looking to sew a lightweight maxi dress, or a gorgeous summer blouse,cotton lawn may seem like a rather obvious choice for your dressmaking project.

Cotton jersey fabric;Known for its stretchiness and softness, cotton jersey fabric is a staple to make your favorite cotton tee-shirts. It’s a very low maintenance fabric which is incredibly soft and is made up of predominantly cotton with some elastane. One of the huge benefits ofusingjersey fabric is its versatility as it can be worked into most dressmaking projects - from breathable summer tops to base layers for the winter months - it can be used for almost anything.

Cotton poplin:This plain-weave cotton fabric is a light weight fabric which can be used to make a variety of clothing items that you can wear all year. It is often used in men’s shirts as it is soft and light weight and relatively crease free. It is also used in women’s dressmaking as well as sportswear and raincoats - so its popularity is hardly surprising. Cotton poplin is known for its distinctive ribbed texture and tightly closed weave, which makes it very lightweight but still retains its strength. Poplin has always been a staple fabric for its versatility, as it is a comfortable but stylish fabric for all manner of casual and formal wear.

Chambray :With a softer and thinner texture than denim, woven with a coloured yarn in the warp and a white yarn in the weft, chambray is a widely used fabric for all kinds of clothing. It

is available in different colours, but is often light blue in colour, which is where it gets its similarity to denim. This makes it perfect for the summer months, as you can still get the look of denim in your clothing - from men's and women's shirting to lightweight dresses - but without being weighed down. Stylish, flattering, and quick to sew, chambray is the perfect material for any summer dressmaking project.

Brushed cotton:Brushed cotton is a combination of various fabric structures, creating a soft and smooth finish which is extremely comfortable on the skin without any itchiness. This fabric's breathability helps to reduce sweat and is perfect for a variety of dressmaking, patchworking and quilting projects. It is a popular fabric choice for making kids' winter pyjamas. Due to its exceptional insulation capabilities, brushed cotton is ideal to wear during changeable weather conditions throughout autumn, or just before the sun comes out in spring. It provides protection against wind chill, but it doesn't make you feel overheated.Cottondrill:his durable fabric is known for being a very dense, strong, medium to heavy weight fabric which is a popular choice for uniforms and work clothes. It's very similar to the texture and diagonal weave of denim, but is usually dyed and has a smoother appearance, making it perfect for all sorts of garments - including tailored and casual designs. It is easy and comfortable to wear, and its use has become progressively more stylish and contemporary.Seersuckerfabric:If you are looking for a lightweight cotton fabric that never needs ironing, seersucker cotton is the perfect choice for you. It originated in India and is commonly used to make shirts, shorts and even suits best suited for warmweather, being both light, breathable and durable. As the uneven slightly puckered texture causes the fabric to sit away from the skin, it allows for air circulation, making it ideal for the warmer months - as well as activewear. Check out the Fabrics Galore range ofclassicgingham seersucker fabrics.

3.Methodology

Research Approach

In this study, we tried to develop a simple method of natural dyeing by using mint leaves and lemon extract. Instead of choosing normal fabric, we used underarm pads as a base material because they are absorbent and easy to handle. The work was carried out in small stages—preparation, dyeing, and testing.

Materials Needed

- Fresh mint leaves
- Fresh lemons
- Underarm pads (cotton-based)
- Water (distilled/clean)
- Alum (as a natural fixer)
- Salt (to improve absorption)

Instruments used

Stainless steel container, muslin cloth, grinder, thermometer, measuring jar, and drying rack.

Preparation of Extracts

Mint Extract

- Mint leaves were washed and shade-dried slightly.
- Leaves were crushed using a grinder.
- Boiled in water (1:10 ratio) for about 30 minutes at medium heat.
- Filtered the solution and kept it in a glass container.

Lemon Extract

- Lemons were cut and juice extracted.
- The juice was filtered to remove seeds and pulp.

- Stored in a cool place until dyeing.

Pre-treatment of Pads

- Pads were rinsed with warm water to remove surface chemicals.
- Soaked in mild detergent, then washed properly.
- For better dye holding, pads were soaked in 5% alum solution for 30 minutes.
- Dried under shade before dyeing.
- Dyeing Procedure

Mint Leaf Dye

- The underarm pads were immersed in mint extract solution.
- Heated at around 70–80°C for 40–50 minutes.
- Pads were then rinsed and dried.

Lemon Extract Dye

- Pads were soaked in lemon juice directly (room temperature).
- Kept for 24 hours to allow full absorption.
- Then washed lightly and dried.

Mixed Dye (Mint + Lemon)

- Mint extract and lemon juice were mixed in equal parts.
- Pads were soaked in this mixture at 60°C for 45 minutes.
- Dried under natural shade.

Fixing (Mordanting)

- Two methods were used:
- Before dyeing – Pads were treated with alum solution.
- After dyeing – Dyed pads were dipped in vinegar water (10%) for 10 minutes to make color stronger.

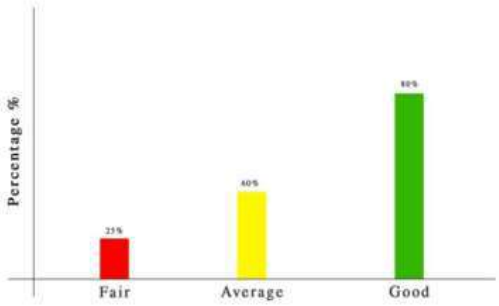
Evaluation of Dyed Pads

- Visual Check: Shade, brightness, and uniformity were noted.
- Wash Test: Pads were washed with soap water to see if color faded.
- Rub Test: Pads were rubbed on white cloth to check if color came off.
- pH Sensitivity: Pads were tested in acidic and alkaline solutions.
- Durability: Samples were kept for several days to see stability.

Limitations in Our Work

- Mint leaves and lemons give light shades, not very dark colors.
- The shades may vary because natural plants change with season.
- Longer exposure to lemon (acidic) may weaken pads.

Eco-friendly Aspect



- No harmful chemicals were used.
- Waste material was biodegradable.
- The method is safe and sustainable.

CONCLUSION

From this study, we understood that mint leaves and lemon extract can be used as natural dyeing agents for underarm pads. The shades obtained were light but fresh-looking, with mint giving a soft greenish tint and lemon producing a mild yellow shade. When both were mixed, the pads showed slightly different tones that looked more attractive. The use of alum and vinegar as natural mordants helped in improving the shade and fixing the color. Though the dye was not as strong as synthetic dyes, it stayed stable for a few washes and did not cause any harmful effects to the fabric. This method proved to be eco- friendly, safe, and simple, as we did not use any harmful chemicals. The materials (mint and lemon) are easily available and

low-cost, making the process sustainable. However, we also noticed some limitations like lighter shades, variation in color due to season, and less durability compared to chemical dyes. Still, this study shows that natural extracts can be used for small household or creative dyeing purposes. Overall, the project gave us a new idea of how simple plants like mint and lemon can be used in our way for dyeing, and it encourages more research on improving natural dye shades and fastness.

RESULT & DISCUSSION

TEXTILES FOR SOUND MANAGEMENT : FROM TRADITIONAL ABSORBERS TO SMART ACOUSTIC SOLUTION

B. Shakthi,**A. Jasira Banu**
Assistant Professor, PSGR Krishnammal College for Women

Abstract

The rapid growth of urbanization and technological advancement has brought new challenges in managing sound and noise pollution. Traditional construction materials, though effective in strength and durability, often fail to provide sufficient acoustic comfort. In this context, acoustic textiles have emerged as a modern solution that combines aesthetics, sustainability, and functionality. This paper explores the role of acoustic textiles in the modern era, examining their materials, technologies, applications, and future scope. By bridging science and design, acoustic textiles are becoming key players in creating healthier and more sustainable living and working environments.

Keywords: Acoustics, Textiles, Noise control, Fibers, Non-woven, technology, sustainability

INTRODUCTION

The term Acoustics is derived from the Greek word akoustos, which means “heard”. It is the science that studies the production, control, transmission, reception, and the effects of sound. Sound plays a crucial role in shaping human experiences. While pleasant sounds can create comfort and productivity, unwanted noise contributes to stress, health problems, and reduced efficiency. In the modern era, where population density, transportation, and industrial activities are at their peak, noise pollution has become a pressing concern (Wintzel, 2014). The World Health Organization (WHO) defines noise pollution as a worldwide problem influencing the health of numerous individuals. Acoustic textiles, designed to absorb, insulate, or diffuse sound, provide innovative solutions for these challenges. Beyond functionality, these textiles also enhance the aesthetic and sustainable aspects of interior and architectural design. Textiles are used for sound absorption, sound insulation, and creating acoustically balanced environments by converting sound energy into heat through friction within their porous structures. Research focuses on how fiber types, fabric structure, and density affect acoustic performance, as well as the use of innovative and recycled materials.

Noise Control

The majority of noise issues are typically impossible to address at the source, therefore noise isolation technologies are primarily used to reduce noise emissions. There are two approaches to noise control: active and passive. Active noise control uses a secondary audio resource to reduce noise completely whereas passive noise control is supplied by sound absorbers and sound-insulating materials (Nilsson, 2019). Good thermal and sound insulation characteristics are the basic requirements of insulating materials. The primary features of the most common insulating materials are their noise reduction coefficient of 0.5–0.9 and their thermal conductivity coefficient of 0.030–0.045 W/mK (Singh & Sharma, 2021).

Mechanism of Sound Absorption

Sound absorption is a well-known and commonly used solution for noise control. It is an energy conversion process (Vigé, 2010). The kinetic energy of the sound is converted to heat energy when the sound strikes the cells offibers. The most common sound absorption materials are open cell foam and fiber. There are three primary physical phenomena involved in sound absorption. The first is frictional loss, which occurs when sound waves cause oscillation of air particles. As these air molecules move through the pores or fibersof the absorbing material,

friction is generated, leading to energy loss and a slight increase in the temperature of both air and material. The second mechanism involves heat exchange. Sound waves create pressure fluctuations in the air; in open space this is an adiabatic process, but when absorbing materials with a large surface-to-volume ratio are present, heat is exchanged between the air and the material. This shifts the process toward an isothermal transformation, resulting in energy loss. Such effects are more significant at low frequencies, since longer cycles allow greater heat transfer, while at higher frequencies the effect is negligible. The third mechanism relates to internal material losses caused by forced mechanical oscillations under acoustic pressure. This effect is most evident in closed-cell porous materials, while in fibrous and open-cell porous structures it is so minimal that it is usually disregarded (Li and Ren, 2011).

Textiles in Acoustics

Textiles have been used for centuries to soften sound and reduce echoes, with heavy fabrics such as curtains, rugs, and carpets commonly found in palaces, theatres, and homes even before scientific validation. The formal recognition of textiles as sound-absorbing materials began in the early 20th century through the pioneering work of Wallace Clement Sabine, who is considered the father of architectural acoustics (Cox & D'Antonio, 2016). During this period, wool felt, velvet draperies, and upholstered seats were increasingly adopted in concert halls and lecture spaces to improve sound clarity. The mid-20th century marked a turning point with the rise of cinemas, automobiles, and airplanes, where noise control became essential and nonwoven textiles—developed in the 1940s and 1950s—were integrated into acoustic insulation panels, carpets, and vehicle interiors (Datta et al., 2021). In the modern era, advancements in synthetic fibers, composite structures, and smart technologies have transformed textiles into highly engineered acoustic materials that not only absorb and insulate sound but also contribute to sustainability and aesthetic design in architectural, industrial, and lifestyle applications (Pieren et al., 2016; Asdrubali et al., 2012).

Textiles play a crucial role in managing and controlling sound due to their fibrous, porous, and flexible structures, which allow them to absorb, reflect, or transmit sound energy. When carefully engineered in terms offiber type, fabric structure, and thickness, textiles can significantly improve acoustic comfort across various environments. Heavy curtains and draperies, wall and ceiling panels, carpets, and upholstered furniture are widely used for sound absorption, reducing echo and background noise in spaces such as theatres, cinemas, and homes. Beyond absorption, textiles also serve as effective noise insulators when combined with materials like foams, composites, or membranes, making them essential in automotive and aerospace industries for reducing engine and traffic noise in cabins. Certain textile surfaces are further designed to diffuse sound, enhancing clarity and distribution in concert halls, classrooms, and studios. With recent advances in technology, smart acoustic textiles incorporating nanofibers, coatings, and sensors are being developed to adapt to changing sound environments, with potential for intelligent regulation of acoustics. Additionally, the use of natural fibers such as wool, jute, hemp, and cotton, along with recycled fibers like PET, makes acoustic textiles a sustainable solution, while their availability in diverse textures, colors, and designs ensures they also contribute to aesthetic appeal.

In recent times nonwoven textiles are used widely for sound insulation and absorption applications such as sound reflectors, sound diffusers, sound absorbers, and sound barriers due to their porous structure. The loss of sound energy in textile materials is influenced by several physical factors, including fiber type, fiber diameter, material thickness, density, bonding method, air resistance, and porosity. In this context, nonwoven surfaces, with their flexible

fiber skeleton and large internal surface area, naturally provide the required physical conditions for effective sound absorption.

Materials and Technology of Acoustic Textiles

The effectiveness of acoustic textiles largely depends on the choice of materials and the technologies applied during their production. Since sound absorption is influenced by physical properties such as porosity, density, thickness, and fiber arrangement, textiles are carefully engineered to maximize these characteristics for better performance (Nilsson, 2019).

Materials: Both natural and synthetic fibers are used in acoustic applications, each offering unique advantages. Natural fibers such as wool, jute, hemp, cotton, and coir are inherently porous, biodegradable, and sustainable, making them effective and eco-friendly sound absorbers. Wool, for example, is valued not only for its excellent sound absorption across a wide frequency range but also for its flame resistance and durability (Asdrubali et al., 2012). Jute and hemp, with their coarse fibrous structures, are increasingly used in wall panels and insulation composites for sustainable building applications (Datta et al., 2021). On the other hand, synthetic fibers such as polyester, nylon, and polypropylene provide consistency, durability, and flexibility in design. These fibers can be engineered into nonwoven structures or composites that enhance absorption while maintaining lightweight and cost-effective properties (Shrivastava, 2018). In addition, hybrid materials blending natural and synthetic fibers are often developed to balance sustainability with high acoustic performance.

Technology: The production of acoustic textiles has advanced significantly with innovations in textile engineering. Nonwoven technology is one of the most widely used methods, as it produces fabrics with high porosity, interconnected fiber networks, and large internal surface areas that efficiently dissipate sound energy (Pieren et al., 2016). Needle-punched nonwovens, thermal bonding, and chemical bonding techniques are commonly applied to tailor materials for specific acoustic needs. Three-dimensional weaving and knitting methods are also employed to create fabrics with layered or structured geometries, enhancing their ability to trap and dissipate sound waves (Vigé, 2010). Emerging technologies such as **electrospinning** enable the production of nanofibers with extremely fine diameters, resulting in materials with high surface-to-volume ratios that are particularly effective at absorbing high-frequency sounds (Pieren et al., 2016). Additionally, micro-perforation and lamination techniques are used to improve sound absorption while maintaining aesthetic appeal and durability. Modern research is also moving toward smart acoustic textiles, which integrate functional coatings, phase change materials, or embedded sensors. These advanced textiles can adapt their acoustic behavior to environmental changes or provide real-time monitoring of sound levels. Such innovations not only expand their applications in architecture, automotive, and aerospace industries but also align with global demands for sustainable and intelligent material solutions (Singh & Sharma, 2021).

Applications of Textiles in Acoustics

Acoustic textiles are finding wide applications across different sectors:

Architecture and Interior Design

In architecture and interior spaces, textiles play a significant role in enhancing acoustic comfort by reducing noise and improving sound quality. Heavy or multilayered curtains made of wool, velvet, or specially engineered fabrics are widely used in auditoriums, theatres, and conference halls to absorb mid-to-high frequency sounds and minimize echoes. Similarly, acoustic wall panels and ceiling baffles covered with nonwoven or woven textiles improve speech clarity in offices, classrooms, and restaurants. Textile-based carpets and rugs further contribute by dampening footstep noise and lowering overall reverberation in homes, hotels, and libraries. Additionally, sofas, chairs, and partitions upholstered with acoustic fabrics provide functional noise control while also adding aesthetic value to open spaces. Overall, the integration of textiles in interior design offers a balanced solution of noise comfort, improved intelligibility,

and enhanced visual appeal in both public and private buildings. Acoustic textiles have become increasingly important in modern workplaces, especially open-plan offices where speech privacy and concentration are often compromised by noise. Textile-covered acoustic partitions and screens are used to divide spaces, limit distractions, and ensure confidentiality in conversations. Ceiling panels and modular acoustic tiles finished with fabrics not only improve sound absorption but also provide design flexibility. Furthermore, textile-wrapped soundproof furniture, such as pods and booths, creates private work zones within noisy environments. By controlling noise and enhancing speech clarity, acoustic textiles contribute to productivity, employee well-being, and overall workplace efficiency.

Transportation

In the transportation sector, acoustic textiles are essential for improving passenger comfort by reducing noise levels inside vehicles, aircraft, and trains. In the automotive industry, nonwoven and multilayer composites are widely used in headliners, carpets, seat covers, and door trims to insulate against road, engine, and vibration noise. Similarly, in the aerospace industry, lightweight textile composites line cabin walls, floors, and seats to reduce engine and airflow noise without adding significant weight, thereby ensuring both comfort and fuel efficiency. In trains and ships, textile-based flooring, partitions, and ceiling linings minimize structure-borne vibrations and unwanted sound transmission, creating quieter and more pleasant travel experiences.

Healthcare and Educational Spaces

In healthcare and educational environments, acoustic textiles support healing, comfort, and communication by reducing disruptive noise. In hospitals and clinics, sound-absorbing curtains, wall panels, and acoustic screens help create calmer spaces that minimize stress for patients and staff. Therapy and counseling rooms often use acoustic fabrics to ensure confidentiality and improve the focus of sessions. Similarly, in classrooms, lecture halls, and libraries, textile-based curtains, wall coverings, and ceiling baffles reduce reverberation and enhance speech clarity, enabling better comprehension for students and teachers. Thus, textiles in these settings play a vital role in promoting learning, concentration, and recovery.

Fashion and Lifestyle

Beyond functional and industrial uses, acoustic textiles are finding applications in fashion and lifestyle domains. In homes, curtains, rugs, cushions, and wall hangings made from acoustic fabrics provide noise reduction while blending seamlessly with interior décor. Designers are also experimenting with wearable acoustic textiles that can absorb or modulate sound, particularly for protective clothing in noisy work environments. Decorative textile elements, such as acoustic room dividers and designer wall panels, further demonstrate how textiles can combine artistic appeal with sound management. By integrating both style and function, acoustic textiles in lifestyle applications offer a balance of comfort, design, and innovation.

Industrial Applications

Acoustic textiles are widely employed in industrial and commercial environments to ensure worker safety and compliance with noise regulations. Factories, workshops, and manufacturing units use acoustic curtains, barriers, and panels to control machine noise and reduce exposure levels, thereby protecting workers' hearing. Recording studios, broadcasting centers, and concert halls rely on textile wall coverings, ceiling clouds, and panels to enhance sound diffusion and clarity. In large-scale event spaces and auditoriums, specially engineered acoustic fabrics are installed to manage reverberation and maintain sound quality for audiences. These applications highlight the crucial role of textiles in controlling noise across demanding industrial and performance settings.

Role of Sustainable Textiles in Acoustics

Sustainability in acoustic textiles has gained prominence as industries and researchers increasingly seek eco-friendly alternatives to conventional sound-absorbing materials. Traditionally, synthetic fibers such as polyester and polypropylene have dominated acoustic applications due to their durability, consistency, and ease of processing; however, their non-biodegradable nature poses significant environmental challenges. As a result, natural fibers such as wool, jute, hemp, coir, and cotton are being widely explored as sustainable alternatives. These fibers are inherently porous, renewable, and biodegradable, making them effective in absorbing sound across different frequency ranges while reducing environmental impact (Sekar et al., 2019). For example, wool exhibits excellent acoustic absorption, thermal resistance, and fire safety properties, while coir and jute are increasingly used in insulation panels for buildings due to their coarse fibrous structures and sustainability.

In addition to natural fibers, recycled textiles and waste-derived fibers are also being developed into acoustic products. Recycled PET (derived from plastic bottles) is processed into nonwoven fabrics for panels, carpets, and wall coverings, offering comparable acoustic performance to virgin synthetic fibers while minimizing plastic waste (Mohammadi et al., 2024). Industrial textile waste, such as cotton and denim scraps, is repurposed into composite acoustic panels, aligning with circular economy principles. Hybrid materials that blend natural fibers with recycled synthetics are further designed to balance acoustic efficiency, durability, and eco-friendliness.

From a technological perspective, sustainable acoustic textiles are produced using low-energy, chemical-free processes such as needle-punching and thermal bonding, which minimize environmental impact compared to traditional chemical treatments. Recent innovations also integrate bio-based binders and coatings instead of petroleum-derived resins, improving both biodegradability and indoor air quality. Moreover, sustainable acoustic textiles often serve a dual rolebyproviding

not only noise control but also aesthetic enhancement, making them valuable in green architecture, interiors, and automotive design where eco-certifications such as LEED (Leadership in Energy and Environmental Design) are increasingly prioritized.

Overall, the adoption of sustainable textiles in acoustics reflects a shift toward environmentally responsible design, where functionality, comfort, and ecological balance are equally valued. With growing awareness of climate change and waste management challenges, the future of acoustic textiles lies in harnessing renewable fibers, recycling post-consumer materials, and innovating biodegradable composites that contribute to both sound comfort and sustainable living (Taban et al, 2020)

Future Prospects of Textiles in Acoustics

The future of acoustic textiles lies in their ability to integrate functionality, sustainability, and smarttechnologyto meet the evolving demands of modern society. With rapid urbanization, population growth, and increasing exposure to noise pollution, the need for advanced sound management solutions is greater than ever. Acoustic textiles are expected to play a key role in this transformation by moving beyond traditional applications toward intelligent, eco-friendly, and multifunctional systems. One of the most promising directions is the development of smart acoustic textiles**.** By embedding nanofibers, sensors, or responsive coatings, fabrics can be engineered to adapt their sound absorption properties dynamically depending on the acoustic environment. Such "intelligent soundscapes" may be integrated into offices, homes, and public spaces, allowing real-time regulation of noise levels for comfort, privacy, or performance optimization. With the support of IoT (Internet of Things) and AI technologies**,** future textiles could monitor acoustic conditions and automatically adjust their absorption or insulation

capacity. Sustainability will remain another major focus. Increasing research is directed toward bio-based and recycled fibers, biodegradable composites, and low-impact manufacturing technologies to align acoustic textiles with global goals of carbon neutrality and circular economy. Future products may rely heavily on natural fibers such as wool, hemp, and jute, blended with recycled synthetics, to provide high-performance noise control while reducing environmental impact. Another prospect lies inmultifunctional textiles that combine acoustic properties with other performance features. For example, textiles with integrated phase change materials (PCMs) could simultaneously regulate both thermal and acoustic comfort. Fire-resistant, antibacterial, or air-purifying acoustic textiles are also being explored to create safer and healthier interior environments. Finally, as design and lifestyle trends evolve, acoustic textiles are expected to gain prominence as aesthetic elements that blend form and function. Innovations in printing, weaving, and surface finishing will allow them to serve not only as sound regulators but also as customizable decorative features in architecture, fashion, and home design. These advancements will position textiles as indispensable tools for managing noise in a world that increasingly values health, sustainability, and comfort.

The modern era demands solutions that are not only functional but also sustainable. Acoustic textiles meet this need by utilizing recycled fibers, biodegradable materials, and energy-efficient manufacturing processes. For instance, wool-based acoustic panels provide natural flame resistance, while recycled polyester fabrics reduce environmental footprint. Their human-centric design fosters comfort, well-being, and productivity, aligning with global movements toward greener and healthier living spaces. Despite their benefits, acoustic textiles face challenges such as higher production costs, lack of awareness among end users, and limited standardized testing methods. However, research is advancing rapidly, with innovations in smart acoustic textiles that can adapt to changing sound environments. Integration with IoT and AI-driven monitoring systems may pave the way for “intelligent soundscapes,” revolutionizing the way we experience spaces.

Conclusion

Acoustic textiles have emerged as a vital solution for addressing the challenges of noise pollution and enhancing acoustic comfort in modern living and working environments. Their unique fibrous and porous structures allow them to absorb, insulate, and diffuse sound, making them indispensable in architecture, transportation, workplaces, healthcare, and even lifestyle applications. By combining functionality with aesthetics, acoustic textiles not only improve speech intelligibility and reduce noise but also contribute to interior design and overall well-being. With the growing emphasis on sustainability, the use of natural and recycled fibers is expanding, aligning acoustic materials with global environmental goals. Looking ahead, advancements in smart technologies, nanofiber engineering, and multifunctional designs will further enhance their adaptability and effectiveness, enabling textiles to play a central role in creating healthier, quieter, and more sustainable environments. In essence, acoustic textiles represent the intersection of science, technology, and design, offering innovative solutions to the acoustic challenges of the modern era.

Abstract

The pet care industry is increasingly shifting toward sustainable and eco-friendly products. Conventional disposable pet diapers, primarily composed of synthetic fibers and superabsorbent polymers, create environmental hazards and may cause skin irritations in pets. This study explores the development of a sustainable pet diaper using bamboo fibre, chosen for its high absorbency, antibacterial properties, and biodegradability. Thefabric was dyed and finished with herbal extracts of aloe vera, neem, and fenugreek to impart additional antimicrobial, soothing, and antifungal properties. Experimental evaluation included absorbency rate, retention capacity, air permeability, and microbial resistance. The results indicated that the bamboo-based diaper demonstrated superior absorbency and comfort while the herbal dyeing imparted durable functional finishes. This innovation has the potential to reduce the ecological footprint of pet diapers and promote sustainable pet care solutions.

Keywords Bamboo fibre, sustainable pet diaper, herbal dyeing, aloe vera, neem, fenugreek, absorbency, antimicrobial

INTRODUCTION

In the growing movement towards sustainable and pet-friendly product , the development of reusabledogdiaperpadsusingnaturalfibersandherbalfinishesisgainingsignificantattention this project focuses on designing and stitching a natual , reusable dog diaper pad using bamboo fiber asthe primary fabrick, enhanced with herbal finishing agentslike aloevera,neem, and fenugreek for added skin protection,hygiene,and comfort. bamboo fiber is known for its exceptional quality-soft texture, high absorbency, antibacterial properties, biodegradability .these feature make it an ideal material for dog diaperpads,especially for dogs with sensitive skin or prone to allergies.The use of bamboo terry clothas the core absorbent layer ensures that moisture is effectively absorbed and wicked away from the dog's body, keeping the pet dry and comfortable during use. what makes this diaper pad unique is not just theuse of bamboo fiber but also the naturalherbal finishing applied to the final product .aloevera is well-known for its soothing, moisturizing ,and anti-inflammatoryeffects on the skin. neem,a powerfulnatualantibacterial and anti fungalagent ,helps preventinfections and maintains skin health. fenugreek adds cooling ,healing, and anti- itch properties, making the diaper pad ideal for long -term wear with out causing irritation,rashes or discomfort. The stitching process involves selecting soft, breathable layers of naturalfabrics, including bamboo terryforabsorbency,orgnic herbal-finished outer cloth for added protection. everystep- from fabric selectionto finishing- is designed with care to creat a product that is not only environmentlly responsible but also safe, reusable,and gentle for dogs.

Traditional herbal knowledge and modern sustainable design, offering a natural solution to everyday pet care needs. by choosing biodegradablefabrics and natural herbal treatments, we

move lifestyle for pets protecting the environment from the harmful impact of disposable synthetic product.

In the modern era of sustainable living,pet care is no longer limited to just comfortable and convenience-it is also about adopting eco- friendlypractices that reduce waste and promate natural well-being . among these innovations ,reusable dog diaper padmade from bamboo fiber combined with (herbal finish)methods stand out as a unique and responsible solution. this project is dedicated to the design , stitching and finishing of a natural dog diaper pad

The choice of bamboo fiber as the main fabric is basedon its remarkable properties .bamboo is a (renewble)and (biodegradble) resourse with asoft ,(breathable) ,and (highly absorbent) structure,making it extremelysuitable,for products indirectcontect with skin .fordogs,bamboofabric provides a gentle and (hypoallergenic) surface reducing the chances of rashes itching ,or discomfort that are often associated with synthetic disposable diapers.moreover ,bamboonaturaly resists bacterial growth and offers excellent moisture

This project does not step with eco-friendly fabric selection the finished productis further enhanced with natural herbal finishing treatments that elevateits health benfits it reflects the importance ofsustinable product design in every day life
The dog diaper pad stitched from bamboo fiber with aloe vera neem ,and vendhyam finishing represents a sustainablity ,tradsion and innovation .integrating herbal finishing make this disaper pad not only practical but therapeutic , offering natural protection and comfortable for dogs with sensitive skin.

REVIEW OF LITERATURE

2.1 Natural FriendlyFabrics

Eco-friendly Textiles for Pet Care – Pet care products like dog diapers require sustainable, biodegradable, and skin-safe textiles to reduce environmental impact and improve animal well-being bamboo Fiber and Cotton Properties – Bamboo fiber offers high absorbency, softness, and natural antibacterial properties, while cotton provides durability, comfort, and breathability, making both suitable for pet diapers.

2.1.1 Absorbent&Comfort PropertiesofFabrics

Bamboo Fiber Absorbency & Softness – Bamboo absorbs moisture quickly, keeping the pet's skin dry and reducing irritation. Its natural antimicrobial effect helps control odor.

Cotton Fabric Comfort and Durability – Cotton ensures skin-friendliness, easy washability, and long-term use, but requires functional finishing to improve hygiene properties for pet applications.

2.2 HerbalFinishingin Textiles

Importance of Natural Antimicrobial Finishes–Herbal finishes provide antibacterial and antifungal resistance without harmful chemicals, making textiles safer for sensitive pet skin. Role of Herbal Extracts in Skin Protection–Plant-basedextracts like neem,aloevera,and fenugreek protect against rashes, irritation, and infections while maintaining natural comfort.

2.3 NeemFinishingon Fabrics

Antibacterial Properties of Neem – Neem contains bioactive compounds (nimbin, azadirachtin) with proven antibacterial, antifungal, and insect-repellent effects. SkinProtection&OdorControlthroughNeemExtracts–Neem-finishedfabricsprevent microbial growth, reduce odor, and enhance hygiene in dog diapers.

2.3.1 AloeVeraFinishingonFabrics

Moisturizing&CoolingEffectofAloeVeraonSkin–Aloeverafinishesmaintainskinhydration, soothe irritation, and provide a cooling sensation for pets wearing diapers. Aloe Vera in Textile

Functional Finishes – Aloe vera enhances comfort, reduces inflammation, and helps protect sensitive skin during long wear.

2.4 Fenugreek(Vendhyam)Finishingon Fabrics

AntifungalandarAnti-inflammatoryPropertiesofFenugreek–Fenugreekseedscontain alkaloids and flavonoids that provide antimicrobial, antifungal, and anti-inflammatory effects. Skin Soothing and Rash Prevention Effect–Fabrics treated with fenugreek extract help in soothing pet skin, preventing rashes, and reducing foul odor naturally.

2.4.1 Herbal FinishedFabricsinPetTextiles

ApplicationofHerbalFinishesforPetComfort–Combiningneem,aloevera,andfenugreek extracts in pet diapers ensures comfort, hygiene, and safety for dogs. SustainabilityandEco-friendlyApproachinPetProducts–Herbalfinishedbamboo/cottonfabrics promote non-toxic, biodegradable, and sustainable alternatives to synthetic pet care products.

2.5 AloeVeraFinishingon Fabrics

Aloe vera is a well-known medicinal plant widely applied in the textile industry for its natural healing and skin-friendly properties. Its bioactive compounds, including vitamins, amino acids, and polysaccharides, make it highly effective in providing moisturizing, cooling, and soothing effects. In fabric finishing, aloe vera not only enhances comfort but also adds functional benefits such as anti-inflammatory and antimicrobial activities. These properties make aloe vera-treated fabrics suitable for sensitive applications like pet care products, where prolonged contact with skin demands safety and comfort.

2.5.1 Moisturizing&CoolingEffect of AloeVeraon Skin

One of the most significant advantages of aloe vera finishing is its ability to provide deep moisturization and a cooling effect on the skin. When applied to fabrics, aloe vera forms a protective layer that helps maintain skin hydration, thereby preventing dryness and irritation.Thisisparticularlyusefulindogdiapers,whereprolongedwear canotherwiseleadtodiscomfort or rashes. The soothing property of aloe vera ensures that pets experience comfort even during extended use.

2.5.2 AloeVerainTextileFunctionalFinishes

Aloeverahas been increasinglyused in functional textilefinishingdueto its bioactiveproperties that improve the overall performance of fabrics. Its anti-inflammatory nature helps in reducing skin irritation, while its antimicrobial effect prevents the growth of odor-causingmicroorganisms. Fabrics treated with aloe vera thus become more comfortable, hygienic, and suitable for direct skin contact. In the context of dog diapers, aloe vera finishing contributes to maintaining freshness, enhancing softness, and ensuring long-term skin protection for pets.

3. METHODOLOGY

3. MATERIALSANDMETHODS

For the development of the dog diaper, bamboo terry fabric was selected as the primaryabsorbent material due to its natural softness, and high moisture retention capacity. Cotton fabric was used for the outer protective layer, while a biodegradablewere included to ensure proper fit and adjustability.The herbal finishing agents selected for this study were Aloevera , Neemleaves, and Fenugreek seeds,

3.6.1 Absorbency Test

The diaper was tested for water absorption capacity by pouring a measured amount of liquid on thefabric and recording thetimetaken for completeabsorption. Bamboo fibershowed faster and higher absorbency compared to cotton.

3.6.2 Antimicrobial Test

The herbal-treated fabrics were tested against common bacteria (E. coli, S. aureus) using agar plate method. Fabrics treated with neem and aloe vera showed clear zones of inhibition,

confirming antimicrobial efficiency.

3.6.3 ComfortTest

The softness and skin-friendliness of the diaper were checked by manual touch and stretch properties. Herbal finishing enhanced comfort and reduced odor formation.

3.6.4 Wash Durability Test

The diaper was washed multiple times to check whether the herbal finish and absorbency were retained. Results showed that the properties remained effective for 10–12 washes.

3.6.5 User Feedback

The prototype diaper was tested on selected pet dogs under supervision. Owners reported good absorbency, comfort, and reduced odor. They also found it easy to wash and reuse.

3.7 Data Collection and Analysis

Data was collected from experimental testing, including absorption rate, microbial inhibition zones, and durability results. Comparative analysis was done between untreated fabric and herbal-treated fabric to evaluate the improvement in properties. Observations confirmed that the combination of bamboo fiber and herbal extracts significantly enhanced diaper performance. Herbal finishes gradually reduce after multiple washes Prototype designs may require modifications for very large or very small breeds.

Conclusion

This study adopted a holistic approach integrating natural fibers, herbal treatments, and sustainable design techniques to develop eco-friendly dog diapers. By systematically preparing herbal extracts, applying them to fabrics, constructing a multi-layer absorbent structure, and testing their performance, the study demonstrated that sustainable pet diapers can be effectively created. This approach not only enhances pet comfort and hygiene but also significantly reduces the environmental burden associated with synthetic disposable diapers. The findings emphasize the potential of combining bio-based materials and herbal finishes to create innovative, sustainable pet care products, contributing to a circular and environmentally responsible textile system.

Abstract

Textiles play an essential role in modern life, impacting not only fashion and comfort but also healthcare, industry, and technology. From clothing to home furnishings, protective gear, and even medical applications, textiles are woven into daily routines, providing functionality, aesthetics, and safety. This paper explores the significance of textiles in everyday life, analysing their historical development, technological advancements, and the growing emphasis on sustainable materials. Through literature review and case studies, this study highlights how textiles contribute to human well-being, economic development, and environmental sustainability. The findings emphasize the need for innovation and responsible consumption to meet the demands of a changing world.

Keywords: Textiles, daily life, healthcare, sustainable materials, technology

1. Introduction

Textiles have been an integral part of human civilization for centuries, evolving from simple woven fabrics to high-performance materials used in diverse applications. Today, textiles are not limited to apparel but extend into various aspects of life including healthcare, transportation, architecture, sports, and space exploration. They offer protection, comfort, and aesthetic appeal, shaping cultural identities and lifestyles.

In everyday life, textiles influence how people dress, sleep, work, and interact with their environment. Whether through clothing that provides warmth, bedding that enhances rest, or technical fabrics that ensure safety in hazardous conditions, textiles contribute to well-being and productivity. Moreover, advances in material science have introduced innovative fabrics that are lightweight, breathable, waterproof, and environmentally friendly.

This paper explores the multifaceted roles of textiles, highlighting their significance across sectors and the need for sustainable practices. Through a review of scholarly literature and industry reports, it seeks to understand how textiles have adapted to modern demands while continuing to support human life in practical and meaningful ways.

2. Literature Review

2.1.Historical Evolution of Textiles

The earliest use of textiles can be traced back to prehistoric times, where natural fibers such as flax, cotton, and wool were used to craft basic garments (Rutherford, 2015). Over centuries, textile techniques evolved through weaving, dyeing, and tailoring, reflecting regional traditions and technological advancements.

During the Industrial Revolution, mechanization transformed textile production, leading to mass manufacturing and global trade (Smith, 2017). The invention of synthetic fibers such as nylon and polyester further diversified applications, enabling lighter, stronger, and more resilient fabrics.

2.2. Textiles in Daily Apparel and Comfort

Textiles are primarily associated with clothing, providing insulation, protection from weather, and personal expression. According to Johnson (2019), the choice of fabric impacts not only aesthetics but also health, with natural fibers like cotton and linen being breathable and hypoallergenic compared to synthetic alternatives.

Bedding textiles such as sheets, pillows, and mattresses enhance sleep quality, while upholstered furniture materials provide ergonomic comfort and longevity. The evolution of performance fabrics has improved sportswear, enabling moisture control and thermal regulation (Lee & Park, 2020).

2.3. Textiles in Healthcare

Medical textiles play a critical role in infection control, wound management, and surgical safety. Antimicrobial fabrics, used in hospital curtains and patient gowns, help prevent cross-contamination (Thompson, 2021). Advanced wound dressings made from bioactive fibers promote faster healing, while compression garments support circulatory health.

2.4. Technical and Protective Textiles

Industries such as construction, automotive, and aerospace rely on technical textiles for insulation, fire resistance, and structural reinforcement. Kevlar and carbon-fiber composites are used in protective gear and vehicle interiors, ensuring safety without adding significant weight (Miller, 2018).

2.5. Sustainable and Eco-Friendly Textiles

The environmental impact of textile production has led to innovations in sustainable practices. Materials such as bamboo, hemp, and recycled fibers are being used to reduce water consumption, chemical use, and carbon emissions (Green Textile Council, 2022). Consumers are increasingly adopting eco-friendly products, further encouraging responsible manufacturing.

2.6. Textiles and Technology

Smart textiles integrated with sensors and conductive fibers are revolutionizing health monitoring, athletic training, and communication. Wearable devices embedded in fabrics can track heart rate, body temperature, and movement patterns, opening new avenues for research and development (Garcia et al., 2021).

3. Methodology

This study follows a qualitative research design aimed at exploring the significance of textiles in everyday life. The methodology includes:

3.1 Data Collection

- **Secondary Sources:**Extensive secondary data were gathered from academic journals, industry reports, government publications, and authoritative websites to build a foundational understanding of textile applications, innovations, and challenges. Publications from organizations such as the World Bank, United Nations Environment Programme (UNEP), and industry bodies like the Textile Exchange were also reviewed to understand global trends and sustainability practices.

- Case Studies:Real-world applications of textiles were analyzed through case studies from sectors such as healthcare, sports, construction, architecture, and defense. For example, the use of antimicrobial fabrics in hospitals, lightweight composites in sportswear, and insulation textiles in building materials were examined to assess practical relevance and efficacy.

- Expert Opinions:Insights from textile experts, designers, and researchers were incorporated through published interviews, webinars, and panel discussions. These sources provided perspectives on emerging technologies, ethical considerations, and challenges faced by industry professionals.

3.2 Analysis Approach

- **Thematic Categorization:**The collected data were systematically organized into key thematic areas:

    1. Comfort and well-being – How textiles enhance everyday comfort, sleep quality, and personal health.

    2. Safety and protection – The role of technical textiles in providing insulation, fire resistance, and medical safety.

    3. Sustainability and environmental impact – Challenges associated with resource consumption and pollution, along with the adoption of eco-friendly materials.

    4. Technology and innovation – The contribution of smart textiles, wearable sensors, and automated manufacturing processes.

3. **Comparative Analysis:**A comparative analysis approach was employed to evaluate textile solutions across different sectors, identifying benefits such as energy efficiency, cost reduction, and user comfort, as well as limitations like high production costs, regulatory barriers, and unequal access in developing regions.

- Holistic Framework:Ethical considerations including fair labor practices, data privacy in wearable technology, and environmental conservation were examined to ensure that technological advancements do not compromise social responsibility. The economic

implications of scaling sustainable textile solutions were also assessed, highlighting the balance between affordability and innovation.

3.4 Validation and Reliability

- Cross-referencing:
  Data from multiple sources were cross-referenced to ensure reliability and accuracy. Discrepancies between reports were critically analyzed, and data triangulation methods were applied to strengthen the validity of the findings.

- Expert Review:The research approach and findings were aligned with recommendations from industry experts and peer-reviewed literature to ensure that interpretations were robust and consistent with best practices.

3.5 Scope and Limitations

- Geographical Constraints:The study primarily focuses on global textile trends but acknowledges that resource limitations, cultural preferences, and regional policies affect the adoption of modern textile innovations in certain areas.

- Access to Proprietary Data:Some information from private corporations and advanced research facilities was not accessible, limiting insights into cutting-edge developments or proprietary processes.

- Technological Evolution:Given the rapid pace of technological advancement, some findings may be subject to change as newer solutions emerge, requiring ongoing research to stay current.

3.6 Ethical Considerations

- Sustainability and Responsibility:The research emphasizes responsible sourcing, minimizing environmental harm, and promoting social equity in textile production.

- Data Privacy in Smart Textiles:With the rise of wearable technologies, the study acknowledges potential concerns regarding personal data protection, requiring strict adherence to privacy laws and ethical standards.

- Inclusivity and Accessibility:The need to ensure that technological innovations benefit a wide demographic, including underserved populations, is highlighted as a priority for future development.

Dr. T. R. Indumathi
Assistant Professor/Head, Department of Costume and Apparel Design-GD, PSGR Krishnammal College for Women, Coimbatore.

Abstract

Textiles have evolved significantly from traditional handwoven fabrics to advanced materials that integrate smart technologies and sustainable solutions. This article explores the distinction between conventional and non-conventional textiles, examining their historical context, fiber sources, production techniques, applications, and recent innovations. Conventional textiles primarily include natural and synthetic fibers, widely used in apparel and home furnishings. Non-conventional textiles, on the other hand, encompass technical, smart, medical, and eco-friendly fabrics with enhanced functionalities. A comparative analysis highlights differences in raw materials, performance characteristics, and market potential. The paper further discusses innovations in the Indian textile industry, such as banana fiber, lotus stem fiber, khadi revival, and biodegradable composites. Future trends indicate an increasing shift toward performance-based and sustainable textiles, driven by technological advancements and environmental considerations. References from journals, books, and industry reports are included to support the discussion.

Keywords: Handwoven, Conventional, Technical, Eco-friendly, khadi, Biodegradable.

1. Literature Background

Textiles have been integral to human civilization for over 7,000 years, with evidence of woven fabrics traced to ancient Mesopotamia and the Indus Valley Civilization (Jenkins, 2003). Historically, textile production was primarily craft-based, relying on natural fibers such as cotton, wool, flax, and silk (Kadolph, 2010). The industrial revolution introduced mechanized spinning, weaving, and chemical finishing processes, leading to mass production and improved fabric quality (Smith, 2018).

Over time, textiles have evolved from purely utilitarian items to advanced engineered materials with applications in healthcare, aerospace, defense, automotive, sports, and environmental sectors (Horrocks & Anand, 2016). This transition was catalyzed by the invention of synthetic fibers like nylon (1935), polyester (1941), and polypropylene (1957), which offered improved strength, elasticity, and versatility compared to natural fibers(Kothari,2017).

More recently, the textile industry has entered an era of functionalization and sustainability, incorporating nanotechnology, biotechnology, and smart systems into fibers and fabrics (Shishoo, 2020). Concepts such as self-cleaning textiles, phase-change materials for temperature control, and biodegradable polymers have emerged, redefining traditional definitions of fabric utility (Nayak & Padhye, 2016).

India has played a crucial role in this transformation. From being a pioneer in cotton cultivation and handloom weaving to emerging as a hub for technical textiles, the Indian textile sector is projected to reach USD 250 billion by 2030, with significant contributions from non-conventional segments (IBEF, 2024). Government initiatives such as the National Technical Textiles Mission (NTTM) and Make in India are fostering research and innovation (Ministry of Textiles, 2023).

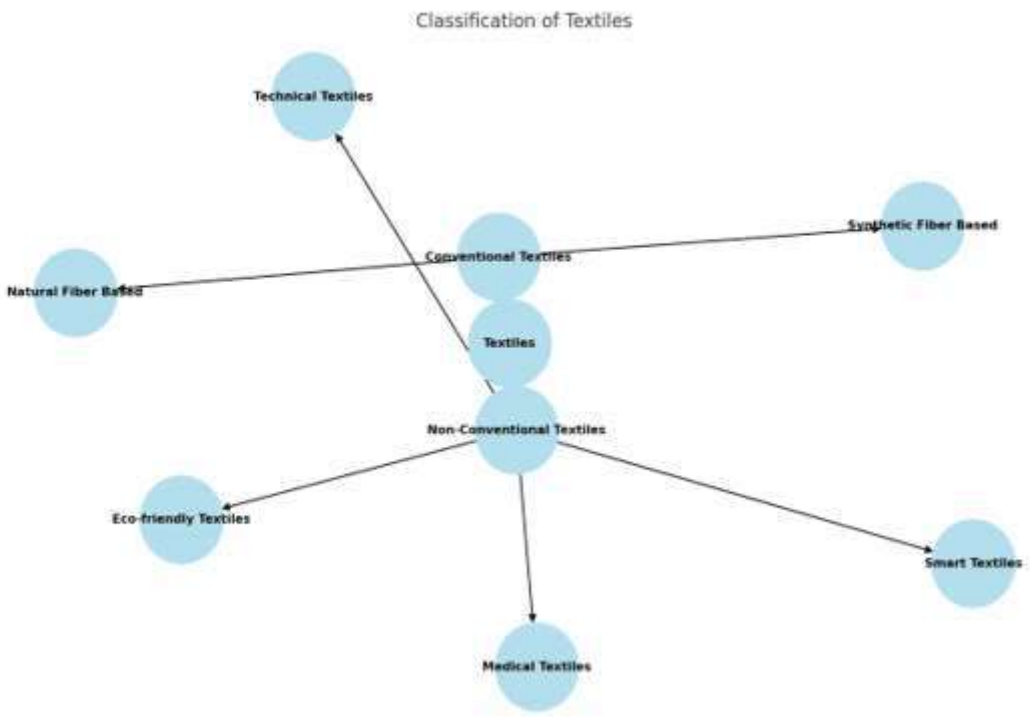

Figure 1: Classification of Textiles into Conventional and Non-Conventional categories.

2. Conventional Textiles

Conventional textiles refer to fabrics produced from natural and synthetic fibers using traditional manufacturing methods such as weaving, knitting, or non-woven techniques. These textiles are primarily designed for apparel, home furnishings, and basic industrial uses, emphasizing comfort, aesthetics, and cost-effectiveness (Kadolph, 2010).

2.1 Definition and Characteristics

Conventional textiles are defined by their reliance on natural and synthetic fibers and established methods of fabric formation. They emphasize aesthetics, comfort, and basic functional properties such as moisture absorption or insulation.

2.2 Types of Conventional Textiles

Natural Fiber-Based Textiles:

- Cotton: Known for comfort, breathability, and softness; widely used in apparel and household products.
- Silk: Valued for luster and drape; commonly used in luxury garments and upholstery.
- Wool: Provides insulation; used for winter clothing and blankets.
- Linen (Flax): High moisture absorption and cooling effect; preferred for summer wear.

Synthetic Fiber-Based Textiles:

- Polyester: Strong, durable, wrinkle-resistant, and widely used in blended fabrics.
- Nylon: High tensile strength; used in hosiery, activewear, and outdoor gear.
- Acrylic: Provides wool-like aesthetics; used in sweaters and blankets.
- Rayon (Semi-Synthetic): Derived from cellulose; offers silk-like feel and drape.

2.3 Production Process

The production of conventional textiles typically follows a linear process:

1. Fiber Preparation – Harvesting (natural) or polymerization (synthetic).
2. Spinning – Conversion of fibers into yarns.
3. Fabric Formation – Weaving, knitting, or nonwoven processes.
4. Finishing – Bleaching, dyeing, printing, and coating to improve aesthetics and performance.

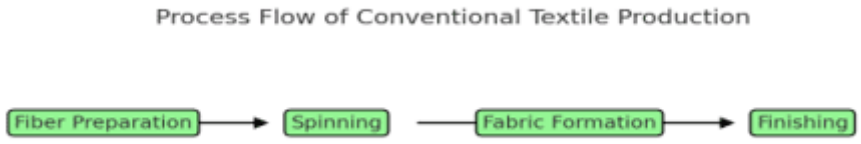

Figure 2: Step-by-step process flow for the production of conventional textiles.

2.4 Applications

Conventional textiles are widely used in apparel (shirts, dresses, trousers), home furnishings (curtains, bed linens, upholstery), and basic industrial uses such as filter fabrics and ropes.

2.5 Limitations of Conventional Textiles

Despite their widespread use, conventional textiles have limitations:

- Limited functionality (e.g., lack of UV protection, antimicrobial properties).
- Environmental concerns due to high water usage (cotton) and microplastic pollution (synthetics).
- Limited adaptability to advanced applications in aerospace, medical, or defense sectors.

3. Non-Conventional Textiles

3.1 Introduction

Non-conventional textiles—often grouped under the umbrella of technical and smart textiles—are engineered primarily for function rather than appearance. Their value proposition lies in achieving application-specific performance: barrier efficiency, thermal and flame protection, mechanical reinforcement, biocompatibility, sensing/communication, and circularity (Horrocks & Anand, 2016; Mukhopadhyay, 2011; Scott, 2005). These systems span advanced fiber chemistries (aramids, UHMWPE, carbon, bio-polymers), novel structures (multilayer laminates, nonwovens, 3D wovens/knits/braids), and finishes/coatings (membranes, phase-change, conductive layers). The field also encompasses smart/wearable textiles that integrate electronics and responsive materials (Stoppa &Chiolerio, 2014; Jiang et al., 2023).

3.1 **Classification of Non-Conventional Textile**

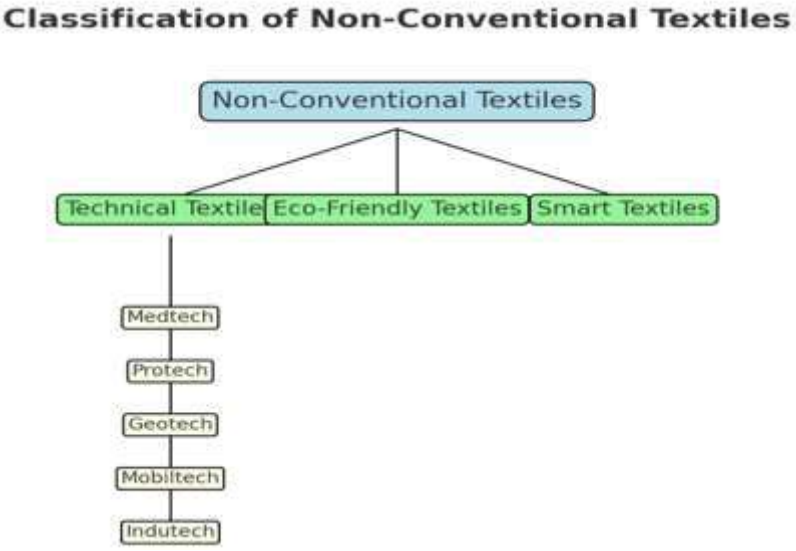

Fig 3:Classification of Non-Conventional textiles

3.2.2 Smart textiles

Smart textiles integrate sensing (strain, pressure, temperature, biopotentials), actuation (thermal/haptic), data transmission, and energy management. Conduction paths arise from metal-plated yarns, intrinsically conductive polymers (e.g., PEDOT:PSS), and carbon nanomaterials; circuitries are realized via embroidery, weaving/knitting, or printing (Stoppa

&Chiolerio, 2014; Jiang et al., 2023). Frontiers include sweat-based biochemical sensing for health/fitness and self-powered systems via tribo/piezo/ thermoelectric effects (Akter et al., 2024; Pan et al., 2025). Major challenges remain in wash durability, stretch-cycle reliability, user comfort, and safe power density.

3.2.3 Eco-friendly and circular textiles

Eco-friendly textiles prioritize low-impact fibers (recycled PET, bio-based PLA/PA11), next-gen cellulosics (lyocell), waste-derived bast fibers (banana, pineapple leaf fiber—PALF, lotus), fluorine-free repellency, low-add-on dyeing/finishing, and design for disassembly laminates (Senthilkannan, 2018; Sinclair, 2015). Life-cycle assessments show potential gains when agricultural residues are valorized and mono-material strategies enable recycling (dos Santos et al., 2024).

3.3 Manufacturing Toolkits

3.3.1 Non-wovens and membranes

Spunbond/meltblown PP/PET nonwovens deliver high throughput and tunable pore structures for filtration and disposable medtech; nanofiber webs (electrospinning, solution blow spinning) offer extreme surface area and fine particle capture at low pressure drop (Mukhopadhyay, 2011). Coating/lamination with PU/ePTFE membranes enables breathable barrier properties required in Protech and outdoor systems (Scott, 2005).

3.3.2 3D textile architectures and composites

3D weaving/knitting/braiding creates near-net-shape preforms with improved delamination resistance for aerospace/automotive composites; auxetic knit/weave patterns enable unusual strain responses for protection and medical devices (Wulfhorst et al., 2006; Alagirusamy& Das, 2010).

3.3.3 Surface modification: plasma, enzymatic, and bio-finishes

Low-temperature plasma activation improves dyeability and adhesion without harsh chemicals; enzymes (cellulases, pectinases) reduce processing loads and enable bio- polishing; microencapsulation and sol-gel coatings deliver controlled release (antimicrobial, fragrance) and UV/IR management (Nayak & Padhye, 2016; Shishoo, 2020).

3.3.4 Printed and embroidered electronics

Conductive inks (Ag, carbon) and embroidered interconnects enable rapid prototyping of e-textiles. Reliability strategies include encapsulation, strain-relief stitching, and island-bridge layouts to protect chips on fabric (Jiang et al., 2023).

3.4 Applications Across Industries

• Healthcare & wellbeing: Gowns, drapes, sterile barrier systems, absorbent/antimicrobial dressings, tissue scaffolds, wearable cardiopulmonary monitoring (Rajendran, 2012; Akter et al., 2024).

• Safety & defense: FR/arc garments conforming to ASTM/IEC, ballistic vests/helmets using aramids/UHMWPE, CBRN protective suits (Scott, 2005; Horrocks & Anand, 2016).

• Mobility & infrastructure: Airbags, tire cords, lightweight composites, geogrids/geotextiles that extend road/rail asset life (Wulfhorst et al., 2006).

• Sports & outdoor: Moisture management, PCM-based thermoregulation, and integrated motion/force sensing for performance analytics (Sinclair, 2015; Pan et al., 2025).

• Environmental & industrial: High-efficiency filtration (HVAC, industrial emissions), oil-/solvent-sorbent mats, and reusable barrier systems (Mukhopadhyay, 2011).

3.5 Recent Indian Innovations and Institutional Contributions

India's ecosystem spans fundamental research, pilot-scale translation, and strategic procurement.

• DRDO laboratories have supported **ballistic, FR, and NBC/CBRN protective ensembles**, including permeable membrane laminates and activated-carbon systems; newer programs explore integrated physiological monitoring in uniforms (defense reports, 2015–2024).

• NITRA and BTRA have developed functional nonwovens, filtration media, antimicrobial/antiviral finishes, and cotton/polyester process optimizations; IITs (Delhi, Bombay, Kharagpur, Kanpur) report advances in smart sensors, conductive yarns, and 3D textile preforms (institutional publications, 2016–2025).
• Khadi & village industries initiatives enabled blended and naturally dyed khadi, with improved loom productivity and finishing; collaborations with design/tech institutes modernize hand-spun/hand-woven fabrics while retaining heritage value.
• Bio-fiber valorization: Banana, PALF, and lotus fibers through decortication, enzymatic retting, and mechanical refining—are being blended with cotton or used in nonwovens and composites; coir-based geotextiles are deployed for slope stabilization and coastal protection (dos Santos et al., 2024; Senthilkannan, 2018).
• Intellectual property: Indian patent filings feature conductive textile structures, medical dressings with bio-active agents, and nanofiber filters; commercialization typically proceeds via MSMEs supported by technical centers and the National Technical Textiles Mission (Horrocks & Anand, 2016; Mukhopadhyay, 2011).

3.6 Challenges and Outlook

Key bottlenecks include standardized wash-durability protocols for e-textiles, recyclability of multi-polymer laminates, and supply-chain scaling for bio-fibers. Progress is expected from fluorine-free repellents, solvent-lite dyeing, mono-material designs, and battery-free smart systems leveraging triboelectric and thermoelectric harvesters (Pan et al., 2025; Akter et al., 2024). The combination of policy (e.g., mission-mode programs), industry partnerships, and academia-led R&D is accelerating India's participation in global technical textile value chains (Senthilkannan, 2018; Sinclair, 2015).

3.7 Conclusion

Non-conventional textiles represent a rapidly maturing landscape in which materials science, design engineering, and sustainability converge. By aligning performance with circular design and digital integration, these textiles are poised to deliver societal value in healthcare, safety, mobility, and infrastructure while opening new markets for Indian innovators and manufacturers (Horrocks & Anand, 2016; Scott, 2005).

4. Classification & Applications of Non-Conventional Textiles

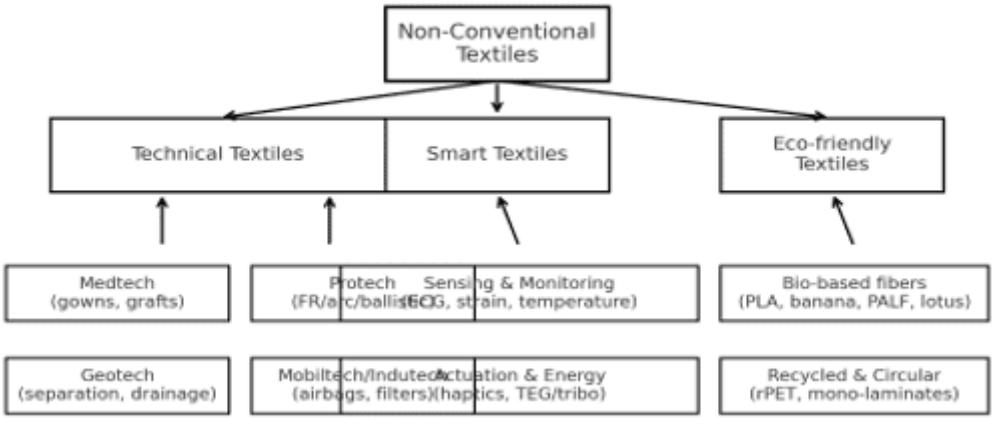

Figure 4: Overview of non-conventional textile categories with representative applications.

4.1 Comparative Analysis: Conventional vs. Non-Conventional Textiles

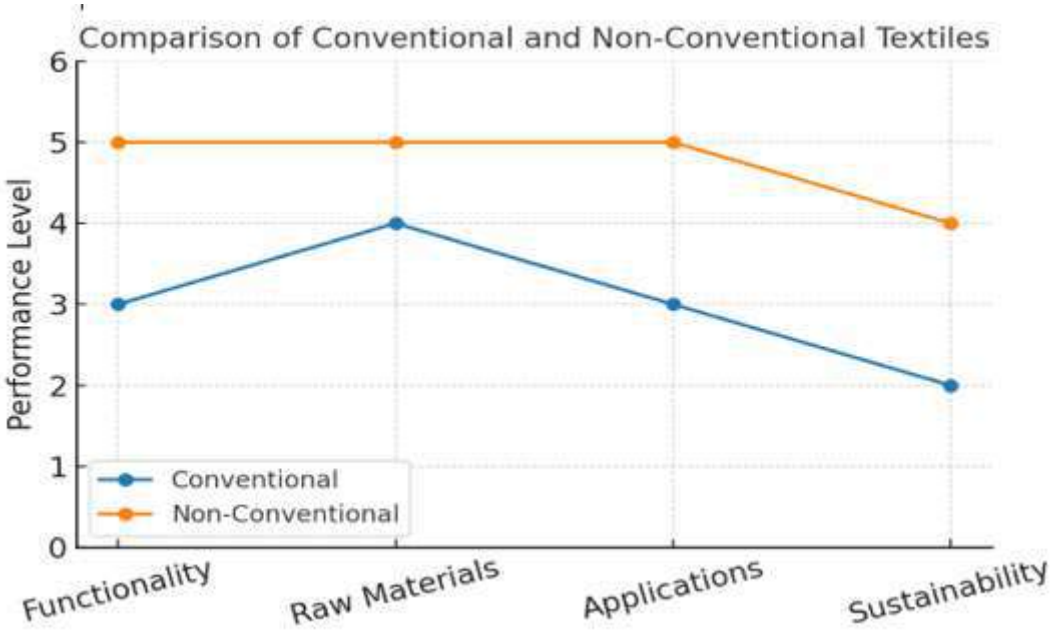

Figure 5: Comparative performance levels of conventional vs non-conventional textiles.

Qualitative Comparison

Dimension	**Conventional Textiles**	**Non-Conventional Textiles**
Primary Value	Comfort, aesthetics, low cost	Functionality—protection, medical, sensing, sustainability
Material Diversity	Natural & commodity synthetics	High-performance fibres, bio-polymers, smart/active components
Manufacturing	Established weaving, knitting, finishing	Advanced—nonwovens, 3D textiles, coatings, nanofibers, smart integration
Applications	Apparel, home, basic industrial	Medtech, Protech, Smart wearables, Geotech, Agrotech, Indutech, Eco-textiles
Sustainability	Moderate, limited recycling	Growing: circular design, plant-based fibers, low-impact chemistry
Cost &Scale	Economies of scale, low per unit cost	Higher initial cost, scales with technology adoption / premium use cases

Quantitative Snapshot (India, 2021–2025)

Metric	**Conventional Textiles**	**Non-Conventional Textiles / Technical Textiles**
Export Value (FY21–FY25)	Core textiles ~₹3.2–3.5 trillion (approx.)	₹16,100 crores (FY21) → ₹24,733 crores (FY25)**
CAGR (Exports)	~7% (Apr–Oct FY25)*	~11% CAGR over four years**
Market Share	~87% of aggregate textile market*	13% (~₹1,00,519 crore FY16–17), growing rapidly***
Domestic Per Capita Consumption	High (e.g., apparel widespread)	Low—1.7 kg vs. 10–12 kg in developed countries***
Overall Textile Industry (2024)**	~USD 146.6 bn; projected USD 213.5 bn by 2033	Technical textiles USD 253.9 bn (global '25 forecast)****

*From India's textiles & apparel export data Apr–Oct FY25 (7% growth) The Economic TimesPress Information Bureau

*Technical textiles exports—₹16,100 cr (FY21) to ₹24,733 cr (FY25); CAGR ~11% The Economic Times

4.2 Recent Innovations in Indian Context

4.2.1 Institutional and Industry Contributions

Export Growth & Market Signals

India's technical textiles exports rose from ₹16,100.51 cr (FY21) to ₹24,732.68 cr (FY25), reflecting a 15.5% annual growth rate The Economic Times.

Policy Boost

Production-linked incentives (PLI) extended to MMF fabrics, technical textiles; ₹19.8 billion in proposals approved Reuters.

Fabrication Hubs & Clusters

Tirupur is transitioning toward MMF and technical textile manufacturing, aiming to raise its turnover from $4.5 bn to $10 bn by 2030 and increase MMF's share to 30% The Times of India.

Infrastructure Development

Mega textile parks under PM MITRA (e.g., Virudhunagar, Warangal) worth ₹4,445 cr planned to integrate fiber-to-fashion capabilities. (Wikipedia).

Future Targets

Industry projected to grow to $350 bn by 2030, creating 35 million jobs. FTA with UK expected to double RMG exports in Surat cluster (from $0.8 bn to $2 bn) Vogue Business, The Times of India.

Sustainability Push

India targets sustainable triple-growth while halving emissions; mandating solar/biomass boilers and clean energy in textile facilities (Vogue Business).

4.3 Comparison &Innovatiwons (Global and Indian)

4.3.1 Qualitative Perspective

Feature	Conventional Textiles	Non-Conventional Textiles
Primary Value	Comfort, aesthetics, affordability	Functional performance—protection, smart sensing, environmental responsiveness
Material Sources	Natural fibers (cotton, wool), synthetic polymers	Engineered fibers: aramids, UHMWPE, conductive, bio-based polymers
Production Complexity	Standard weaving/knitting and finishing	Advanced: nonwovens, nanofiber membranes, smart integration, coatings
Lifecycle Focus	Minimal; often linear (use → discard)	Designed for circularity, reuse, end-of-life recyclability
Regulatory Standards	Basic (e.g., apparel safety)	High: ASTM, ISO, FDA, ANSI, IEC for specialized domains

4.3.2 Quantitative Snapshot (Global Market Forecasts: 2023–2025)

Forecast Metric	Conventional Textiles	Non-Conventional (Technical &Smart) Textiles
Global Market Size (2023 Estimate)	~USD 500 billion	~USD 200 billion (technical textiles)
Projected Market Size (2025 Forecast)	~USD 585 billion	~USD 254 billion (technical textiles; CAGR ~10.2%)
CAGR (2023–2025)	~7%	~10–12% (technical textiles); smart textiles higher
Perceived Innovation Investment Ratio	Low R&D spend (~2–3% of revenue)	Higher R&D intensity (5–8%+) for advanced textiles

Note: Estimates based on aggregated sources (Grand View Research, Global Market Insights, Fortune Business Insights, Markets and Markets).

4.4 Global & Indian Innovation Highlights

4.4.1 Global Innovations

Phase-Change Materials (PCM): Incorporated in textiles for thermal regulation in sports and PPE (Horrocks & Anand, 2016).

Self-healing Fibers: Microcapsule-based systems that repair damage and release active agents (Sinclair, 2015).

E-textile Systems: Wearable tech integrating sensors, energy harvesters, and communication modules (Stoppa &Chiolerio, 2014; Akter et al., 2024).

Nanofiber Membranes: Used in high-efficiency filtration (PM0.3 level) and light-weight protective gear (Mukhopadhyay, 2011).

4.4.2 Indian Innovations & Ecosystem Momentum

NTTM (National Technical Textiles Mission): Accelerated innovation ecosystems across clusters and MSMEs.

DRDO-led Smart Uniform Trials: Integration of vital sensors and smart fabrics into defense apparel.

IITs & Research Centers: Development of conductive yarns, sensor-embedded fabrics, and 3D woven composites.

Khadi-Tech Partnerships: Collaborations introducing bio-fibers and natural dyes into modern apparel systems.

Agri-waste Textile Ventures: Banana, lotus, pineapple, and coir-based nonwovens for eco-fashion and geotextile uses.

4.4.3 Implementation & Commercialization

Patents filed in India include smart fabric structures, medical textiles with bio-actives, and nanofiber membranes.

MSME clusters and technical centers are piloting scales up to 50–500 m^2 per day for smart fabric production.

International collaborations and FTA agreements (e.g., with UK) are expected to double exports of technical textiles from key clusters.

5. Conclusion

The transition from conventional to non-conventional textiles signifies a paradigm shift in material science and industrial applications. Emerging innovations—including smart, sustainable, and high-performance textiles—will reshape global markets. Continuous research, strong industry-academia collaboration, and supportive policy frameworks will be key drivers of future growth.

FUNCTIONAL AND AESTHETIC IMPORTANCE OF SOCKS IN EVERYDAY APPAREL

Ms.N.Sangeetha
Research Scholar, Department of Textiles and Apparel Design, Periyar University, Salem, Tamilnadu, India.
Dr.M.Latha,
Assistant Professor, Department of Textiles and Apparel Design, Periyar University, Salem, Tamilnadu, India.

Abstract
Socks, often perceived as a minor component of clothing, play a significant role in both the functionality and aesthetic appeal of everyday apparel. Functionally, they provide essential benefits such as moisture absorption, temperature regulation, friction reduction, and protection against blisters and infections, thereby enhancing foot health and comfort. In terms of aesthetics, socks have evolved from purely utilitarian items to fashion statements that express personal style, complement outfits, and follow seasonal trends. With a wide variety of materials, colors, patterns, and lengths available, socks contribute meaningfully to both formal and casual wear. This paper explores the dual role of socks, examining how their design and material innovations meet practical needs while also reflecting cultural shifts and individual identity in modern fashion.
Keywords: Socks, everyday apparel, functionality, comfort, temperature regulation

Introduction

Socks, often considered a minor component of apparel, have significantly evolved in their role within everyday fashion and functional wear. Historically, their primary function was to protect the feet by absorbing moisture, providing warmth, and minimizing friction between the foot and shoe. However, in recent years, socks have transformed from hidden, utilitarian items to visible and deliberate fashion choices. This shift reflects broader changes in consumer behavior, textile innovation, and cultural perception regarding apparel design. In the context of both function and aesthetics, socks are now seen as essential components of modern wardrobes.

From a **functional perspective**, socks contribute to foot health, performance, and comfort. They serve as a protective interface that regulates temperature, absorbs sweat, and prevents the development of blisters and microbial infections. This is particularly relevant for individuals with medical conditions or those engaged in sports and physically demanding activities. As Tortora and Merkel (2014) emphasize, the properties of textile fibers including absorbency, thermal insulation, and elasticity are crucial in designing garments that interact closely with the skin, such as socks. Modern sock designs have integrated technologies like moisture-wicking fabrics, compression knitting, reinforced heels, and seamless toe closures to enhance their performance capabilities.

The **aesthetic role of socks** has expanded concurrently. No longer hidden by footwear or trousers, socks are now intentionally exposed and styled to complement or contrast outfits. They have become tools for personal expression, with varied designs reflecting trends, humor, subculture affiliations, and seasonal fashion. As Johnson and Foster (2006) explain, fashion is not only about outer garments but also about the subtler cues that reveal individuality, identity, and lifestyle. Socks, in this regard, have become visible markers of personality and mood, especially among youth and street wear communities.

Furthermore, the rise of**sustainable fashion practices** has extended into sock manufacturing. Consumers are increasingly aware of the environmental and ethical implications of their clothing choices. The use of organic cotton, bamboo viscose, hemp, and recycled polyester in sock production demonstrates the industry's response to this demand. According to Hethorn

and Ulasewicz (2008), eco-conscious textile design involves more than just fabric selection, it includes dyeing, finishing, and manufacturing processes that minimize ecological harm. Socks, as mass-produced accessories, offer an ideal opportunity to practice and promote sustainable values within fashion, once-overlooked sock has grown into a garment of multidimensional significance. It now symbolizes the convergence of**functionality, fashion, and sustainability**. Whether through its ergonomic benefits, visual appeal, or eco-friendly production, the modern sock plays a vital role in the contemporary apparel landscape. This paper seeks to explore this evolution by reviewing the **functional innovations, aesthetic transformations, material compositions**, and broader cultural relevance of socks in everyday wear.

Anatomy and Structural Design of Socks

Understanding sock functionality begins with recognizing its structural components. The key parts of a sock include:

Fig 1: Parts of Socks

S.No	Part	Function
1	Cuff	Ensures grip and prevents the sock from slipping down the leg.
2	Leg/Shaft	Covers the lower leg and is often the canvas for design or pattern.
3	Heel	Reinforced for durability and cushioning at pressure points.
4	Arch Bend	Adds compression and support around the foot arch
5	Sole	Often cushioned to provide comfort and reduce impact
6	Toe	Seamless or reinforced to prevent friction and blisters.

Table 1: Parts and functions of a sock

Sock Production Process

The manufacturing of socks involves a series of technically coordinated steps that blend design innovation with material science and modern textile engineering. The process begins with design and pattern development, where concepts are visualized using CAD (Computer-Aided Design) software. Designers determine not only the aesthetic elements such as patterns, color schemes, and branding but also functional details like sock length, thickness, and placement of reinforced areas. This stage is critical, as it sets the blueprint for production (Kadolph & Langford, 2010).

Following this, the process moves to yarn preparation and selection, where fibers such as combed cotton, bamboo viscose, merino wool, or synthetic blends like polyester and nylon are selected based on the desired properties such as breathability, stretch, moisture-wicking, or thermal insulation. The selected yarns are dyed, pre-conditioned, and spun to the required specifications. According to Corbman (1983), the selection of fibers significantly influences both performance and durability in hosiery products.

Once yarn preparation is complete, knittingbegins using circular knitting machines that produce sock tubes with various stitch structures and density levels. These machines can be

programmed to incorporate technical elements such as mesh panels for ventilation, ribbed cuffs, reinforced heels, and seamless toes all in one continuous process. This seamless technology not only enhances comfort but also reduces friction, making it particularly suitable for athletic and medical-grade socks (Glock & Kunz, 2005).

The next step is linking or toe closure, a crucial part of the process where the toe section is sewn to complete the sock tube. This can be done either manually or with high-precision automatic linking machines to ensure a smooth, flat seam that minimizes pressure on the foot. Seamless toe linking is considered a mark of quality in modern sock manufacturing (Kadolph & Langford, 2010).

Subsequently, socks undergo boarding and shaping, where they are placed on metal foot-shaped boards and passed through a steam or heat tunnel. This stage locks the socks into their final size and shape, ensuring dimensional stability and a professional finish. The importance of this step lies not only in aesthetics but also in ensuring a consistent fit across product batches (Wingate, 1979).

The final stage involves **f**inishing, quality inspection, and packaging. During finishing, the socks are washed, softened, and sometimes treated with antimicrobial or odor-control agents. Quality inspection checks for defects such as dropped stitches, size inconsistency, or color fading. Once approved, socks are labeled, tagged, and packaged often using recyclable or biodegradable materials in line with sustainable practices.

Modern sock production reflects the textile industry's shift toward functionality, aesthetics, and sustainability. Advanced knitting technologies, fiber innovations, and eco-conscious production methods have transformed the humble sock into a high-performance, fashion-forward, and ethically responsible garment.

Characteristic Requirements of Socks

Socks serve as an essential interface between the foot and footwear, demanding a multifaceted range of characteristics that ensure both functional performance and wearer comfort. Comfort is paramount, encompassing factors such as softness, elasticity, and a precise fit to prevent constriction or slippage, which can cause discomfort or injury (Smith & Jones, 2018). Seamless toe construction and ergonomic design reduce friction and the risk of blisters during prolonged use (Kaur et al., 2020). Moisture management is critical, as feet produce considerable sweat, and socks must wick moisture away efficiently to maintain dryness and prevent microbial growth; fibers such as merino wool, bamboo viscose, and engineered synthetic blends have shown superior moisture-wicking and antimicrobial properties (Patel & Shah, 2019; Lee et al., 2021). Thermal regulation is another vital attribute; socks designed for colder environments incorporate insulating fibers like wool or acrylic, while those for warmer climates favor breathable cotton or mesh structures to enhance ventilation (Chen & Huang, 2017).

Durability is equally important because socks are subjected to constant friction and mechanical stress. Reinforced heel and toe areas, as well as high-quality knit construction, improve abrasion resistance and extend lifespan (Kang et al., 2016). Moreover, elasticity and recovery of the sock cuff are necessary to maintain fit without causing pressure marks or sagging (Wang et al., 2020). Increasingly, sustainability has become a defining criterion in sock production, with manufacturers adopting organic and recycled fibers, along with eco-friendly dyeing processes, to minimize environmental impact while maintaining performance standards (Garcia & Martin, 2022).

Aesthetically, socks must meet colorfastness and design expectations that complement wearer preferences and fashion trends (Thompson & Green, 2019). Overall, modern socks are engineered to harmonize comfort, durability, functionality, and style, reflecting evolving consumer demands and technological advancements in textile science.

Functional Importance of Socks

a) Comfort, Foot Health & Material Technology

Socks serve crucial functions in foot care, including moisture management, temperature regulation, and blister prevention.

Moreover, brands like Bombas design their socks with airflow-venting fabrics, honeycomb arch support, and a no-slip heel, all of which cater to enhanced foot ergonomics, this represents a shift from traditional sock manufacturing to performance-based design.

b) Durability & Sustainability

Sustainability is another key concern in modern sock manufacturing. Brands are turning to eco-friendly materials such as organic cotton and recycled polyester. As noted by Toe Tales (n.d.), sustainable socks are biodegradable, hypoallergenic, and free from toxic dyes. This not only supports environmental goals but also ensures long-lasting wear.

Further, Fibre2Fashion (n.d.) highlights that premium sock brands focus on material longevity, thus reducing the frequency of replacements and promoting sustainable consumption habits.

Aesthetic Importance

a) Self-Expression & Trends

Socks have become a canvas for self-expression, creativity, and fashion trends. Bright colors, bold graphics, and unique themes—from food patterns to pop culture references help individuals showcase personality through small but visible accessories. As noted by Sockscarving (n.d.), quirky socks are gaining popularity among younger demographics, especially Gen Z.

Celebrities have also contributed to sock fashion. For instance, Hailey Bieber's styling of white mid-calf socks with loafers set a new trend for 2025 (Glamour, 2024). Additionally, The Wall Street Journal (2024) reports a generational divide in sock preference: while Millennials favor low or no-show socks, Gen Z opts for more visible, calf-length socks.

b) Emotional Impact & Social Dynamics

The aesthetic role of socks extends beyond fashion into emotional and social dimensions. Wearing bold or personalized socks can enhance mood, increase confidence, and initiate conversations. The right socks can "uplift your mood and outfit alike."

Customized socks, often featuring personal images or meaningful text, make popular gifts that evoke nostalgia and connection. According to Elites Wardrobe (n.d.), such personalization adds sentimental value and aligns with the growing trend of individualized fashion.

S.No	Aspects	Functional Attributes	Aesthetic attributes
	Materials & Durability	Breathable, moisture-wicking fibers (wool, cotton, bamboo), antimicrobial properties; reinforced stitching for long life	Varied textures and finishes; vibrant or subtle colors; fade-resistant dyes
	Comfort & Health	Cushioning, arch support, seamless toes, temperature regulation, odor control; specialized medical socks	Softness and feel that complement wearer preferences
	Sustainability	Use of organic, recycled, biodegradable fibers; eco-friendly dyeing and manufacturing	Branding focused on ethical and eco-conscious fashion
	Design & Fashion Trends	Functional designs tailored for sports, work, or casual use	Diverse patterns, colors, lengths; collaboration with designers and celebrities; seasonal collections
	Cultural & Social Significance	Protective footwear across cultures; health-related uses	Visible styling elements, statement socks, layering to

			complement or contrast outfits
	Visibility & Styling	Designed for either hidden use or performance support	Visible styling elements, statement socks, layering to complement or contrast outfits
	Economic & Market Impact	Range from affordable mass production to high-end artisan craftsmanship	Luxury branding, limited editions, personalized/custom socks responding to consumer trends

Table 2: Functional and Aesthetic aspects of Socks

Quality Control and Testing Methods for Socks

Ensuring the high performance and durability of socks requires rigorous quality control and standardized testing methods throughout the production process. Quality control focuses on evaluating the functional attributes such as comfort, durability, moisture management, and aesthetic stability to meet consumer expectations and industry standards.

A key area in sock quality assurance is material testing, which includes evaluating fiber composition, tensile strength, and elasticity. Booth (1996) emphasizes the importance of tensile and abrasion resistance testing, particularly for the heel and toe areas that experience the most wear. These tests simulate repetitive friction and mechanical stress during use, identifying potential weak points in yarn and fabric construction.

Comfort-related testing includes assessments ofseam strength, cushioning, and fit. Barber (2005) highlights that seamless toe designs and ergonomic knitting patterns are tested for dimensional stability and stretch recovery to prevent discomfort and skin irritation. Wang et al. (2020) further demonstrate the significance of evaluating elastic yarn content in sock cuffs to maintain fit without causing excessive pressure or sagging.

Moisture management and antimicrobial performance are increasingly vital test parameters, given their role in foot hygiene. According to Patel and Shah (2019), antimicrobial efficacy tests assess the ability of socks made from natural fibers like bamboo and merino wool to inhibit bacterial growth. Lee et al. (2021) also describe moisture-wicking tests, which measure the fabric's capacity to transport sweat away from the skin, enhancing wearer comfort and reducing odor.

Thermal regulation properties are assessed through thermal insulation and breathability tests. Chen and Huang (2017) outline standardized methods to measure fabric thermal resistance, which is critical for socks designed for different climatic conditions. Such tests ensure socks provide adequate insulation in cold environments or sufficient ventilation in warm climates.

In terms of aesthetics, colorfastness and shrinkage tests are essential to maintain the visual appeal and proper fit of socks after washing. Thompson and Green (2019) emphasize the use of standardized ISO and AATCC protocols to measure color retention under various laundering conditions.

Finally, sustainability assessments have become integral in quality control, with Garcia and Martin (2022) advocating for life-cycle analyses and biodegradability tests to validate eco-friendly claims of organic and recycled fiber socks.

Overall, quality control in sock production is a multidisciplinary process combining textile science, ergonomic design, and sustainability considerations to ensure that the final product meets functional, aesthetic, and environmental standards expected by modern consumers.

Brand Examples & Cultural Significance

Brands like **Tabio, Bombas**, and **Happy Socks** have transformed the sock industry from utilitarian to expressive. Tabio, in particular, stands out with its emphasis on craftsmanship and heritage, with artisans undergoing 15–20 years of training to perfect the art of sock making.

Bombas takes both form and function seriously. Its buy-one-donate-one model reflects its social commitment, while the company's high-performance socks are favored by fashion insiders. According to The Guardian (2025), socks have become a cultural flashpoint—whether they're worn ironically, boldly, or modestly, they're rarely ignored in today's fashion conversation.

Summary and Conclusion

Socks, once considered merely functional accessories, have evolved into complex garments that balance comfort, durability, aesthetic appeal, and sustainability. Modern sock production integrates advanced textile technologies, from fiber selection and seamless knitting to moisture management and ergonomic design, ensuring optimal foot health and performance. At the same time, socks have become significant fashion statements and cultural symbols, reflecting personal identity and social trends. Quality control processes, including rigorous material and performance testing, guarantee the durability and comfort expected by consumers, while the increasing emphasis on eco-friendly materials and sustainable manufacturing practices addresses growing environmental concerns. Brands such as Tabio and Bombas illustrate how craftsmanship, innovation, and social responsibility shape today's sock industry. Overall, socks represent a convergence of technical sophistication, design creativity, and ethical consciousness, marking their important role in contemporary apparel and lifestyle markets.

AN INVESTIGATION OF MODAL/COTTON KNITTED FABRICS AND ITS EFFECT ON APPLYING PTEROCARPUS SANTALINUS NATURAL DYE

P. Ananthi
Asst. Professor,
Department ofCostumeDesign and Fashion,PSGR Krishnammal College for Women,
Coimbatore

Abstract

As our population continues to grow and as the economy of developing countries is growing fast, demand for textiles will continue to grow. To meet this demand without sacrificing our health and the environment we live in, it is our responsibility to find sustainable textile solutions, Those sustainable solutions are introduced in the form of natural fibres and dyes in place of synthetic ones and improving the methods of processing so that they are harmless.In this study, an attempt has been made to develop an eco friendly product by selecting a natural & Regenerated yarn source of Modal &Cotton which is knitted into 50:50 blended fabrics. The natural dye source, Pterocarpus**santalinus** is one of the most valuable plant species ,Owing to the reddish colourof the heartwood of this plant, it is popularly known as 'Red sandalwood'. The natural dye source, Red sandal wood powder from the stem bark ofPterocarpus**santalinus** tree which is used for dyeing the fabric.

Keywords-Modal /Cotton ,Knitted Fabrics,Red Sandal wood,Alum

INTRODUCTION

Nature created us & also our surroundings. The environment is one of the most challenging problems facing the human race at present. So in order to safeguard our environment we must take some preventive measures and technologies that can maintain the balance of our eco system and makes the final product free from toxic effects. Sustainability as the balance between three elements: economy, environment and social equity[**4**]. The word „eco" is short for ecology. Ecology is the study of the interactions between organisms and their environment. Therefore „eco" friendly (or „ecology friendly") is a term to refer to goods and services considered to inflict minimal or no harm on the environment. "Think globally, act locally" is the slogan of tomorrow for the world textile industry**.[1]**

Luxurious things are more than just necessities [4]. Since ancient times, however, luxury has been associated with wealth, authority, and social standing. In [1], Christopher L. Berry argues in "The idea of Luxury" that luxury has evolved over time and is a reflection of societal standards and desires.

Textiles made with bast and leaf fibers are gaining huge importance from the sustainability perspective, and there are various plant resources used to create textiles out ofthem.Co**tton** is a **natural cellulosic fibre** derived from the seed hairs of the cotton plant (Gossypiumspecies[4]. It has been cultivated for thousands of years and remains one of the most important natural fibres in the textile industry. Cotton is known for its **softness**, **breathability**, and **ability to absorb moisture**, making it a preferred material for warm-weather clothing and everyday wear.

Modal is a **semi-synthetic fibre** made from **regenerated cellulose**, primarily sourced from beech tree pulp. It belongs to the **rayon** family but is distinguished by its **enhanced strength**, **silky texture**, and **superior moisture-wicking properties**[6].Together, cotton and modal fibresoffer a wide range of functional and aesthetic benefits, making them essential materials in the design of modern textiles.

II. MATERIALS AND METHODS

A.DEVELOPMENT OF FABRIC

The knitted Lotus / bamboo(50:50) blended fabrics were made using 40s (Nm) spun Lotus and Bamboo yarn.All fabrics were made using four track Mayer &Cie knitting machine.The machine specifications are mentioned in Table 1 and the cam order mentioned in the figure 1.

TABLE-1

S.No	Machine Details	Machine Specifications
1.	Machine Type /Fabric	Machine –Mayer & Cie,MV4-3.2 II/single Jersey& Pique
2.	Dia of Knitted machine	28''
3.	Machine Gauge	28gg
4.	No of Feeders	90
5.	Total No of needles	2464
6.	Machine Model	MV4-3.2 II
7.	Number of Needles /Gauge	88

B.DYEING OF COTTON/MODAL BLENDED FABRICS

SELECTION OF NATURAL DYES

Red sandal wood (Pterocarpiussantalinus) which is strong naturally occurring colourof reddish brown were selected for the study.

SELECTION OF MORDANTS

Alum were selected for the study.

EXTRACTION OF DYE SOLUTION

Commercially available Red Sandalwood powderwas bought and mixed with alum, add the 1:10 ratio of water and allows for heating to break the dye molecules mix into a fine dye solution. Then the dye solution was filtered and pure colouring agent was obtained for dyeing.

DYEING PROCEDURE

The selected samples were dyed in a conventional dyeing method with 60 degree for 1 hour. After the samples were taken out, rinsed thoroughly and allow for dry completely.

FIG-4 FIG-5

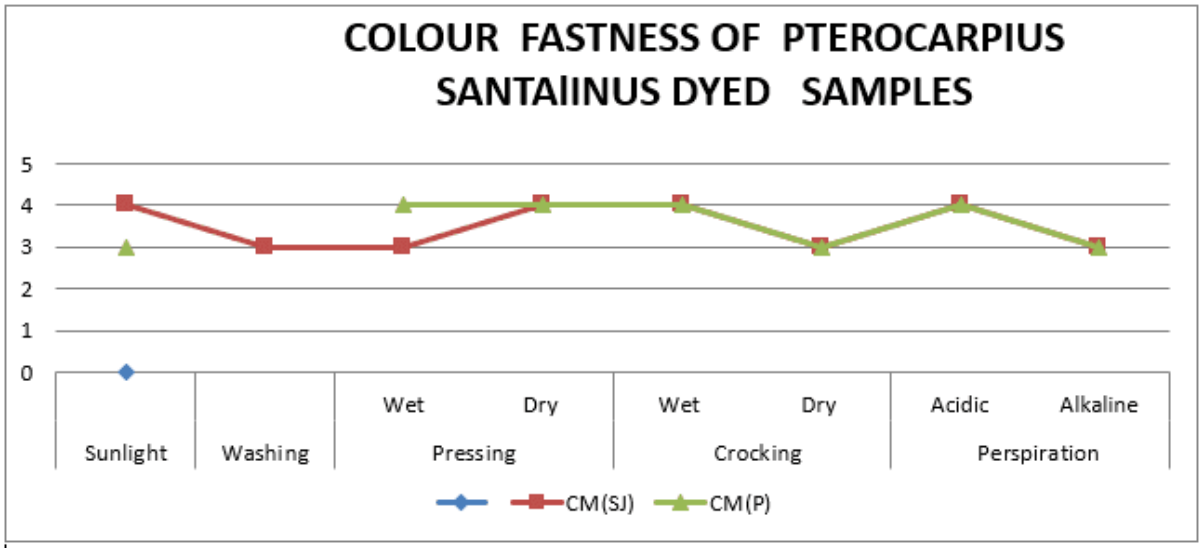
DYEING PARAMETERS

The Knitted fabrics were dyed with optimized parmaters on the given Table-2 and followed by the colour fastness test.

TABLE-2

S No	Material	Dyes	Mordant/%	Mordanting Techniques	Fabric	Material Liquor Ratio	Time/ Temperature	Dye concentration (5%)
1.	Cotton/Modal 50:50 Single - Jersey	Red sandal wood Powder	Alum-1%	SM	1 Metre	1:10	1 hour	5
2.	Lotus/Bamboo50:50-Pique	Red sandal wood	Alum-1%	SM	1 Metre	1:10	1 hour	5

3. RESULTS AND DISCUSSION



COLOUR FASTNESS TEST OF THE DYED SAMPLES-COTTON/MODAL USING (ISO GREY SCALE)

S.No	Sample	Sun Light	Washing (40)	Pressing		Crocking		Perspiration	
		T		Wet	Dry	Wet	Dry	Acidic	Alkaline
1.	CM(SJ)	4	3/5	4/5	4	4	3/4	4	3/5
2.	CM(P)	3	4	4	4	4	3/5	4	3/5

1-Very Poor ½-2-Poor 2/3-3-Moderate ¾ -Fair 4-Good 4/5 –Very Good 5-Excellent

CM-Cotton/Modal(Single Jersey) CM-Cotton/Modal(Pique)

FIGURE-1

4. CONCLUSION

From this study, colour fastness test of Cotton /Modal knitted Fabrics , single jersey has a better fastness to sunlight and perspiration test than pique fabrics. The results for crocking and

pressing pique has a high fastness than single jersey due to its intricate structure composition. Percentage when compared to Pique fabrics. The overall study shows the dye has a better colour strength after completed 5 was cycles.

INNOVATIONS IN TECHNICAL TEXTILES: SUSTAINABLE, SMART, AND HIGH-PERFORMANCE FABRICS

Mrs.A.Deepika Priya
Research Scholar, Department of Costume Design and Fashion, PSG College of Arts and Science, Coimbatore

Abstract

Technical textiles, or engineered fabrics made for practical rather than decorative uses, are revolutionising a variety of industries, including energy, transportation, healthcare, and defence. Three main themes have emerged in recent years: high-performance fabrics (ballistic/thermal protection, composite reinforcements, breathable/waterproof membranes), smart textiles (e-textiles, sensor-integrated apparel, self-powered systems), and sustainability (bio-based fibres, circular design, low-impact processing). This article examines the primary issues (scalability, durability, standards, and lifecycle evaluation), application fields, manufacturing techniques, performance testing, and technical advancements. It ends with research directions and opportunities that could speed up the development of a high-performance, intelligent, and sustainable textile ecosystem.

Introduction

Textiles produced primarily for their functional qualities (filtering, thermal protection, reinforcing, sensing, energy harvesting, etc.) as opposed to their aesthetic value are referred to as technical textiles. Technical textiles have been one of the fastest-growing sectors of the global textile industry over the last 20 years, making up a sizable and rising portion of global fibre production and consumption. Cross-sector demand (medical devices, automotive, aerospace, protective apparel) and the quick development of smart features integrated at the fibre, yarn, or fabric level are the main drivers of this rise.[1]

This assessment looks at manufacturing, testing, applications, and future directions after grouping innovations into three interrelated axes: high-performance fabric technologies, smart/electronic textiles, and sustainable approaches.

1. Sustainable innovations in technical textiles

1.1 Materials: bio-based & recycled fibers

When feasible, bio-based feed stocks (cellulosic fibres from lignocellulose, regenerated cellulose substitutes), biodegradable polymers, and recycled polymer streams (recycled PET) for technical applications have been adopted by industry and researchers due to sustainability efforts. Although comprehensive lifecycle evaluations and functional parity are still current issues, recent reviews emphasise the potential of lignocellulosic and other renewable materials for radiative heat regulation, moisture management, and composite matrices. [2]

1.2 Low-impact processing & finishing

Chemical and water footprints are decreased by solvent-free coating techniques, enzymatic pretreatments, plasma surface modification, and waterless colouring. Functionalisation (antimicrobial, hydrophobicity, conductivity) can be achieved without the use of bulky chemical baths thanks to techniques like plasma treatment, which is appealing for high-value applications and technical textile batches.

1.3 Circularity and end-of-life

Emerging technologies include textile-to-textile recycling, mono-material construction (to facilitate recycling), and design-for-disassembly. Maintaining good performance while allowing for recyclable or biodegradable end-of-life choices is a difficult for many technical textiles.

2. Smart textiles and e-textiles

2.1 Definitions and architectures

"Smart textiles" include very-smart (context-aware, adaptive), active (sensing, actuation), and passive (functional fibres and finishes) systems. E-textiles can be knit, woven, or coated, or they can be embedded directly into yarns or fabrics with conductive pathways, sensors, actuators, power, and communication modules. Reviews provide an overview of communication layers, sensor layouts, and methods for incorporating electronics into textile substrates. [3]

2.2 Self-powered and energy-harvesting textiles

Triboelectric nanogenerators, piezoelectric fibres, thermoelectric elements, and electromagnetic scavenging techniques are some of the major current trends in textile energy harvesting that are leading to self-powered wearable systems that minimise or do away with large batteries. In-depth analyses of self-powered smart textiles describe the components, production processes, and examples of applications (such as lighting, health monitoring, and human-machine interfaces).4]

2.3 Manufacturing techniques

Scalable embedding of sensors and interconnects is made possible by automated digital knitting or weaving, conductive yarn spinning, inkjet and screen printing of functional inks, and embroidered interconnects. Improvements in machine embedding and industrial knitting/knit-electronics are speeding up prototyping and increasing reproducibility.

2.4 Durability & washability

The durability of electronic textiles under mechanical deformation, frequent washings, and exposure to perspiration is a recurring weakness. Robust connector designs, conductive polymer coatings, and encapsulation techniques are proactive ways to increase service life without sacrificing textile comfort.

3. High-performance fabrics: protective & structural textiles

3.1 Protective textiles (ballistic, flame, thermal)

High-modulus fibres (aramid, UHMWPE, high-tenacity polyamides) and engineered fabric architectures (multilayer composites, woven or nonwoven reinforcements) are essential components of high-performance textiles used in industrial safety, firefighting, and military applications. Developments in hybridization—the blending offibres, coatings, and nanomaterial enhancements—improve multi-hazard protection, decrease weight, and boost energy absorption.

3.2 Textiles for composites & lightweight structures

Technical textiles, such as 3D fabrics and woven/stitched reinforcements, are frequently utilised as reinforcement preforms in polymer, metal, and ceramic matrix composites for structural elements in automobiles and aeroplanes. High stiffness-to-weight and strength-to-weight ratios, which are necessary for contemporary transportation applications, are made possible by customisingfibre orientation and fabric topology during manufacturing. [5]

3.3 Functional membranes: breathable/waterproof& thermoregulating fabrics

Recent research on radiative cooling textiles and phase-change materials offers active/passive microclimate control for personal thermal management, while membranes and coated fabrics that strike a compromise between moisture vapour transmission and liquid barrier qualities are still getting better. [2]

4. Yarn and fabric engineering for functionality

Yarn engineering plays an important role since it enables direct functionality translation from fibre to yarn to fabric through the use of conductive and shape-memory yarns, co-spun composite yarns, and filaments impregnated with nanomaterials. Technical textile-specific yarn technologies, such as electroconductive yarns, high-tenacity filaments, and biodegradable sewing threads, are covered in detail in textbooks and edited volumes. [6]

5. Testing, standards, and certification

Standardised performance testing is necessary for adoption in safety-critical industries (ballistic resistance, flame propagation, breathability, sustained sensor accuracy). Regulators and standards organisations are starting to release suggested protocols, but the harmonisationof test procedures for e-textiles (washability, electrical safety, and electromagnetic compatibility) is still in its infancy.

6. Applications

Healthcare: textile electrodes for ECG/EMG, wound dressings with antimicrobial/controlled release, wearable monitoring garments. [7]

Defense & public safety: lightweight ballistic vests, blast-mitigating liners, chemical-resistant suits. [5]

Transport & infrastructure: composite reinforcements in aircraft/automotive, geotextiles for civil engineering. [5]

Sports & consumer wearables: performance fabrics with moisture management, integrated sensors for biometric feedback. [3]

7. Challenges and research needs

Scalability & cost: many lab-scale smart materials remain expensive to scale.

Longevity: meeting textile service-life expectations under repeated mechanical, chemical and environmental stress.

Interoperability & standards: unified test protocols and interconnect standards for e-textile modules.

Environmental impact: ensuring recyclability (especially for multi-material e-textiles) and responsible recycling streams for electronics-containing garments.

User acceptance & ergonomics: achieving comfort, washability, and unobtrusive form factors.

Conclusion

Technical textiles sit at the nexus of material science, textile engineering, electronics, and sustainability. The coming decade is likely to see rapid maturation of self-powered e-textiles, wider adoption of bio-based and recyclable materials in high-value technical applications, and deeper integration of textile reinforcements in structural composites. Addressing durability, standards, and lifecycle impact will be crucial to turning laboratory innovations into societally beneficial, widely adopted products.

ARTIFICIAL INTELLIGENCE IN FASHION ILLUSTRATION AND FASHION PORTFOLIO MAKING

Dr.S.Umamageshwari
Assistant Professor, Department of Fashion Designing, Faculty of Science and Humanities, SRM Institute of Science and Technology, Kattankulathur, Chennai
Dr.G.Manonmani
Assistant Professor, Department of Home Science (Specialization - Textiles and Clothing), Mother Teresa Women's University,Research and Extension Center, Madurai

Abstract
Artificial Intelligence (AI) is revolutionizing the fashion industry, particularly in the domains of fashion illustration and portfolio creation. AI-powered tools enhance creativity, streamline workflows, and improve accuracy, providing designers with new ways to visualize and present their ideas. This paper explores the integration of AI in fashion drawing and portfolio making, examining its merits, challenges, and potential future developments. The study also highlights practical applications, ethical considerations, and the evolving role of designers in an AI-driven fashion landscape. . Additionally, ethical considerations and challenges associated with AI adoption in the creative fashion domain are examined, providing a comprehensive perspective on the evolving role of technology in design.
Keywords: Fashion, Creative, Applications, Art value, Technology, Portfolio

Introduction

The fashion industry has always been a fusion of art, creativity, and technology. Traditionally, fashion illustration and portfolio creation were manual processes requiring significant time and artistic skill. With the advent of Artificial Intelligence (AI), designers now have access to tools that can generate illustrations, suggest design variations, and streamline the creation of professional portfolios.

AI applications in fashion are not just limited to automation; they also provide insights, predictive capabilities, and enhanced visualization options. This paper aims to investigate the role of AI in fashion illustration and portfolio making, discussing its benefits, challenges, and future possibilities. The intersection of technology and fashion has always presented opportunities for innovation, yet the advent of Artificial Intelligence marks a significant milestone in this evolution.

Traditionally, fashion illustration involved hand-drawn sketches that required precision, creativity, and substantial time investment. Similarly, fashion portfolios, which serve as essential tools for presenting a designer's work, demanded meticulous organization and aesthetic consideration. AI-powered tools now facilitate these processes by offering capabilities such as automated sketch generation, pattern recognition, and intelligent layout design. These advancements do not replace human creativity but augment it, enabling designers to explore more ideas, iterate rapidly, and present their concepts more effectively.

AI in Fashion Illustration

AI in fashion illustration involves using machine learning algorithms, computer vision, and generative AI tools to create or enhance design sketches. These tools can replicate styles, generate multiple design options, and assist designers in refining their ideas. AI applications in fashion illustration have introduced a paradigm shift in how designers approach the creative process. By employing machine learning algorithms and generative AI technologies, designers can create detailed illustrations with greater efficiency and flexibility. AI tools analyze existing design styles and patterns, learning from them to generate new variations that align with the designer's vision. This process enhances creativity, as designers are exposed to possibilities they may not have considered manually. Additionally, AI ensures accuracy in proportions, color combinations, and pattern placement, which is particularly useful for novice designers or for high-volume production contexts. By automating repetitive tasks, AI allows designers to dedicate more time to conceptual innovation and artistic exploration.

The merits of AI in fashion drawing are manifold. AI accelerates the illustration process, reducing the time required to produce high-quality sketches while maintaining precision. It fosters creativity by providing design suggestions, enabling the exploration of multiple variations in a fraction of the time it would take manually. Moreover, AI systems can adapt to individual designer preferences, creating a

personalized collaborative environment where human creativity and computational intelligence complement each other. The integration of AI also supports collaboration, as teams can work on designs simultaneously with AI-generated enhancements.

Fig:AI in Fashion

AI in Fashion Portfolio Making

Fashion portfolio serve as the primary medium for designers to communicate their skills, ideas, and creativity to potential clients, employers, or collaborators. AI has significantly streamlined the portfolio creation process by automating layout designs, curating content, and optimizing visual presentations. Advanced AI systems can analyze the designer's body of work and recommend the most effective sequence, organization, and visual emphasis, thereby enhancing the impact of the portfolio. Furthermore, AI-powered tools enable interactive and multimedia integration, allowing designers to incorporate 3D renderings, animations, and virtual showcases within their portfolios.

The advantages of AI in portfolio making are profound. Designers benefit from reduced manual effort, as AI assists in arranging images, text, and other elements aesthetically. The customization capability ensures that portfolios can be tailored to specific audiences or job applications, increasing their effectiveness.

AI also enables data-driven insights by analyzing viewer engagement and suggesting modifications to enhance the presentation. By integrating AI-generated illustrations directly into the portfolio, designers can create cohesive, professional, and visually compelling narratives that reflect both technical skill and artistic vision.

Fig: 2 Artificial Intelligence in Fashion Portfolio

Future of AI in Fashion

The future of AI in fashion holds immense potential, extending beyond illustration and portfolio creation. Collaborative AI design is expected to become more prevalent, with systems capable of co-creating alongside designers to push the boundaries of creativity. AI will also facilitate personalized fashion, allowing designs to be customized to individual consumer preferences, enhancing both satisfaction and market relevance. Sustainability is another key area where AI will play a critical role,

optimizing material usage, reducing waste, and predicting trends to prevent overproduction. Moreover, the integration of AI with virtual and augmented reality technologies will provide immersive experiences, enabling digital fashion shows, virtual try-ons, and dynamic portfolio presentations.

Fig:3 Applications of AI in Textile Industry

Challenges and Ethical Considerations

Despite its numerous benefits, the adoption of AI in fashion also presents several challenges. One concern is the potential reduction in human originality, as over-reliance on AI-generated suggestions might constrain creative diversity. Intellectual property issues also arise, particularly regarding the ownership of AI-generated designs. Accessibility remains a challenge, as smaller designers may lack resources to utilize advanced AI tools effectively. Furthermore, biases in AI algorithms, stemming from limited or skewed training data, may inadvertently influence design suggestions, raising ethical considerations that the industry must address.

Conclusion

Artificial Intelligence has fundamentally transformed the processes of fashion illustration and portfolio creation, enhancing efficiency, creativity, and personalization. While AI presents challenges such as ethical concerns and accessibility, its integration offers unparalleled opportunities for innovation. Designers who embrace AI as a collaborative partner can expand the boundaries of creative expression, improve workflow efficiency, and present their work more effectively. As technology continues to evolve, the synergy between human creativity and AI intelligence promises a future where fashion design is more dynamic, inclusive, and sustainable.

INTEGRATION OF BIOSENSORS INTO COMPRESSION GARMENTS FOR CHRONIC DISEASE MANAGEMENT

Ms. R. Dharani
School of Fashion, Assistant Professor, A.V.P. College of Arts and Science, Tirupur,Tamilnadu. India.
Ms. P. Selvi
Department of Costume Design and Fashion, Head & Assistant Professor, Nandha Arts and Science College (Autonomous), Erode. Tamilnadu. India.

Abstract

Chronic diseases such as cardiovascular disorders, diabetes, and venous insufficiencies pose long-term health challenges requiring continuous monitoring and management. The integration of biosensors into compression garments represents a promising approach to enhance remote healthcare delivery, enabling real-time physiological data acquisition while ensuring therapeutic benefits through compression. This paper reviews recent advancements in smart textile technologies, biosensor integration techniques, and data communication systems embedded in compression garments. It further evaluates the potential of such systems in chronic disease monitoring and outlines the challenges regarding sensor placement, power consumption, data security, and user comfort. Experimental insights and use-case scenarios are also discussed, highlighting future directions in wearable healthcare solutions.
Keywords: Smart textiles, biosensors, compression garments, chronic disease management, wearable health monitoring, remote patient care, e-textiles, telemedicine.

1. Introduction

Chronic diseases are among the leading causes of morbidity and mortality globally. According to the World Health Organization, chronic illnesses such as diabetes, cardiovascular diseases, and chronic respiratory conditions account for approximately 71% of all deaths worldwide. Effective management of these conditions often demands continuous health monitoring, timely intervention, and long-term lifestyle modification.

Traditional health monitoring approaches involve periodic hospital visits and bulky monitoring devices, which can be inconvenient and reduce patient adherence. Smart wearable technologies, particularly biosensor-integrated compression garments, offer a novel solution. These garments combine therapeutic compression therapy with integrated biosensing capabilities, allowing real-time monitoring of vital parameters such as heart rate, blood glucose levels, oxygen saturation, and skin temperature. This paper explores the development, integration, and potential applications of biosensors within compression garments for chronic disease management.

2. Background and Literature Review

2.1. Compression Garments in Medicine

Compression therapy is widely used in treating venous disorders, lymphedema, and post-operative recovery. Compression garments exert controlled pressure on limbs or specific body parts to improve blood flow, reduce swelling, and prevent blood clots. These garments are usually made from elastic textiles with graduated compression profiles.

2.2. Biosensors in Wearables

Biosensors are analytical devices capable of detecting biological signals and converting them into measurable electrical outputs. In wearable health systems, biosensors typically monitor:

- Cardiovascular metrics (e.g., ECG, pulse rate)
- Metabolic markers (e.g., glucose, lactate)
- Respiratory activity
- Hydration and electrolyte balance

Flexible, stretchable biosensors that conform to the skin are crucial for wearable applications. Materials such as conductive polymers, graphene, and textile-based conductive fibers are commonly used.

2.3. Existing Smart Textiles and Garment Integration

Recent developments in e-textiles have enabled the embedding of sensors directly into fabrics through weaving, knitting, or printing conductive materials. Several prototypes and commercial solutions have demonstrated wearable ECG shirts, pressure-sensing socks, and temperature-regulating smart clothes. However, the integration of multiple biosensors within compression garments remains an emerging domain with limited large-scale implementations.

3. System Architecture

A typical biosensor-integrated compression garment includes the following components:

- **Sensor Modules**: ECG electrodes, temperature sensors, photoplethysmography (PPG) units, and biochemical sensors (e.g., for sweat analysis).
- **Data Processing Unit**: Microcontrollers for signal processing and filtering.
- **Wireless Communication**: Bluetooth Low Energy (BLE) or Zigbee modules for data transmission to mobile apps or cloud servers.
- **Power Supply**: Rechargeable batteries or energy-harvesting systems.
- **User Interface**: Companion mobile or web applications for data visualization and alerts.

The garment is designed to be washable, breathable, and non-irritating, ensuring both therapeutic compression and sensor functionality.

4. Applications in Chronic Disease Management

4.1. Cardiovascular Diseases

Compression garments with integrated ECG and PPG sensors can continuously monitor heart rate variability, detect arrhythmias, and provide early warnings of cardiac events. This is particularly useful for patients at risk of heart failure or stroke.

4.2. Diabetes Monitoring

Non-invasive glucose monitoring using sweat analysis or interstitial fluid sensors is under active development. Combined with compression therapy for diabetic foot management, such garments could offer comprehensive solutions.

4.3. Venous Insufficiency and Lymphedema

Smart compression garments can dynamically adjust pressure based on swelling levels, track compliance, and monitor skin temperature to detect inflammation or infection.

5. Challenges and Considerations

5.1. Sensor Accuracy and Calibration

Sensor performance can degrade over time due to sweat, movement, or repeated washing. Ensuring consistent accuracy requires robust sensor calibration and validation protocols.

5.2. Power Management

Power consumption must be minimized for prolonged use. Energy-efficient communication protocols and battery optimization are essential.

5.3. Data Privacy and Security

Health data is sensitive and requires end-to-end encryption, secure cloud storage, and compliance with medical data regulations like HIPAA and GDPR.

5.4. Comfort and Usability

User compliance depends on comfort, garment aesthetics, and ease of use. Stretchable, soft, and breathable materials must be used without compromising sensor integrity.

6. Experimental Prototype and Case Study

A prototype compression sleeve was developed using knitted fabric with integrated ECG electrodes and a skin temperature sensor. The signals were transmitted via BLE to a smartphone app. In a small clinical study (n=10), subjects wore the garment for 8 hours daily over 7 days. The system successfully recorded vital data with over 92% signal reliability. Users reported minimal discomfort, and the data correlated well with standard clinical devices.

7. Conclusion

The integration of biosensors into compression garments represents a significant step forward in the evolution of personalized, continuous healthcare. Such systems can transform chronic disease management by enabling early diagnosis, remote monitoring, and improved patient compliance. While challenges related to power, accuracy, and usability remain, ongoing advances in material science, textile engineering, and biomedical sensors are rapidly closing

these gaps. Future research should focus on large-scale clinical validation, battery-free systems, and AI-driven health analytics for predictive diagnostics.

FABRICATING SERENITY: AN OVERVIEW OF ACOUSTIC TEXTILE TECHNOLOGY

C.Catherine Mary Sharmila
Assistant Professor & Head Department of Costume Design and Fashion
A.V.P. College of Arts and Science (Co-edu), Tirupur

Abstract

The growing significance of acoustic textiles in modern-day architecture, interior design, and noise control can be seen in everyday. With increasing urbanization, the issue of noise pollution in residential, commercial, and industrial spaces has become a critical concern. Traditional noise-control methods often rely on heavy, rigid, and aesthetically unappealing materials. Acoustic textiles, which are fabrics engineered to absorb sound waves, offer a lightweight, flexible, and visually appealing alternative. For instance, in open-plan offices, acoustic textiles in the form of curtains, wall panels, and upholstered furniture can create a more productive and less distracting environment. In concert halls and theaters, they are essential for optimizing sound quality by controlling unwanted reflections. Based on the sustainable aspects, using recycled and bio-based fibres in the production of acoustic textiles, aligning with a global push towards eco-friendly building materials have reached new heights. Ultimately, this paper aims to demonstrate that acoustic textiles are more than just a functional solution; they are a transformative element that seamlessly integrates noise control with aesthetic design, proving their indispensable role in shaping comfortable and sustainable modern spaces. We will discuss the fundamental principles of sound absorption and how the unique structure of these textiles—including their porosity, density, and thickness—allows them to effectively mitigate echoes and reduce reverberation time. Furthermore, the paper will highlight the innovative applications of these materials in diverse settings.

Keywords: Acoustic Textiles, Sound Absorption, Noise Control, Interior Design, Sustainable Materials, Architecture, Reverberation, Textiles.

1. Introduction

The rapid pace of global urbanization has led to a significant increase in population density and, consequently, a rise in environmental noise. Noise pollution, defined as excessive or unwanted sound, is no longer a minor nuisance but a critical public health and environmental issue. It is known to have adverse effects on human well-being, contributing to stress, hearing impairment, and reduced productivity. While traditional sound-control measures, such as heavy insulation and rigid panels, have long been employed, they often lack aesthetic versatility and sustainable credentials. This paper explores the emerging and transformative role of acoustic textiles as a modern, effective, and visually appealing solution to noise control. We will discuss their fundamental principles, innovative applications, and the growing emphasis on sustainable materials, demonstrating their indispensable contribution to the creation of comfortable and aesthetically pleasing modern spaces.

2. Principles of Sound Absorption by Textiles

Sound absorption is the process by which sound energy is converted into another form of energy, typically heat, when it comes into contact with a material. Acoustic textiles, which are porous fibrous materials, achieve this through two primary mechanisms:

- **Viscous Loss:** As sound waves propagate through the air within the fibrous structure of the textile, the air molecules oscillate and rub against the fibers. This friction converts a portion of the sound energy into heat.

- **Thermal Loss:** The rapid compression and expansion of air pockets within the material's pores lead to temperature fluctuations. These thermal changes, in turn, dissipate sound energy.

The effectiveness of an acoustic textile is quantified by its Sound Absorption Coefficient **(α)**, which ranges from 0 (no absorption) to 1 (complete absorption). Some of the key properties of the textile that influence its performance include:

- **Porosity:** The ratio of the void volume to the total volume of the material. A higher porosity allows for greater air movement and, thus, more viscous and thermal losses.
- **Airflow Resistance:** A measure of the opposition to the flow of air through the material. An optimal airflow resistance is crucial; if it is too low, sound waves pass through without much interaction, and if it is too high, the material acts as a sound reflector.
- **Thickness and Density:** Increasing the thickness of the textile generally improves low-frequency sound absorption. The density and arrangement of fibers also play a vital role in determining the material's overall acoustic performance.

3. Applications of Acoustic Textiles

Acoustic textiles are no longer confined to specialized acoustic environments. Their versatility allows for widespread use in a variety of settings:

- **Commercial and Office Spaces:** The rise of open-plan office layouts, while promoting collaboration, often exacerbates noise issues. Acoustic textiles in the form of suspended baffles, upholstered furniture, acoustic curtains, and modular wall panels are used to create "quiet zones" and reduce speech intelligibility, thereby enhancing concentration and productivity.
- **Public Spaces and Hospitality:** In hotels, restaurants, and airports, acoustic textiles help to manage the noise from large crowds. Curtains and carpets can significantly reduce reverberation time, making these spaces more comfortable and less overwhelming for visitors.
- **Residential and Healthcare Environments:** Within homes, acoustic fabrics can be used for curtains, rugs, and wall hangings to improve room acoustics and create a more serene living environment. In hospitals, controlling noise is critical for patient recovery. Acoustic textiles contribute to a quieter atmosphere that minimizes stress and promotes healing.
- **Entertainment and Performance Venues:** In concert halls, theaters, and recording studios, precise sound control is paramount. Acoustic textiles are strategically placed on walls and ceilings to absorb specific frequencies, optimizing the auditory experience for the audience and performers.

4. The Move towards Sustainable Acoustic Textiles

The modern era is marked by a growing global consciousness regarding environmental sustainability. The textile industry is responding by developing acoustic solutions from eco-friendly and recycled materials.

- **Natural Fibers:** Materials like wool, cotton, and hemp are inherently porous and possess excellent sound-absorbing properties. Their biodegradability and renewable nature make them a preferred choice for sustainable design.
- **Recycled Materials:** The use of recycled polyester (rPET) derived from plastic bottles is a prominent example. These fibers can be processed into non-woven felts or woven fabrics with high acoustic performance, reducing plastic waste and conserving resources.

- **Bio-based and Novel Fibers:** Researchers are exploring the use of innovative bio-based materials, such as those derived from agricultural waste, to create high-performance acoustic absorbers. This research area holds great promise for the future of sustainable acoustics.

5. Innovative Applications of Acoustic Textiles

Acoustic textiles are moving beyond traditional applications like wall panels and curtains to become a key component in a wide range of innovative fields. Their ability to control sound, combined with advancements in material science, has opened up exciting new possibilities.

Here are some of the most innovative applications of acoustic textiles:

Smart and Interactive Textiles

This is a rapidly evolving area where acoustic textiles are no longer just passive sound absorbers. Researchers are developing fabrics that can actively interact with sound.

- **Acoustic Sensing and Monitoring:** Fabrics are being engineered with special fibers that can function as tiny microphones. These "acoustic fibers" can detect and convert sound vibrations into electrical signals. This technology has groundbreaking applications:
    - **Healthcare:** A shirt woven with acoustic fibers could monitor a patient's breathing, heartbeat, or even detect a cough, alerting healthcare providers to potential issues. This could be particularly useful for monitoring asthma patients or for remote health tracking.
    - **Wearable Technology:** A jacket could act as an ear, helping a hearing-impaired person navigate a noisy environment by detecting sounds like a car horn or a siren and translating them into a tactile or visual alert.
    - **Structural Health Monitoring:** Acoustic textiles could be embedded into the skin of a spacecraft or a building to detect cracks, strains, or accumulating dust by listening for subtle acoustic changes.

Sound Generation: The same principles that allow fabrics to "hear" can also be reversed. Scientists are exploring ways to create textiles that can generate sound, potentially turning clothing into a communication device or a speaker.

Architectural and Interior Design

Beyond standard acoustic panels, designers are leveraging the flexibility of textiles to create dynamic and aesthetically striking solutions.

- **Flexible Room Zoning:** In open-plan offices, restaurants, and public spaces, acoustic textiles are used in the form of flexible curtain systems or movable fabric partitions. These can be easily drawn to create temporary, quiet zones for meetings or individual work, and then retracted to open up the space again.
- **3D and Sculptural Installations:** Designers are using acoustic textiles to create stunning three-dimensional forms on walls and ceilings. These sculptural installations not only serve as a visual centerpiece but also dramatically improve a room's acoustics by diffusing and absorbing sound from multiple angles.
- **Transparent Acoustic Fabrics:** An innovation that was once considered impossible, transparent acoustic textiles allow natural light to pass through while still providing significant sound absorption. This is a game-changer for offices, museums, and homes that want to maintain an open, airy feel without the issue of excessive noise.

Transportation and Automotive

Noise reduction is a critical factor in the transportation industry, and acoustic textiles are at the forefront of this effort.

- **Lightweight Soundproofing:** Car manufacturers are using advanced acoustic textiles in door panels, headliners, and trunk liners to reduce engine, road, and wind noise. These materials are often lighter than traditional sound-damping materials, which helps improve fuel efficiency.
- **Enhanced In-Cabin Experience:** In luxury vehicles and aircraft, acoustic textiles are used to create a more serene and comfortable environment, improving speech intelligibility and the quality of the in-cabin entertainment system.

Healthcare and Wellness Environments

Noise can be a major source of stress and a barrier to healing in healthcare settings.

- **Calming and Therapeutic Spaces:** Acoustic textiles are being used in hospital rooms, waiting areas, and rehabilitation centers to create a quieter, more soothing atmosphere for patients and staff.
- **Privacy and Speech Intelligibility:** In clinics and doctors' offices, acoustic drapes and panels can be used to ensure patient privacy by preventing conversations from being overheard in adjacent rooms.

Fashion and Apparel

While still an emerging field, acoustic textiles are starting to find their way into fashion.

- **Functional Clothing:** Designers are experimenting with sound-absorbing materials to create clothing that can help reduce noise exposure for individuals working in loud environments, like factory workers or construction crews.
- **Fashionable Acoustic Accessories:** The line between fashion and function is blurring with the creation of items like sound-dampening scarves or wearable accessories designed to mitigate urban noise pollution.

The common thread in all these innovative applications is the move from simple noise absorption to a more integrated, functional, and aesthetically-driven approach to sound management.

6. Conclusion

Acoustic textiles represent a paradigm shift in how we approach noise control in the built environment. By combining functional sound absorption with a vast range of aesthetic possibilities, they offer a superior alternative to traditional materials. This paper has highlighted the scientific principles governing their performance, showcased their diverse applications, and underscored their alignment with global sustainability goals. The ability of acoustic textiles to seamlessly integrate into architectural and interior design makes them an essential tool for creating healthier, more comfortable, and more sustainable living and working spaces. As the demand for a quieter, more harmonious world continues to grow, acoustic textiles will undoubtedly play an increasingly vital role in shaping the modern era.

SUSTAINABLE FIBER-REINFORCED COMPOSITES: A NEW ERA OF LIGHTWEIGHT AND HIGH-STRENGTH TECHNICAL TEXTILES

Ms. R. Dharani
Ph.D Research Scholar, Department of Costume Design and Fashion, Kongunadu Arts and Science College, Coimbatore. Tamilnadu. India.
Dr.P. Sasikala
Associate Professor, Department of Costume Design and Fashion, Nirmala College for Women, Coimbatore, Tamilnadu. India

Abstract

The integration of fiber-reinforced composites (FRCs) into the realm of technical textiles has marked a significant shift towards sustainability in industries ranging from automotive to aerospace and construction. This paper explores the role of sustainable FRCs in revolutionizing the production of lightweight, high-strength materials while minimizing environmental impact. By examining key advancements in the choice of fibers, matrices, and manufacturing techniques, the paper highlights the potential for sustainable FRCs to reduce material waste, enhance recyclability, and lower energy consumption. The paper also addresses the challenges in scaling up these materials for commercial applications, such as cost, performance consistency, and material lifecycle. Case studies from various sectors demonstrate how the adoption of these materials can drive the transition toward more sustainable manufacturing processes. Finally, future trends and research directions are discussed, offering insights into the continued evolution of fiber-reinforced composites in technical textiles.

Keywords: Sustainable composites, fiber-reinforced composites, technical textiles, lightweight materials, high-strength textiles, sustainability, renewable fibers, green manufacturing, recyclability, environmental impact.

1. Introduction

The increasing demand for lightweight, high-performance materials in various industries has driven significant advancements in the development of fiber-reinforced composites (FRCs). FRCs are widely used due to their remarkable strength-to-weight ratio, durability, and versatility in design. Traditional FRCs typically rely on synthetic fibers such as glass and carbon, embedded in epoxy or polyester matrices. However, these materials pose substantial environmental challenges due to their non-renewable nature, high energy consumption during production, and poor end-of-life recyclability.

In response to these challenges, the focus has shifted towards sustainable alternatives, which integrate renewable and bio-based fibers, eco-friendly matrices, and manufacturing methods that prioritize energy efficiency and waste reduction. This paper explores how sustainable FRCs are transforming the technical textile industry and outlines the key factors influencing their performance, adoption, and future potential.

2. Composition of Sustainable Fiber-Reinforced Composites

2.1 Fiber Types: Renewables and Bio-based Fibers

The choice of fiber is crucial to the sustainability of the composite. Traditionally, fibers such as glass, carbon, and aramid have been dominant, but these are energy-intensive to produce and have limited recyclability. Emerging sustainable fibers, such as natural fibers (flax, hemp, jute, sisal) and bio-based synthetic fibers (PLA, PHA), are gaining attention due to their lower environmental impact, renewability, and biodegradability. Natural fibers offer good mechanical properties and low density, making them suitable for applications in automotive interiors, packaging, and lightweight construction materials.

Moreover, advances in hybrid composites, where natural fibers are combined with synthetic fibers or bio-based matrices, offer an optimized balance of sustainability and performance.

2.2 Matrices: Eco-Friendly Resins and Binders

The matrix material plays a crucial role in bonding the fibers and imparting structural integrity to the composite. Traditionally, petrochemical-based resins such as epoxy, vinyl ester, and polyester have been used, but their environmental drawbacks are significant. To address these concerns, research into eco-friendly alternatives has accelerated, with bio-based resins derived from vegetable oils, soy, and other renewable resources becoming viable alternatives. Additionally, thermoplastic matrices, which can be more easily recycled and reused, are increasingly being explored for their sustainability advantages.

2.3 Manufacturing Techniques: Energy Efficiency and Waste Reduction

Sustainable FRC production involves minimizing energy consumption and material waste. Traditional manufacturing methods like hand lay-up or autoclave processing are energy-intensive and generate significant waste. In contrast, more sustainable methods such as resin transfer molding (RTM), compression molding, and additive manufacturing (3D printing) offer potential advantages in terms of energy efficiency, reduced material waste, and improved precision in fiber placement. These techniques not only help to conserve energy but also enable the production of more complex, lightweight structures, enhancing the performance of technical textiles.

3. Benefits of Sustainable Fiber-Reinforced Composites

3.1 Environmental Impact Reduction

Sustainable FRCs offer a significant reduction in the environmental footprint of technical textiles. Natural fibers, being renewable and biodegradable, contribute to lower carbon emissions during their lifecycle compared to synthetic alternatives. Furthermore, bio-based resins reduce reliance on fossil fuels and can lower emissions associated with manufacturing processes.

Recyclability is another key factor. While traditional composites often end up in landfills at the end of their life, the use of thermoplastic matrices and the development of more efficient recycling technologies ensure that FRCs can be reused or repurposed. The potential for closed-loop recycling in sustainable composites could further reduce waste and conserve resources.

3.2 Lightweight and High-Strength Properties

Sustainable FRCs maintain the key advantages of traditional composites, such as high strength and low weight. This makes them particularly valuable for industries where weight reduction is crucial for energy efficiency, such as the automotive, aerospace, and renewable energy sectors. The incorporation of renewable fibers does not compromise these properties and, in some cases, may enhance them by introducing unique mechanical advantages offered by hybrid fiber systems.

3.3 Economic and Social Impacts

The adoption of sustainable materials offers potential economic benefits, particularly in terms of reducing raw material costs and energy usage. Local sourcing of natural fibers can also stimulate regional economies, promoting job creation in rural areas. Additionally, the increased consumer demand for sustainable products drives companies toward adopting more eco-friendly practices, contributing to overall social and environmental welfare.

4. Challenges and Barriers to Adoption

Despite the promising potential of sustainable FRCs, several barriers hinder their widespread adoption. One of the primary challenges is cost. The production of bio-based fibers and resins is often more expensive than traditional petroleum-based materials, which limits

their competitiveness in cost-sensitive markets. Additionally, the performance consistency of bio-based composites may vary due to the natural variability of raw materials.

Another significant barrier is the lack of established recycling systems for composites, particularly those made from natural fibers. While thermoplastic-based composites are easier to recycle, thermoset composites, which are commonly used in technical textiles, remain difficult to process after use.

Lastly, there is still a need for standardized testing and performance metrics specific to sustainable FRCs. This would help to ensure that they meet industry-specific requirements for durability, strength, and safety.

5. Case Studies and Applications

Several industries have already begun incorporating sustainable FRCs into their technical textiles. In the automotive sector, manufacturers like BMW and Toyota are exploring natural fiber composites for interior components, aiming to reduce vehicle weight and increase sustainability without compromising safety or performance. In the aerospace industry, companies like Airbus are investigating bio-based composites for lightweight structural parts to improve fuel efficiency. Additionally, sustainable FRCs are being used in construction for reinforcement of eco-friendly building materials, such as hempcrete and bio-concrete.

6. **Conclusion**

The development of sustainable fiber-reinforced composites marks a significant step toward a greener future for technical textiles. By incorporating renewable fibers, eco-friendly resins, and energy-efficient manufacturing methods, these composites offer numerous benefits, including reduced environmental impact, enhanced recyclability, and high performance. However, challenges such as cost, material variability, and recycling infrastructure must be addressed to enable widespread adoption. Continued research, technological advancements, and collaboration between industries are essential to overcome these barriers and unlock the full potential of sustainable FRCs. The future of technical textiles lies in the integration of sustainability without compromising performance, and fiber-reinforced composites are at the forefront of this transformation.

Abstract
Technical textiles have developed into a new class of intelligent, high-performance materials that blend creativity and practicality, going well beyond simple fabrics. In addition to providing protection, these fabrics are made to react and adjust to certain situations and user requirements. Patient care is being enhanced by advancements in healthcare, including sensor-based clothing, implanted textiles, and sophisticated wound dressings. Lightweight bulletproof materials, fire-resistant apparel, and chemical-protection outfits that combine comfort and safety are examples of defense and protective applications. Smart fabrics with built-in sensors track performance, keep an eye on health, and improve endurance in sports and exercise. Even in daily life, they are used to enhance comfort and sustainability in furnishings, filtration systems, and construction materials. In addition to eco-friendly and biodegradable fibers, recent developments concentrate on nanotechnology coatings that offer antibacterial, UV-resistant, and water-repellent qualities. Technical textiles promise an active, solution-driven fabric future despite issues with cost and durability.
Keywords: Technical Textiles; Functional Textiles; Protective Clothing; Smart Textiles; Nanotechnology; Sustainability

Introduction:

The conventional function of fabrics has been redefined by technical textiles, which have become one of the textile industry's most dynamic and quickly growing divisions. They now represent a new generation of intelligent and high-performance materials that are no longer restricted to simple covering or protection and are able to react, adapt, and interact with a variety of environments and user needs. Lightweight bulletproof fabrics, fire-resistant clothing, and chemical-protective suits improve safety while preserving comfort in the defense and protection sector, while sensor-based clothing, implantable textiles, and sophisticated wound dressings are transforming patient care and diagnostics in the healthcare industry. Similar to this, smart textiles with embedded sensors help with endurance and performance tracking in sports and fitness. Beyond these industries, technical textiles are used in filtration systems, building materials, and home furnishings, all of which promote sustainability in daily life. Technical textiles have great potential as active, solution-focused materials of the future, propelled by nanotechnology, smart electronics, and environmentally friendly advancements.

Overview of Protective and Useful Technical Textiles:

Although the lines between protective and functional textiles often blur in contemporary applications, technical textiles can be broadly divided into two categories. Functional fabrics are made to give improved performance attributes in addition to traditional comfort and style. These include of heat regulation, antibacterial qualities, moisture control, and UV resistance. These textiles are used extensively in smart apparel, sporting, and medical fabrics, where they enhance performance, comfort, and health.

Conversely, protective textiles are designed primarily to protect users from harsh or dangerous surroundings. Their ability to withstand fire, chemicals, mechanical force, viruses, and even radiation makes them indispensable in fields including healthcare, industrial safety, and defense. Bulletproof textiles, chemical-resistant apparel, flame-retardant suits, and medical PPE are a few examples.
The line between protective and practical fabrics is becoming more and more hazy in modern practice. Numerous sophisticated textiles are made to serve two purposes at once; for example, breathable, light clothing that not only controls body temperature but also fends off environmental threats and microbiological growth. The increasing significance of multifunctionality in technological textiles is highlighted by this convergence.

Recent Innovations:
The demand for intelligent, sustainable, and multipurpose materials has fueled the rapid breakthroughs in the field of technical textiles. The future of protective and functional textiles is being shaped by a number of innovative developments:
Nanotechnology in Textiles: Nanoscale coatings greatly improve durability and cleanliness by imparting qualities like stain resistance, water repellence, antimicrobial resistance, and even self-cleaning capabilities.
Wearable and Smart Textiles: Fabrics with sensors and electrical components built in may measure vital indications like temperature, movement, and heart rate, allowing for real-time performance evaluation and health tracking.
High-Performance Fibers: Advanced fibers with exceptional resistance to heat, cutting, and ballistics, like aramid, carbon, and basalt, are essential for industrial safety, aerospace, and defense applications.
Sustainable Innovations: Recycled PET fibers, biodegradable safety gear, and environmentally friendly flame retardants are being developed to reduce ecological impact as environmental responsibility gains more attention.
Phase Change Materials (PCM): Adaptive textiles that contain PCM help athletes, mountaineers, and soldiers working in harsh conditions by regulating body temperature and providing comfort and protection.
Textiles that absorb vibration and sound in order to improve safety and comfort, engineered textiles that lessen noise and vibration are being used in automobiles, buildings, and industrial environments. jCollectively, these developments show how textiles are evolving into intelligent systems that play a variety of roles in business, healthcare, defense, and daily life.

Real-world Applications:
Technical textiles have shown to have a substantial impact on a variety of industries by providing useful solutions that go beyond the traditional use of fabrics.
Medical Care By providing controlled healing and infection monitoring, smart bandages with sensors and drug-release mechanisms are transforming wound care. Antiviral and antimicrobial personal protective equipment (PPE) was essential in protecting the public and medical personnel during the COVID-19 pandemic.
Security and Defense High-performance fibers used to make lightweight bulletproof jackets offer ballistic protection without sacrificing mobility. Military personnel's safety and invisibility in dangerous circumstances are being improved by advanced camouflage materials with thermal and infrared shielding.
Challenges and Future ScopeL:
Despite quick advancements, there are still a number of obstacles in the way of the broad use of protective and functional fabrics.

Cost and Scalability: The production of many modern textiles, especially those that use high-performance fibers or nanotechnology, is still expensive. For these inventions to be financially viable for larger markets, production must be scaled up without sacrificing quality.
Integration with AI and IoT: Although smart textiles are rapidly including sensors and connectivity features, it is still difficult to guarantee smooth integration with AI and the Internet of Things. One major challenge remains striking a balance between technical sophistication and user comfort, washability, and durability.
Sustainability: The sector needs to concentrate on cutting waste, energy use, and ecological footprint as environmental concerns grow. One of the main challenges is creating eco-friendly coatings, recyclable textiles, and biodegradable fibers without compromising functionality.
Prospects for the Future Multifunctionality and adaptability are key to the future of technical textiles. New developments anticipate textiles that can generate energy through solar or kinetic harvesting, self-heal, and react instantly to changes in their surroundings. These developments will change how people interact with textiles, turning them from passive materials into intelligent, active systems.

Conclusion:
A paradigm shift in the function of fabrics has occurred with the development of technology textiles, which turn them from passive coverings into intelligent, active systems. A new era of performance-driven solutions is being shaped by functional and protective textiles that combine nanotechnology, high-performance fibers, smart electronics, and sustainable advances. Their use in sports, healthcare, defense, and environmental management demonstrates their ability to improve sustainability, comfort, and safety.
Technical textiles' future rests in developing comprehensive solutions that tackle global issues rather than just designing fabrics. Textiles will become more intelligent, adaptable, and ecologically conscious as a result of developments in AI, IoT, and eco-friendly materials. In the end, they will be crucial in creating a society that is safer, healthier, and more interconnected.

NATURAL FIBERS IN CONVENTIONAL TEXTILES: RENEWED FOCUS ON SUSTAINABILITY AND BIODEGRADABILITY

Ms. K. Sukasri
School of Fashion, I B.Sc CDF, A.V.P. College of Arts and Science, Tirupur,Tamilnadu. India.
Ms. R. Dharani
School of Fashion, Assistant Professor, A.V.P. College of Arts and Science, Tirupur,Tamilnadu. India.

Abstract

The textile industry is undergoing a paradigm shift towards sustainability, driven by growing concerns over environmental degradation, resource depletion, and waste management. Natural fibers—such as cotton, flax, hemp, jute, and bamboo—are emerging as viable alternatives to synthetic fibers, which dominate the global textile market but are associated with non-biodegradability and excessive carbon footprints. This paper explores the role of natural fibers in the modern textile industry, emphasizing their environmental benefits, biodegradability, and sustainability potential. We examine the properties of various natural fibers, their advantages in comparison to synthetic fibers, and the challenges in scaling up their use in conventional textiles. Case studies of successful implementations and innovations in the use of natural fibers are presented, highlighting advancements in fiber processing, performance enhancement, and eco-friendly dyeing techniques. The paper concludes with a discussion of the future directions for natural fiber adoption in textiles and its potential to contribute to a more sustainable and circular economy.

Keywords: Natural fibers, sustainability, biodegradability, eco-friendly textiles, conventional textiles, circular economy, fiber processing, textile industry, renewable resources, sustainable fashion.

1. Introduction

The textile industry, one of the largest global industries, is increasingly being scrutinized for its substantial environmental impact, particularly due to the widespread use of synthetic fibers derived from petrochemicals. These fibers, including polyester, nylon, and acrylic, are non-biodegradable, leading to significant waste accumulation in landfills and oceans. Additionally, the production of synthetic fibers contributes to greenhouse gas emissions, resource depletion, and pollution.

In contrast, natural fibers, which have been used for millennia in clothing, textiles, and other applications, are biodegradable and derived from renewable resources. Over the last few decades, there has been a renewed focus on the use of natural fibers in textiles as part of the broader movement towards sustainability. This shift aims to address the growing environmental concerns associated with synthetic fibers while capitalizing on the benefits of natural fibers, such as low energy consumption in production, reduced carbon footprint, and biodegradability.

This paper provides an overview of the role of natural fibers in conventional textiles, highlighting their sustainability and biodegradability. It also investigates the current state of natural fiber adoption in the textile industry and examines the challenges and opportunities associated with scaling their use in mass production.

2. Natural Fibers in Textiles: A Sustainable Alternative

2.1 Types of Natural Fibers

Natural fibers can be classified into two primary categories: plant fibers and animal fibers. Each category has distinct properties and applications.

Plant Fibers: These fibers are obtained from various plant species and are typically composed of cellulose. Common plant fibers include:

Cotton: The most widely used natural fiber in the textile industry, known for its softness, breathability, and versatility.

Flax (Linen): Renowned for its strength and durability, flax has applications in both fashion and home textiles.

Hemp: Known for its high strength, durability, and rapid growth, hemp is increasingly being used in eco-friendly textiles.

Jute: Often used for burlap and sacks, jute is a low-cost, biodegradable fiber with minimal environmental impact.

Bamboo: A fast-growing plant that yields fibers with antimicrobial properties, bamboo is gaining popularity in eco-friendly textiles.

Animal Fibers: These fibers are obtained from animals and are typically composed of proteins, such as keratin or fibroin. Prominent animal fibers include:

Wool: Sourced from sheep, wool is highly versatile, offering thermal insulation and moisture-wicking properties.

Silk: Produced by silkworms, silk is prized for its luxurious texture and sheen.

2.2 Environmental Benefits of Natural Fibers

Natural fibers are inherently more sustainable than synthetic fibers due to several key characteristics:

1. **Biodegradability:** One of the most significant advantages of natural fibers is their biodegradability. Unlike synthetic fibers, which can persist in the environment for hundreds of years, natural fibers break down more rapidly in landfills and the natural environment, reducing the long-term impact on ecosystems.
2. **Renewability:** Most natural fibers come from renewable sources, such as plants and animals. These resources can be replenished annually or seasonally, making them a sustainable alternative to non-renewable petroleum-based fibers.
3. **Lower Carbon Footprint:** The cultivation and processing of natural fibers generally consume less energy and produce fewer greenhouse gas emissions compared to the production of synthetic fibers. For instance, hemp and flax require minimal pesticide use and have low water requirements compared to conventional crops like cotton.
4. **Water Usage and Pollution:** While the cultivation of cotton is known to be water-intensive, the use of organic cotton, hemp, and other less resource-hungry fibers can help mitigate water scarcity concerns. Additionally, natural fibers often require fewer chemicals in processing, reducing the amount of pollution released into water sources.

3. Challenges in the Adoption of Natural Fibers

While the use of natural fibers in textiles offers several environmental benefits, challenges remain in the widespread adoption of these fibers. These challenges include:

3.1 Limited Scalability

The production of natural fibers, such as hemp and flax, is often limited by regional factors, including climate and soil conditions. Expanding production to meet global textile demand requires overcoming agricultural limitations and optimizing supply chains to ensure consistent fiber availability.

3.2 Durability and Performance

Natural fibers, while biodegradable, may not always meet the durability and performance standards expected of modern textiles. For instance, cotton can lose its shape and

strength over time, while some natural fibers are more susceptible to pests or environmental degradation. Innovations in fiber processing and hybrid fibers (combining natural and synthetic fibers) are being explored to address these issues.

3.3 Processing and Dyeing Techniques

Processing natural fibers into textiles often requires specialized machinery and techniques. Furthermore, many natural fibers are prone to color fading, which necessitates eco-friendly, non-toxic dyeing techniques. The use of natural dyes is growing but still faces challenges related to color fastness and consistency.

3.4 Cost and Market Competition

Natural fibers can be more expensive to produce compared to synthetic alternatives, due to factors such as lower yields, higher labor costs, and limited infrastructure. This price disparity often makes natural fiber textiles less competitive in cost-sensitive markets.

4. Case Studies and Innovations in Natural Fiber Textiles

Several companies and research groups are pushing the boundaries of natural fiber use in textiles, leading to innovative solutions in production, processing, and applications.

1. **Organic Cotton and Hemp in Fashion**: Leading fashion brands like Patagonia and Stella McCartney are increasingly using organic cotton and hemp blends in their clothing lines. These fibers offer an eco-friendly alternative to conventional cotton and polyester, with a reduced environmental footprint in terms of both production and end-of-life disposal.
2. **Bio-based and Hybrid Fibers**: Some companies are developing hybrid fibers, blending natural fibers with biodegradable synthetic polymers to create textiles that retain the strength and durability of traditional fibers while improving the environmental benefits. For example, bio-polyester fibers mixed with flax offer enhanced durability and biodegradability.
3. **Eco-Friendly Dyeing Technologies**: Companies are also developing sustainable dyeing techniques that use natural plant-based dyes or closed-loop systems to minimize water and chemical usage. These technologies help reduce the ecological impact of textile finishing processes, which have traditionally been highly polluting.

5. Future Directions and Conclusion

Natural fibers are poised to play a critical role in the future of sustainable textiles. With growing consumer demand for eco-friendly products and increased awareness of environmental issues, the adoption of natural fibers in conventional textiles will likely accelerate. Continued innovation in fiber processing, performance enhancement, and sustainable dyeing methods will be crucial to overcoming existing challenges.

The transition towards a more sustainable textile industry also requires collaboration among stakeholders, including farmers, textile manufacturers, designers, and policymakers. Building infrastructure for natural fiber production, improving supply chain transparency, and promoting circular economy models will be essential for ensuring the scalability of natural fiber textiles.

Abstract

Textiles are inseparable from human existence, serving purposes that extend far beyond clothing. They provide comfort, protection, and identity while shaping culture, economy, and technology. From traditional handloom fabrics that preserve heritage to technical textiles used in sports, healthcare, and smart wearables, textiles have evolved with changing human needs. This paper explores the multifaceted role of textiles in daily life—covering basic necessities, cultural identity, healthcare, industrial applications, and sustainability. The discussion also highlights how environmental challenges such as fast fashion and textile waste demand ecofriendly innovations. By examining these aspects, the presentation emphasizes that textiles are not just everyday objects but dynamic tools influencing lifestyles, economic growth, and the future of sustainable living.

Keywords

Textiles, Clothing, Protection, Household fabrics,Healthcare textiles

Introduction

Textiles are one of the oldest and most essential creations of humankind, serving as a bridge between basic survival needs and cultural expression. From the earliest use of animal skins and plant fibers for protection, to the modern era of smart fabrics and eco-friendly innovations, textiles have remained central to human life. They are not limited to clothing alone but extend into nearly every aspect of daily living—providing comfort in homes, ensuring safety in workplaces, enabling advancements in healthcare, and sustaining traditions through cultural attire.

The significance of textiles lies in their dual role: functional and symbolic. On the functional side, they shield the human body from external elements, support hygiene, and enhance living standards. On the symbolic side, they carry social, cultural, and emotional value, often representing identity, tradition, and community. Furthermore, the textile industry contributes heavily to the global economy, providing employment to millions and shaping international trade.

Concept

The concept of textiles in everyday life is rooted in their ability to combine functionality, comfort, and cultural identity. At the most basic level, textiles satisfy the need for protection from climate and environmental hazards. On a broader scale, they act as cultural artifacts that symbolize heritage and individuality. Modern innovations extend the concept to include technical textiles (for sports, automobiles, and defense), smart textiles (with sensors and electronics), and sustainable textiles (eco-friendly fibers designed to reduce environmental impact).

Thus, textiles are not just fabrics—they are tools that influence survival, lifestyle, economics, culture, and future innovation.

Definition

Textiles may be defined as flexible materials produced by interlacing fibers, yarns, or filaments through processes such as weaving, knitting, crocheting, or bonding. In simple terms, textiles are fabric-based products created for diverse uses ranging from clothing and furnishing to industrial and medical applications.

When viewed in the context of everyday life, textiles encompass all fabric-related products—garments, home furnishings, hygiene goods, technical fabrics, and cultural artifacts—that directly or indirectly influence human living standards.

Scope of Textiles in Everyday Life

The scope of textiles is remarkably vast and multifaceted. It covers the following major areas:

1. Clothing and Personal Protection

Clothes are the most visible use of textiles. They regulate temperature, shield against external conditions, and allow self-expression.

Seasonal textiles (cotton in summer, wool in winter, and synthetics for rain protection) enhance adaptability.

Uniforms, professional wear, and protective clothing highlight the link between textiles and occupational identity.

2. Household Textiles

Curtains, carpets, bedsheets, sofa covers, and towels provide comfort and aesthetics.

Functional textiles such as flame-retardant upholstery and waterproof fabrics ensure safety.

Interior textiles reflect cultural taste and modern lifestyle choices.

3. Healthcare and Hygien

Medical textiles include bandages, surgical gowns, gloves, face masks, PPE kits, and disposable sheets.

Hygiene textiles such as sanitary napkins, diapers, and wipes are crucial for daily well-being.

Smart medical textiles now integrate sensors for patient monitoring.

4. Cultural and Social Dimensions

Textiles preserve traditions—sarees in India, kimono in Japan, kilt in Scotland, and abayas in the Middle East.

Festivals and rituals are marked by special fabrics, colors, and embroidery.

Handloom weaving and embroidery protect indigenous skills and provide identity to communities.

5. Economic and Industrial Role

The textile sector is one of the world's largest employers, especially in developing nations.

Exports of garments and fabrics contribute significantly to GDP.

Cottage industries, handlooms, and handicrafts sustain rural economies.

6. Technical Textiles

Sportswear with stretchable, breathable materials supports athletes.

Automotive textiles include airbags, seat covers, insulation, and filters.

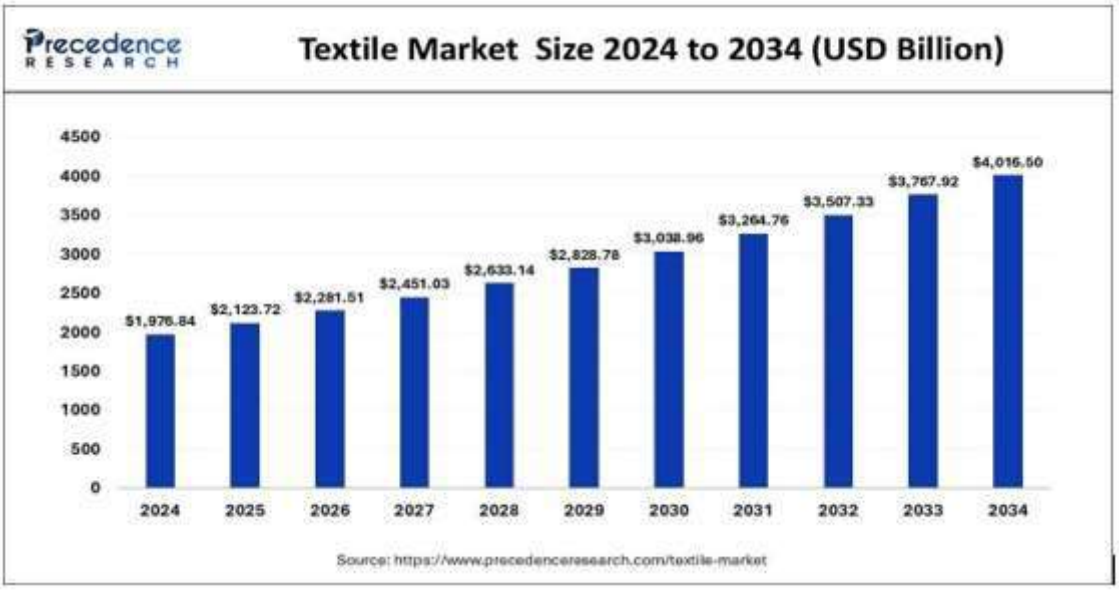
Industrial textiles provide conveyor belts, ropes, filtration fabrics, and protective clothing.

Agricultural textiles (agro-textiles) regulate temperature and protect crops.

7. Smart and Innovative Textiles

Wearables with embedded electronics for fitness monitoring.

Fabrics with LEDs or heating elements for fashion and utility.



Self-cleaning and antibacterial fabrics.

8. Environmental and Sustainable Textiles

Recycling and upcycling old garments reduce waste.

Organic fibers such as bamboo, hemp, and organic cotton minimize ecological impact.

The circular economy promotes eco-friendly fashion trends

Limitations of Textiles in Everyday Life

Despite their significance, textiles face multiple challenges:

1. Environmental Damage

Textile industries are among the largest polluters due to dyeing, bleaching, and chemical finishing.

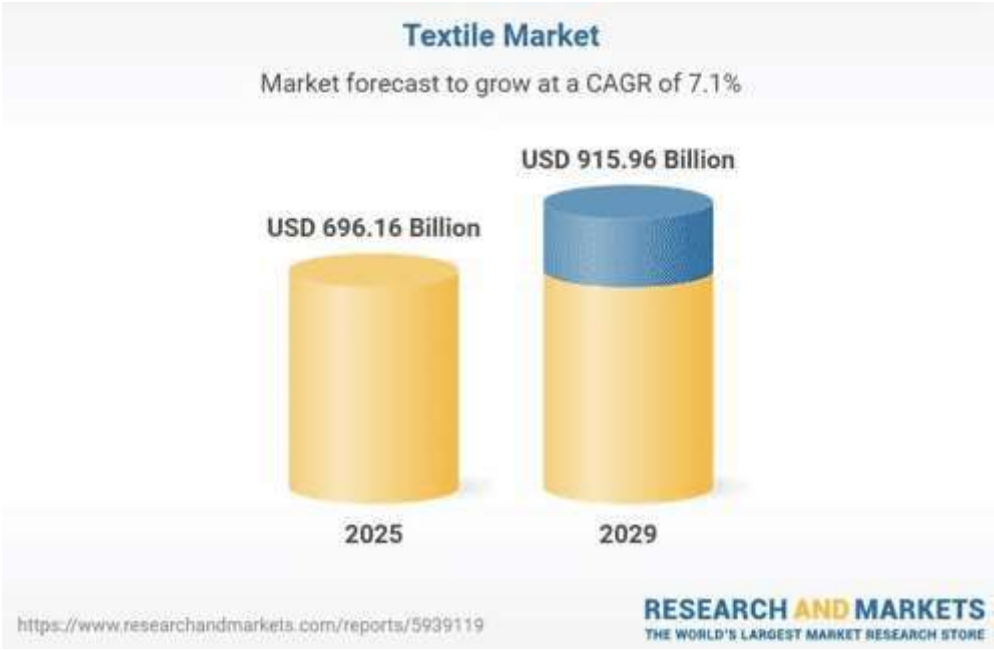
Synthetic fibers like polyester release microplastics into oceans.

2. Textile Waste

Fast fashion encourages overconsumption, leading to short product life cycles and large landfill waste.

3. High Cost of Innovation

Smart textiles and advanced technical fabrics remain expensive and are not widely accessible.



4. Decline of Traditional Practices Globalization and mass production threaten handloom weavers and artisans.

5. Resource Dependency

Textile production requires massive water, energy, and raw material resources, putting pressure on sustainability.

6. Durability Issues

Some fabrics wear out quickly, leading to frequent replacement and waste generation.

Advantages of Textiles in Everyday Life

Basic Protection and Comfort

Clothes regulate body temperature and provide security from external conditions.

Cultural Preservation

Textiles keep alive traditional crafts and act as identity markers.

3. Economic Growth

The textile industry creates employment across all levels—from farmers growing cotton to high-tech engineers developing smart fabrics.

Healthcare Benefits

Medical textiles prevent infections, aid recovery, and save lives.

Industrial Applications

Technical textiles improve safety in automobiles, construction, and defense.

Innovation Potential

Smart fabrics and eco-friendly fibers are redefining modern lifestyles.

Accessibility and Versatility

Textiles are universally used, crossing barriers of geography, class, and culture.

Disadvantages of Textiles in Everyday Life

1. Pollution and Waste

Non-biodegradable Fibers create long-term environmental hazards.

Textile dyeing and finishing contaminate water sources.

2. Fast Fashion Issues

Encourages disposable culture, increasing environmental degradation.

Exploitation of cheap labor in developing countries.

3. High Maintenance Costs

Certain textiles require dry cleaning, careful washing, or ironing, which adds to household expenses.

4. Economic Fluctuations

Dependence on global trade exposes the industry to market instability.

5. Limited Reach of Advanced Textiles
Smart fabrics and sustainable textiles are still niche products, inaccessible to rural or low-income populations.

ACOUSTIC TEXTILES FOR THE 21ST CENTURY: ENHANCING SOUNDSCAPES THROUGH SUSTAINABLE DESIGN

Ms. R. Nisha
Assistant Professor, Department of Costume Design and Fashion,
Hindusthan College of Arts and science, Coimbatore
Dr.U.Ratna
Associate Professor, Avinashilingam Institute for Home Science and Higher education for Women, Coimbatore

Abstract
In an increasingly urbanized and industrialized world, noise pollution has become a critical environmental and social concern. Traditional soundproofing solutions, though effective, often compromise sustainability, aesthetics, and flexibility. Acoustic textiles—engineered fabrics designed to absorb, diffuse, or insulate sound—are emerging as an innovative, eco-friendly alternative. This paper explores the role of acoustic textiles in the 21st century, highlighting their material science, production techniques, and applications in architecture, transportation, and lifestyle. A particular focus is placed on sustainable fibers, eco-conscious manufacturing methods, and smart textile innovations that integrate technology for adaptive sound management. Case studies and recent advancements demonstrate how acoustic textiles not only reduce noise but also enhance well-being, design, and energy efficiency. The paper concludes by emphasizing the potential of acoustic textiles in shaping sustainable soundscapes for modern living environments.
Keywords: Acoustic textiles, sound absorption, sustainable design, noise pollution, smart textiles, architecture, eco-materials.

Introduction

The 21st century is characterized by rapid urbanization, dense living environments, and increased exposure to noise pollution from transportation, construction, and industrial activity. The World Health Organization (WHO) has identified environmental noise as a significant health risk, associated with stress, hearing impairment, and reduced productivity. Conventional soundproofing solutions, such as foams, panels, and heavy insulation, offer acoustic benefits but are often non-recyclable, energy-intensive, and aesthetically limiting.

Textiles, due to their porous structures, flexibility, and customizability, present a unique solution for acoustic management. Acoustic textiles are specially engineered fabrics designed to control reverberation, absorb unwanted noise, and enhance soundscapes while aligning with modern needs for sustainability and multifunctionality. With applications in architecture, interiors, automotive design, and public spaces, acoustic textiles are increasingly integrated into urban planning and lifestyle products. This paper examines the role of acoustic textiles in the modern era, with a focus on materials, structures, performance mechanisms, sustainability approaches, and future directions.

Literature Review

Acoustic Principles of Textiles

Acoustic textiles work primarily through:

Porous absorption: Sound waves enter the pores of the fabric and lose energy through friction.

Resonant absorption: Specific fabric structures resonate at certain frequencies, trapping sound.

Diffusion: Textiles scatter sound waves, reducing echoes.

The absorption coefficient of a textile depends on fiber type, density, thickness, porosity, and finishing techniques.

Historical Context

Historically, textiles such as tapestries, carpets, and drapes were used in palaces and theaters to dampen sound. In the 20th century, synthetic foams and mineral wool dominated acoustic solutions. The 21st century, however, has brought a return to textiles due to sustainability, design integration, and advancements in fiber technology.

Sustainability Dimensions

Growing environmental concerns have shifted attention to eco-friendly fibers (wool, hemp, bamboo, jute, recycled PET) and low-impact finishing methods. Recent studies emphasize circular design, where acoustic textiles are recyclable and biodegradable.

Methodology & Materials

This section summarizes the materials and methods used in acoustic textile development.

Fiber Materials

Natural fibers: Wool and hemp provide high porosity and thermal comfort. Wool naturally traps sound waves due to its crimped structure.

Synthetic fibers: Polyester and nylon provide strength and durability, often combined with natural fibers.

Recycled fibers: PET from plastic bottles has become widely used in acoustic panels.

Bio-based fibers: Banana, pineapple leaf fiber (PALF), and bamboo are emerging eco-materials.

Fabric Structures

Woven: Dense, strong, and suitable for wall panels.

Nonwoven: Highly porous, excellent for insulation.

Knitted: Elastic, lightweight, used in curtains and automotive interiors.

Acoustic Finishing Techniques

Nanocoatings for enhanced porosity and antimicrobial properties.

Fire-retardant finishes for safety in public buildings.

Eco-friendly dyes and prints to reduce environmental footprint.

Performance Evaluation

Reverberation Time (RT60) measurement in controlled spaces.

Absorption Coefficient (α) testing using impedance tubes or reverberation rooms (ISO 354 standard).

Durability Testing: Resistance to wear, UV, and cleaning.

Applications

Architecture and Interiors

Acoustic textiles are widely used in theaters, offices, classrooms, and healthcare facilities.

Fabric wall panels, ceiling baffles, and curtains reduce echoes while complementing interior aesthetics.

Transportation

Automotive and aerospace industries use acoustic seat covers, carpets, and headliners to reduce engine and traffic noise, enhancing passenger comfort.

Industrial and Commercial Use

In factories, recording studios, and conference halls, acoustic barriers made from nonwoven composites replace heavy soundproofing panels.

Lifestyle and Fashion

Wearable acoustic textiles are emerging, particularly for outdoor clothing and uniforms that integrate noise reduction and smart sensors for noise monitoring.

Sustainability in Acoustic Textiles

Eco-Fiber Innovations

Wool, hemp, jute, and kenaf are biodegradable alternatives to synthetic foams.
Recycled PET acoustic panels save up to 80% of energy compared to virgin fiber production.

Green Manufacturing Techniques

Plasma treatments replace chemical finishing.
Digital printing reduces water consumption.
Natural dyes improve biodegradability.

Circular Economy Approaches

Design for recyclability ensures textiles can re-enter fiber loops.
Life Cycle Assessment (LCA) studies show acoustic textiles have significantly lower carbon footprints than conventional soundproofing boards.

Case Studies

Case Study 1 – Office Buildings (Europe, 2022)
Use of wool-based acoustic wall panels reduced reverberation by 45% and improved employee productivity scores.
Case Study 2 – Automotive Interiors (Japan, 2023)
Hybrid polyester–natural fiber composites reduced cabin noise levels by 6–8 dB, while lowering material costs by 15%.
Case Study 3 – Public Auditoriums (India, 2024)
Banana fiber acoustic curtains provided comparable performance to synthetic fabrics while being 100% biodegradable.

Future Prospects

Smart Acoustic Textiles: IoT-enabled fabrics that adapt absorption levels based on real-time sound monitoring.
Nanotechnology: Nano-fibers and nano-porous coatings for enhanced absorption and durability.
AI-Driven Design: Computational models for optimizing fabric geometry and structure.
Multi-Functional Fabrics: Combining thermal, acoustic, and antimicrobial properties in one textile.

Conclusion

Acoustic textiles represent a significant advancement in both material science and sustainable design. Their versatility allows them to integrate seamlessly into modern architecture, transportation, and lifestyle products, providing not only acoustic comfort but also environmental benefits. As noise pollution intensifies, and sustainability becomes non-negotiable, acoustic textiles are set to play a central role in designing healthier, quieter, and greener environments for the 21st century.

NANOSCIENCE AND TECHNOLOGY IN TEXTILES: REVOLUTIONIZING THE FABRIC OF THE FUTURE

Ms.J.Gowri
School of Fashion, A.V.P College of Arts and Science, Tirupur, Tamil Nadu, India.
Dr.S.Divya
Department of Costume Design and Fashion, Assistant Professor & Head i/c ,Kongunadu Arts and Science College, Coimbatore, Tamil Nadu, India.

Abstract

Nanotechnology has brought about significant innovations in various industries, and the textile sector is no exception. Nanoscience and Technology in textiles focuses on the application of nanomaterials and nanoscale processes to enhance the performance and functionality of fabrics. The integration of nanotechnology in textiles has resulted in advanced features such as self-cleaning fabrics, enhanced durability, antimicrobial properties, and improved comfort. This paper provides an overview of the key applications of nanotechnology in textile manufacturing, the methods used for incorporating nanomaterials into textiles, and the future prospects of nano-enhanced fabrics. Additionally, it addresses the challenges and potential environmental concerns associated with the widespread use of nanotechnology in textiles. The ongoing developments promise not only a revolution in textile manufacturing but also the creation of highly functional and sustainable materials that meet the demands of modern consumers.

Keywords: Nanotechnology, Smart Fabrics, Self-Cleaning Fabrics, Antimicrobial Textiles, Sustainability, Nano-enhanced Fabrics.

INTRODUCTION

The textile industry is one of the oldest and largest manufacturing sectors globally. With the increasing demand for functional, high-performance fabrics, the integration of Nanotechnology into textiles has emerged as a game-changing innovation. Nano Science and Technology (NST) in textiles involves the manipulation of materials at the nanoscale (1–100 nanometers) to create fabrics with enhanced properties such as durability, stain resistance, antibacterial action, and improved comfort. These advancements have opened up new possibilities for creating fabrics that respond to environmental stimuli, have self-repairing properties, and even possess the ability to detect external threats. This paper reviews the current state of nanotechnology in textiles, its applications, and future directions for research and commercialization.

2. Basics of Nanotechnology in Textiles

2.1 Nanomaterials in Textiles

Nanomaterials, such as nanoparticles, nanotubes, and nanofibers, are integral to nano-enhanced textiles. These materials have unique properties at the nanoscale, including high surface area, enhanced mechanical strength, and specific interactions with light, heat, and chemicals. Common nanomaterials used in textiles include:

Silver Nanoparticles: Known for their antimicrobial properties, silver nanoparticles are commonly used to create odor-resistant and bacteria-resistant fabrics.

Carbon Nanotubes: These are used to enhance the strength, flexibility, and conductivity of fabrics, making them ideal for applications in smart textiles.

Nanoclay and Nano-oxides: These materials are incorporated into fibers to enhance properties like UV protection, water resistance, and flame retardancy.

2.2 Fabrication Techniques

Several techniques are employed to incorporate nanomaterials into textiles:

Sol-gel Process: This is a versatile method to create nano-coatings for fabrics. It involves the transformation of a sol (a colloidal solution) into a gel, which is then applied to the fabric surface.

Electrospinning: A technique used to produce nanofibers by applying a high-voltage electrical field to a polymer solution, creating ultra-fine fibers that are incorporated into textiles for lightweight, breathable fabrics.

Nanoparticle Deposition: Nanoparticles can be applied to the surface of fabrics through dipping, spraying, or coating methods. These nanoparticles then form a thin film on the fabric that imparts desirable properties.

3. Applications of Nanotechnology in Textiles

3.1 Smart Textiles and Wearable Technology

Smart textiles are fabrics that can sense and respond to external stimuli such as heat, light, moisture, or pressure. With the advent of nanotechnology, these textiles are becoming increasingly sophisticated. For example, fabrics embedded with nanomaterials can change color based on temperature, offering potential applications in fashion and sportswear. Moreover, smart textiles can be integrated with electronic devices to monitor health parameters such as heart rate, body temperature, and movement.

3.2 Self-Cleaning and Stain-Resistant Fabrics

One of the most practical applications of nanotechnology in textiles is the creation of self-cleaning fabrics. By applying hydrophobic (water-repelling) nanoparticles, textiles can resist dirt and stains. The incorporation of nanomaterials like titanium dioxide allows fabrics to break down organic stains when exposed to UV light, making them easier to clean and maintain. This innovation is particularly beneficial for outdoor and high-performance clothing.

3.3 Antimicrobial and Antibacterial Textiles

Nanotechnology has been leveraged to create textiles with inherent antibacterial and antimicrobial properties. Silver nanoparticles, in particular, are widely used for this purpose, as they inhibit the growth of bacteria and fungi. This is especially useful in medical textiles, sportswear, and consumer clothing, where hygiene and odor control are important. These textiles can prevent the growth of harmful microorganisms, extending the life of garments and reducing the risk of infections in healthcare settings.

3.4 UV Protection and Flame Retardancy

Nanotechnology has made it possible to enhance the UV protection properties of textiles. By incorporating nano-sized zinc oxide or titanium dioxide particles, textiles can effectively block harmful UV radiation. Similarly, flame-retardant textiles are produced by embedding nanomaterials like phosphorus or nanoclays that impart fire-resistant properties without compromising the fabric's texture or flexibility. These advancements are important in industries like automotive, aerospace, and protective wear.

3.5 Enhanced Comfort and Breathability

Nanotechnology can be used to improve the comfort and breathability of textiles. Nano-coatings allow fabrics to wick moisture away from the skin, while nanofibers can enhance the softness and flexibility of fabrics without adding weight. Additionally, nano-treated fabrics can regulate body temperature, offering improved thermal comfort in clothing for both extreme cold and hot environments.

4. Challenges and Limitations

4.1 Environmental and Health Concerns

The widespread use of nanomaterials in textiles raises potential environmental and health concerns. The release of nanoparticles into the environment during the manufacturing process or after washing could pose risks to aquatic life and ecosystems. Similarly, concerns about the

long-term exposure to nanoparticles on human health, particularly in relation to inhalation or skin absorption, have been highlighted in research. Thus, further studies are needed to assess the safety and environmental impact of nano-enhanced textiles.

4.2 Cost and Scalability

While the benefits of nanotechnology in textiles are clear, the cost of incorporating nanomaterials into textile production remains high. The manufacturing processes for producing nano-enabled fabrics are often complex and expensive, limiting their widespread adoption. However, as technology improves and economies of scale are realized, the cost of production is expected to decrease.

5. Future Directions

Nanotechnology holds immense potential for the textile industry in the coming years. Future developments may lead to the creation of textiles that are not only smarter and more functional but also more sustainable. For example, biodegradable nanomaterials and eco-friendly production processes could be used to create textiles that offer high performance without harming the environment. Additionally, the integration of nanotechnology with advanced textile recycling methods may enable the creation of fully recyclable smart fabrics.

6. Nano-Enhanced Functional Characteristics of Fabrics

Nanoparticles like silver, zinc oxide, and titanium dioxide grant fabrics antimicrobial activity, UV protection, odor resistance, and self-cleaning abilities. Nano-coatings and surface modifications further enable water and stain resistance, wrinkle prevention, and flame retardant properties, drastically boosting textile lifespan and comfort.

6.1 Mechanisms and Processes

Electrospinning: Generates ultrafine nanofibers for enhanced strength and breathability.
Sol-Gel Coating and Dip Coating: Apply nanoparticles uniformly to textile surfaces for long-lasting, functional finishes.
Plasma Treatment: Alters fiber surfaces to improve nanomaterial adherence and performance.

6.2 Smart and Multifunctional Textiles

Nanotechnology is catalyzing the rise of smart textiles, which integrate nanosensors and nanoelectronic devices with traditional fibers. These fabrics can monitor vital signs, enable on-body circuitry, and even harvest energy through embedded nanomaterials such as carbon nanotubes or graphene. Applications span wearable health monitors, sports garments, military gear, and environmental protection.

6.3 Sustainability Impact

Nanotechnology-driven textiles contribute to environmental sustainability by:
Reducing water, energy, and detergent consumption through self-cleaning and antimicrobial properties.
Promoting the use of biodegradable and eco-friendly nanomaterials.
Extending fabric durability to minimize waste and promote circular economy principles.

Challenges and Future Trends

Despite remarkable advancements, several challenges remain:
Ensuring the safety and biocompatibility of nano materials for wearers and workers.
Addressing environmental and regulatory concerns about nanomaterial persistence and toxicity.
Scaling up cost-effective and sustainable manufacturing processes for widespread nano-fabric adoption.
Ongoing research focuses on sustainable nanotechnology, recyclable smart textiles, and robust regulatory frameworks to drive safe, responsible, and innovative progress in the field.

8. Conclusion

Nanoscience and Technology in textiles is transforming the fabric of the future. By enabling the development of fabrics with enhanced properties such as self-cleaning, antimicrobial action, and smart functionalities, nanotechnology is poised to revolutionize the textile industry. While challenges remain in terms of cost, scalability, and environmental impact, the potential benefits of nano-enhanced textiles make it a promising field for future research and commercialization. The continued advancement of nanotechnology in textiles will likely result in a new era of high-performance, sustainable, and multifunctional fabrics.

DIGITAL REVOLUTION IN TEXTILES AND FASHION: EXPLORING THE ROLE OF CAD AND CAM

V. Deepa
Assistant Professor, Department of Costume Design and Fashion,
Hindusthan College of Arts & Science, Coimbatore.
Dr.S.Kavitha
Professor, Department of Home Science (Textiles and Clothing),
Mother Teresa Womens University, Research and Extension centre, Coimbatore.

Abstract
The integration of Computer-Aided Design (CAD) and Computer-Aided Manufacturing (CAM) technologies has revolutionized the textiles and fashion industry, transforming traditional workflows and enabling unprecedented levels of efficiency, precision, and creativity. CAD facilitates detailed digital design, pattern making, and 3D visualization, while CAM ensures streamlined production through automated cutting, sewing, and quality control. Together, these technologies minimize waste, reduce production timelines, and foster sustainability by optimizing resource utilization.
This paper delves into the diverse applications of CAD and CAM, such as virtual prototyping, textile design, automated cutting, and data management. It highlights their significant benefits, including cost savings, enhanced creativity, improved product quality, and alignment with sustainability goals. However, challenges such as high initial investment, training requirements, and system integration remain barriers to widespread adoption.
Emerging trends, including the integration of artificial intelligence (AI), augmented reality (AR), virtual reality (VR), cloud computing, and the Internet of Things (IoT), are poised to further enhance CAD and CAM capabilities. These advancements promise to redefine the design-to-manufacturing workflow, enabling a more innovative, sustainable, and collaborative future for the industry. As digital transformation accelerates, CAD and CAM technologies remain critical to driving progress and shaping the future of textiles and fashion.

1.INTRODUCTION

The textiles and fashion industry is inherently dynamic, driven by ever-changing consumer preferences, technological advancements, and the need for sustainability. Traditional processes often relied on manual efforts that were time-consuming and prone to errors. The advent of CAD and CAM technologies has addressed these challenges by automating and optimizing various stages of the production cycle, from design conceptualization to manufacturing.
CAD focuses on creating detailed and accurate digital designs for textiles and garments, enabling designers to visualize their creations in 2D or 3D. CAM, on the other hand, translates these designs into precise manufacturing instructions, streamlining the production process. Together, these technologies have redefined the industry's workflow, fostering innovation and improving competitiveness.

2. APPLICATIONS OF CAD AND CAM IN TEXTILES AND FASHION

2.1. Design Development

CAD systems facilitate the creation of original designs or the adaptation of existing artworks. Designers can easily draw, modify, and visualize their concepts using various tools within CAD software. This capability is essential for experimenting with different patterns, colors, and textures without the need for physical prototypes. For instance, designers can manipulate elements like size and orientation directly within the software, significantly reducing lead times

associated with traditional design methods16. in a virtual environment, eliminating the need for physical prototypes.

2.2. Pattern Making and Grading

Pattern making is a crucial phase in garment production. Traditional pattern-making processes are labor-intensive and require skilled artisans. CAD software simplifies this process by providing tools for creating accurate patterns that can be easily adjusted for different sizes through grading. This functionality ensures that garments fit well across various body types while maintaining design integrity. The ability to store and reuse pattern blocks further enhances efficiency, allowing designers to develop new collections more rapidly

Advantages:

- Ensures accuracy and consistency across all sizes.
- Saves time by automating repetitive tasks.
- Facilitates easy modifications to existing patterns.

2.3. 3D Visualization and Virtual Prototyping

One of the most significant advancements brought by CAD is the ability to create 3D visualizations of garments. Designers can simulate how fabrics will drape on a body, allowing for better assessment of fit and style before physical samples are produced. Virtual prototyping reduces waste associated with sample production and enables quick iterations based on feedback from stakeholders

2.4. Textile Design

CAD systems enable the creation of intricate textile patterns and designs, allowing designers to experiment with motifs, repeats, and colour ways. Digital printing technology further complements this by bringing these designs to life with high precision.

Applications:

- Designing jacquard and printed fabrics.
- Customizing designs for specific markets or customers.

2.5. Fabric Simulation and Analysis

CAD software also includes features for simulating fabric properties such as texture, weight, and stretch. This capability allows designers to evaluate how different materials will behave in a finished garment, leading to more informed material selections. Additionally, tools for color management help ensure that colors are accurately represented in both digital designs and final products.

2.6. Integration with CAM Systems

Once designs are finalized in CAD software, they are transferred to CAM systems for manufacturing. This integration automates processes such as cutting fabric according to precise patterns generated by CAD. The use of Computer Numerical Control (CNC) machines ensures high accuracy during cutting, significantly reducing fabric waste compared to manual methods.

2.7. Fashion Show Visualization

3D CAD systems allow designers to create virtual fashion shows, showcasing their collections on digital runways. This innovation has gained traction, especially during the COVID-19 pandemic, when physical events were restricted.

3.APPLICATIONS OF CAM IN TEXTILES AND FASHION

3.1. Automated Cutting Processes

CAM systems automate the cutting process based on the digital patterns created in CAD software. This automation minimizes human error while maximizing precision and speed during production runs. Advanced CAM systems can handle multiple layers of fabric simultaneously, optimizing material usage and reducing production time.

3.2. Sewing Automation

In addition to cutting, CAM technologies facilitate sewing automation through programmable sewing machines that can execute complex stitching patterns based on digital instructions from CAD systems. This capability not only enhances production speed but also ensures consistent quality across large batches of garments.

3.3. Quality Control

CAM systems incorporate quality control measures throughout the manufacturing process. By using sensors and cameras integrated into machinery, manufacturers can detect defects early in production—reducing waste and ensuring that only high-quality products reach consumers.

3.4. Data Management and Workflow Optimization

The integration of CAD/CAM technologies allows for efficient data management throughout the design-to-manufacturing workflow. Real-time data sharing between design teams and production facilities enhances collaboration and enables faster decision-making processes.

4.BENEFITS OF CAD AND CAM IN TEXTILES AND FASHION

4.1. Improved Efficiency

By automating complex and repetitive tasks, CAD and CAM systems significantly reduce production timelines. For example, pattern grading, which traditionally took days, can now be completed in hours.

4.2. Enhanced Creativity

CAD systems provide designers with an extensive toolkit to experiment with new ideas, pushing the boundaries of creativity. Virtual simulations allow for real-time adjustments and visualization of concepts.

4.3. Cost Savings

Automation reduces labor costs and minimizes material waste, leading to substantial cost savings. Additionally, digital prototypes eliminate the need for expensive physical samples.

4.4. Sustainability

Reducing fabric waste and optimizing resource utilization align with the industry's sustainability goals. Digital processes also lower the carbon footprint by minimizing the need for physical transportation of samples.

4.5. Quality Assurance

CAM systems ensure precision and consistency in manufacturing, reducing errors and defects. This leads to higher-quality products and improved customer satisfaction.

5.CHALLENGES IN ADOPTING CAD AND CAM

5.1 High Initial Investment

Implementing CAD and CAM systems requires substantial financial investment in software, hardware, and training. The cost associated with acquiring sophisticated CAD/CAM software and machinery can be significant, particularly for small businesses or startups within the textile industry.

5.2 Learning Curve

The successful implementation of CAD/CAM systems requires skilled personnel who are proficient in using these advanced tools. Designers and operators must be trained to effectively use these systems, which can be time-consuming.

5.3 System Integration

Integrating CAD and CAM with existing workflows and machinery can be complex and may require additional resources. Many companies may face challenges integrating new technologies with legacy systems already in place, which can hinder efficiency gains.

5.4 Data Security

As designs are digitized, protecting intellectual property from cyber threats becomes a critical concern.

6.FUTURE TRENDS

6.1. Artificial Intelligence (AI)

AI is set to enhance CAD and CAM systems by automating complex design processes, predicting trends, and optimizing manufacturing workflows. For instance, AI algorithms can analyze consumer preferences to suggest design modifications.

6.2. Augmented Reality (AR) and Virtual Reality (VR)

AR and VR technologies are being integrated with CAD systems to create immersive design experiences. Designers can visualize garments in real-world settings, and consumers can try on virtual outfits before making a purchase.

6.3. Cloud-Based Solutions

Cloud computing enables real-time collaboration among designers, manufacturers, and retailers across the globe. Cloud-based CAD and CAM systems facilitate seamless data sharing and remote access.

6.4. Integration with IoT

The Internet of Things (IoT) is transforming CAM systems by enabling real-time monitoring of machinery and production processes. IoT sensors provide data on equipment performance, reducing downtime and maintenance costs.

CONCLUSION

The impact of CAD and CAM technologies on the textiles and fashion industry is undeniable. By streamlining design and manufacturing processes, these systems have enhanced efficiency, creativity, and sustainability. While challenges in adoption persist, continuous advancements in AI, AR, and IoT are poised to address these barriers, paving the way for a more innovative and sustainable future. As the industry continues to embrace digital transformation, CAD and CAM technologies will remain at the forefront, driving progress and redefining the possibilities in textiles and fashion.

About the College

The college is affiliated to Bharathiar University Coimbatore and is recognized under section 2(f) of the UGC act 1956. The college was accredited with A grade by NAAC in its first cycle. The college is currently conferred for Autonomy by UGC for 10 years. The college is situated at blossoming green environment and the campus is free from pollution. It has splendid infrastructure with modernized furniture which complements vibrant academic domain. It renders an effective curriculum which unveils the standards and core competencies of the students like analytical abilities, creative thinking and problem solving skills of the students. The college strives to create a suitable arena for all round developments which enable the students to serve the country with great vigor and enthusiasm and also to face challenges. The highly qualified and experienced faculty members are committed to serve the students community to enrich the knowledge of the students. At present, the college offers 14 UG, 4 PG and 4 Research Programmes with the staunch motive of developing research skills. Co-curricular and Extra-curricular activities are conducted in the college at regular intervals and the students are given opportunities to empower themselves and engage in socially useful and productive works through various Cells and Clubs like NSS, Rotaract, Social Awareness Cell, and Women Empowerment Cell and so on.

About the Conference

Second International Conference on Recent Trends in Multidisciplinary Research and Innovation (ICRTMRI -2025) is an event that will provide a tremendous opportunity for the authors, participants, and intellectuals to communicate effectively with one another and express their skills and understanding the recent trends in the research and technical innovations. Potential Attendees at ICRTMRI-2025 will have a great opportunity to speak with experienced professionals about the recent challenges in scientific research and related fields. The International Conference on Multidisciplinary Research and Innovation brings forth a venue for the various key players to connect and collaborate among themselves. This International Conference fosters research presentation, journal publication and professional development.
